- mysqlnd_net_get_methods()
- mysqlnd_protocol_get_methods()

There is no formal definition of what a plugin is and how a plugin mechanism works.

Components often found in plugins mechanisms are:

- A plugin manager
- A plugin API
- Application services (or modules)
- Application service APIs (or module APIs)

The `mysqlnd` plugin concept employs these features, and additionally enjoys an open architecture.

No Restrictions

A plugin has full access to the inner workings of `mysqlnd`. There are no security limits or restrictions. Everything can be overwritten to implement friendly or hostile algorithms. It is recommended you only deploy plugins from a trusted source.

As discussed previously, plugins can use pointers freely. These pointers are not restricted in any way, and can point into another plugin's data. Simple offset arithmetic can be used to read another plugin's data.

It is recommended that you write cooperative plugins, and that you always call the parent method. The plugins should always cooperate with `mysqlnd` itself.

Issues: an example of chaining and cooperation

Extension	mysqlnd.query() pointer	call stack if calling parent
ext/mysqlnd	mysqlnd.query()	mysqlnd.query
ext/mysqlnd_cache	mysqlnd_cache.query()	1. mysqlnd_cache.query() 2. mysqlnd.query
ext/mysqlnd_monitor	mysqlnd_monitor.query()	1. mysqlnd_monitor.query()

		2. mysqlnd_cache.query() 3. mysqlnd.query

In this scenario, a cache (`ext/mysqlnd_cache`) and a monitor (`ext/mysqlnd_monitor`) plugin are loaded. Both subclass `Connection::query()`. Plugin registration happens at `MINIT` using the logic shown previously. PHP calls extensions in alphabetical order by default. Plugins are not aware of each other and do not set extension dependencies.

By default the plugins call the parent implementation of the query method in their derived version of the method.

PHP Extension Recap

This is a recap of what happens when using an example plugin, `ext/mysqlnd_plugin`, which exposes the `mysqlnd` C plugin API to PHP:

- Any PHP MySQL application tries to establish a connection to 192.168.2.29
- The PHP application will either use `ext/mysql`, `ext/mysqli` or `PDO_MYSQL`. All three PHP MySQL extensions use `mysqlnd` to establish the connection to 192.168.2.29.
- `Mysqlnd` calls its connect method, which has been subclassed by `ext/mysqlnd_plugin`.
- `ext/mysqlnd_plugin` calls the userspace hook `proxy::connect()` registered by the user.
- The userspace hook changes the connection host IP from 192.168.2.29 to 127.0.0.1 and returns the connection established by `parent::connect()`.
- `ext/mysqlnd_plugin` performs the equivalent of `parent::connect(127.0.0.1)` by calling the original `mysqlnd` method for establishing a connection.
- `ext/mysqlnd` establishes a connection and returns to `ext/mysqlnd_plugin`. `ext/mysqlnd_plugin` returns as well.
- Whatever PHP MySQL extension had been used by the application, it receives a connection to 127.0.0.1. The PHP MySQL extension itself returns to the PHP application. The circle is closed.

21.10.3.7.5. Getting started building a mysqlnd plugin

Copyright 1997-2012 the PHP Documentation Group.

It is important to remember that a `mysqlnd` plugin is itself a PHP extension.

The following code shows the basic structure of the MINIT function that will be used in the typical `mysqlnd` plugin:

```
/* my_php_mysqlnd_plugin.c */

 static PHP_MINIT_FUNCTION(mysqlnd_plugin) {
  /* globals, ini entries, resources, classes */

  /* register mysqlnd plugin */
  mysqlnd_plugin_id = mysqlnd_plugin_register();

  conn_m = mysqlnd_get_conn_methods();
  memcpy(org_conn_m, conn_m,
    sizeof(struct st_mysqlnd_conn_methods));

  conn_m->query = MYSQLND_METHOD(mysqlnd_plugin_conn, query);
  conn_m->connect = MYSQLND_METHOD(mysqlnd_plugin_conn, connect);
}
```

```
/* my_mysqlnd_plugin.c */

 enum_func_status MYSQLND_METHOD(mysqlnd_plugin_conn, query)(/* ... */) {
  /* ... */
}
enum_func_status MYSQLND_METHOD(mysqlnd_plugin_conn, connect)(/* ... */) {
  /* ... */
}
```

Task analysis: from C to userspace

```
 class proxy extends mysqlnd_plugin_connection {
  public function connect($host, ...) { .. }
}
mysqlnd_plugin_set_conn_proxy(new proxy());
```

Process:

1. PHP: user registers plugin callback
2. PHP: user calls any PHP MySQL API to connect to MySQL
3. C: ext/*mysql* calls mysqlnd method
4. C: mysqlnd ends up in ext/mysqlnd_plugin
5. C: ext/mysqlnd_plugin
    a. Calls userspace callback
    b. Or orginal `mysqlnd` method, if userspace callback not set

You need to carry out the following:

1. Write a class "mysqlnd_plugin_connection" in C
2. Accept and register proxy object through "mysqlnd_plugin_set_conn_proxy()"
3. Call userspace proxy methods from C (optimization - zend_interfaces.h)

Userspace object methods can either be called using `call_user_function()` or you can operate at a level closer to the Zend Engine and use `zend_call_method()`.

Optimization: calling methods from C using zend_call_method

The following code snippet shows the prototype for the `zend_call_method` function, taken from `zend_interfaces.h`.

```
 ZEND_API zval* zend_call_method(
  zval **object_pp, zend_class_entry *obj_ce,
  zend_function **fn_proxy, char *function_name,
  int function_name_len, zval **retval_ptr_ptr,
  int param_count, zval* arg1, zval* arg2 TSRMLS_DC
);
```

Zend API supports only two arguments. You may need more, for example:

```
 enum_func_status (*func_mysqlnd_conn__connect)(
  MYSQLND *conn, const char *host,
  const char * user, const char * passwd,
  unsigned int passwd_len, const char * db,
  unsigned int db_len, unsigned int port,
  const char * socket, unsigned int mysql_flags TSRMLS_DC
);
```

To get around this problem you will need to make a copy of `zend_call_method()` and add a facility for additional parameters. You can do this by creating a set of `MY_ZEND_CALL_METHOD_WRAPPER` macros.

Calling PHP userspace

This code snippet shows the optimized method for calling a userspace function from C:

```
/* my_mysqlnd_plugin.c */

MYSQLND_METHOD(my_conn_class,connect)(
  MYSQLND *conn, const char *host /* ... */ TSRMLS_DC) {
  enum_func_status ret = FAIL;
  zval * global_user_conn_proxy = fetch_userspace_proxy();
  if (global_user_conn_proxy) {
    /* call userspace proxy */
    ret = MY_ZEND_CALL_METHOD_WRAPPER(global_user_conn_proxy, host, /*...*/);
  } else {
```

```
    /* or original mysqlnd method = do nothing, be transparent */
    ret = org_methods.connect(conn, host, user, passwd,
          passwd_len, db, db_len, port,
          socket, mysql_flags TSRMLS_CC);
  }
  return ret;
}
```

Calling userspace: simple arguments

```
/* my_mysqlnd_plugin.c */

 MYSQLND_METHOD(my_conn_class,connect)(
  /* ... */, const char *host, /* ...*/) {
  /* ... */
  if (global_user_conn_proxy) {
    /* ... */
    zval* zv_host;
    MAKE_STD_ZVAL(zv_host);
    ZVAL_STRING(zv_host, host, 1);
    MY_ZEND_CALL_METHOD_WRAPPER(global_user_conn_proxy, zv_retval, zv_host /*, ...*/);
    zval_ptr_dtor(&zv_host);
    /* ... */
  }
  /* ... */
}
```

Calling userspace: structs as arguments

```
/* my_mysqlnd_plugin.c */

MYSQLND_METHOD(my_conn_class, connect)(
  MYSQLND *conn, /* ...*/) {
  /* ... */
  if (global_user_conn_proxy) {
    /* ... */
    zval* zv_conn;
    ZEND_REGISTER_RESOURCE(zv_conn, (void *)conn, le_mysqlnd_plugin_conn);
    MY_ZEND_CALL_METHOD_WRAPPER(global_user_conn_proxy, zv_retval, zv_conn, zv_host /*, ...*/);
    zval_ptr_dtor(&zv_conn);
    /* ... */
  }
  /* ... */
}
```

The first argument of many `mysqlnd` methods is a C "object". For example, the first argument of the connect() method is a pointer to `MYSQLND`. The struct MYSQLND represents a `mysqlnd` connection object.

The `mysqlnd` connection object pointer can be compared to a standard I/O file handle. Like a standard I/O file handle a `mysqlnd` connection object shall be linked to the userspace using the PHP resource variable type.

From C to userspace and back

```
 class proxy extends mysqlnd_plugin_connection {
  public function connect($conn, $host, ...) {
    /* "pre" hook */
    printf("Connecting to host = '%s'\n", $host);
    debug_print_backtrace();
    return parent::connect($conn);
  }

  public function query($conn, $query) {
    /* "post" hook */
    $ret = parent::query($conn, $query);
    printf("Query = '%s'\n", $query);
    return $ret;
  }
}
mysqlnd_plugin_set_conn_proxy(new proxy());
```

PHP users must be able to call the parent implementation of an overwritten method.

As a result of subclassing it is possible to refine only selected methods and you can choose to have "pre" or "post" hooks.

Buildin class: mysqlnd_plugin_connection::connect()

```
/*  my_mysqlnd_plugin_classes.c */

 PHP_METHOD("mysqlnd_plugin_connection", connect) {
  /* ... simplified! ... */
  zval* mysqlnd_rsrc;
```

```
  MYSQLND* conn;
  char* host; int host_len;
  if (zend_parse_parameters(ZEND_NUM_ARGS() TSRMLS_CC, "rs",
    &mysqlnd_rsrc, &host, &host_len) == FAILURE) {
    RETURN_NULL();
  }
  ZEND_FETCH_RESOURCE(conn, MYSQLND* conn, &mysqlnd_rsrc, -1,
    "Mysqlnd Connection", le_mysqlnd_plugin_conn);
  if (PASS == org_methods.connect(conn, host, /* simplified! */ TSRMLS_CC))
    RETVAL_TRUE;
  else
    RETVAL_FALSE;
}
```

21.10.4. MySQL Functions (PDO_MYSQL) (MySQL (PDO))

Copyright 1997-2012 the PHP Documentation Group.

PDO_MYSQL is a driver that implements the PHP Data Objects (PDO) interface to enable access from PHP to MySQL 3.x, 4.x and 5.x databases.

PDO_MYSQL will take advantage of native prepared statement support present in MySQL 4.1 and higher. If you're using an older version of the mysql client libraries, PDO will emulate them for you.

> **Warning**
>
> Beware: Some MySQL table types (storage engines) do not support transactions. When writing transactional database code using a table type that does not support transactions, MySQL will pretend that a transaction was initiated successfully. In addition, any DDL queries issued will implicitly commit any pending transactions.

Use `--with-pdo-mysql[=DIR]` to install the PDO MySQL extension, where the optional `[=DIR]` is the MySQL base install directory. If mysqlnd is passed as `[=DIR]`, then the MySQL native driver will be used.

Optionally, the `--with-mysql-sock[=DIR]` sets to location to the MySQL unix socket pointer for all MySQL extensions, including PDO_MYSQL. If unspecified, the default locations are searched.

Optionally, the `--with-zlib-dir[=DIR]` is used to set the path to the libz install prefix.

```
$ ./configure --with-pdo-mysql --with-mysql-sock=/var/mysql/mysql.sock
```

SSL support is enabled using the appropriate PDO_MySQL constants, which is equivalent to calling the MySQL C API function mysql_ssl_set(). Also, SSL cannot be enabled with `PDO::setAttribute` because the connection already exists. See also the MySQL documentation about connecting to MySQL with SSL.

Table 21.27. Changelog

Version	Description
5.4.0	MySQL client libraries 4.1 and below are no longer supported.
5.3.9	Added SSL support with mysqlnd and OpenSSL.
5.3.7	Added SSL support with libmysql and OpenSSL.

The constants below are defined by this driver, and will only be available when the extension has been either compiled into PHP or dynamically loaded at runtime. In addition, these driver-specific constants should only be used if you are using this driver. Using driver-specific attributes with another driver may result in unexpected behaviour. `PDO::getAttribute` may be used to obtain the `PDO_ATTR_DRIVER_NAME` attribute to check the driver, if your code can run against multiple drivers.

`PDO::MYSQL_ATTR_USE_BUFFERED_QUERY` (integer)
: If this attribute is set to `TRUE` on a `PDOStatement`, the MySQL driver will use the buffered versions of the MySQL API. If you're writing portable code, you should use `PDOStatement::fetchAll` instead.

Example 21.204. Forcing queries to be buffered in mysql

```
<?php
if ($db->getAttribute(PDO::ATTR_DRIVER_NAME) == 'mysql') {
    $stmt = $db->prepare('select * from foo',
        array(PDO::MYSQL_ATTR_USE_BUFFERED_QUERY => true));
} else {
    die("my application only works with mysql; I should use \$stmt->fetchAll() instead
}
?>
```

PDO::MYSQL_ATTR_LOCAL_INFILE (integer)	Enable LOAD LOCAL INFILE. Note, this constant can only be used in the *driver_options* array when constructing a new database handle.
PDO::MYSQL_ATTR_INIT_COMMAND (integer)	Command to execute when connecting to the MySQL server. Will automatically be re-executed when reconnecting. Note, this constant can only be used in the *driver_options* array when constructing a new database handle.
PDO::MYSQL_ATTR_READ_DEFAULT_FILE (integer)	Read options from the named option file instead of from my.cnf. This option is not available if mysqlnd is used, because mysqlnd does not read the mysql configuration files.
PDO::MYSQL_ATTR_READ_DEFAULT_GROUP (integer)	Read options from the named group from my.cnf or the file specified with MYSQL_READ_DEFAULT_FILE . This option is not available if mysqlnd is used, because mysqlnd does not read the mysql configuration files.
PDO::MYSQL_ATTR_MAX_BUFFER_SIZE (integer)	Maximum buffer size. Defaults to 1 MiB. This constant is not supported when compiled against mysqlnd.
PDO::MYSQL_ATTR_DIRECT_QUERY (integer)	Perform direct queries, don't use prepared statements.
PDO::MYSQL_ATTR_FOUND_ROWS (integer)	Return the number of found (matched) rows, not the number of changed rows.
PDO::MYSQL_ATTR_IGNORE_SPACE (integer)	Permit spaces after function names. Makes all functions names reserved words.
PDO::MYSQL_ATTR_COMPRESS (integer)	Enable network communication compression. This is not supported when compiled against mysqlnd.
PDO::MYSQL_ATTR_SSL_CA (integer)	The file path to the SSL certificate authority. This exists as of PHP 5.3.7.
PDO::MYSQL_ATTR_SSL_CAPATH (integer)	The file path to the directory that contains the trusted SSL CA certificates, which are stored in PEM format. This exists as of PHP 5.3.7.
PDO::MYSQL_ATTR_SSL_CERT (integer)	The file path to the SSL certificate. This exists as of PHP 5.3.7.
PDO::MYSQL_ATTR_CIPHER (integer)	A list of one or more permissible ciphers to use for SSL encryption, in a format understood by OpenSSL. For example: DHE-RSA-AES256-SHA:AES128-SHA This exists as of PHP 5.3.7.
PDO::MYSQL_ATTR_KEY (integer)	The file path to the SSL key. This exists as of PHP 5.3.7.

The behaviour of these functions is affected by settings in php.ini.

Table 21.28. PDO_MYSQL Configuration Options

Name	Default	Changeable
pdo_mysql.default_socket	"/tmp/mysql.sock"	PHP_INI_SYSTEM
pdo_mysql.debug	NULL	PHP_INI_SYSTEM

For further details and definitions of the PHP_INI_* modes, see the http://www.php.net/manual/en/configuration.changes.modes.

Here's a short explanation of the configuration directives.

pdo_mysql.default_socket string — Sets a Unix domain socket. This value can either be set at compile time if a domain socket is found at configure. This ini setting is Unix only.

pdo_mysql.debug boolean — Enables debugging for PDO_MYSQL. This setting is only available when PDO_MYSQL is compiled against mysqlnd and in PDO debug mode.

21.10.4.1. PDO_MYSQL DSN

Copyright 1997-2012 the PHP Documentation Group.

- PDO_MYSQL DSN

  Connecting to MySQL databases

Description

The PDO_MYSQL Data Source Name (DSN) is composed of the following elements:

DSN prefix — The DSN prefix is **mysql:**.

host — The hostname on which the database server resides.

port — The port number where the database server is listening.

dbname — The name of the database.

unix_socket — The MySQL Unix socket (shouldn't be used with host or port).

charset — The character set.

Prior to PHP 5.3.6, this element was silently ignored. The same behaviour can be partly replicated with the PDO::MYSQL_ATTR_INIT_COMMAND driver option, as the following example shows.

> **Warning**
>
> The method in the below example can only be used with character sets that share the same lower 7 bit representation as ASCII, such as ISO-8859-1 and UTF-8. Users using character sets that have different representations (such as UTF-16 or Big5) *must* use the charset option provided in PHP 5.3.6 and later versions.

Example 21.205. Setting the connection character set to UTF-8 prior to PHP 5.3.6

```
<?php
$dsn = 'mysql:host=localhost;dbname=testdb';
$username = 'username';
$password = 'password';
$options = array(
    PDO::MYSQL_ATTR_INIT_COMMAND => 'SET NAMES utf8',
);

$dbh = new PDO($dsn, $username, $password, $options);
?>
```

Changelog

Version	Description
5.3.6	Prior to version 5.3.6, `charset` was ignored.

Examples

Example 21.206. PDO_MYSQL DSN examples

The following example shows a PDO_MYSQL DSN for connecting to MySQL databases:

```
mysql:host=localhost;dbname=testdb
```

More complete examples:

```
mysql:host=localhost;port=3307;dbname=testdb
mysql:unix_socket=/tmp/mysql.sock;dbname=testdb
```

Notes

> **Unix only:**
>
> When the host name is set to `"localhost"`, then the connection to the server is made thru a domain socket. If PDO_MYSQL is compiled against libmysql then the location of the socket file is at libmysql's compiled in location. If PDO_MYSQL is compiled against mysqlnd a default socket can be set thru the pdo_mysql.default_socket setting.

21.10.5. Connector/PHP

This documentation, and other publications, sometimes uses the term `Connector/PHP`. This term refers to the full set of MySQL related functionality in PHP, which includes the three APIs that are described above, along with the mysqlnd core library and all of its plugins.

21.10.6. Common Problems with MySQL and PHP

- `Error: Maximum Execution Time Exceeded`: This is a PHP limit; go into the `php.ini` file and set the maximum execution time up from 30 seconds to something higher, as needed. It is also not a bad idea to double the RAM allowed per script to 16MB instead of 8MB.
- `Fatal error: Call to unsupported or undefined function mysql_connect() in ...`: This means that your PHP version isn't compiled with MySQL support. You can either compile a dynamic MySQL module and load it into PHP or recompile PHP with built-in MySQL support. This process is described in detail in the PHP manual.
- `Error: Undefined reference to 'uncompress'`: This means that the client library is compiled with support for a compressed client/server protocol. The fix is to add `-lz` last when linking with `-lmysqlclient`.
- `Error: Client does not support authentication protocol`: This is most often encountered when trying to use the older `mysql` extension with MySQL 4.1.1 and later. Possible solutions are: downgrade to MySQL 4.0; switch to PHP 5 and the newer `mysqli` extension; or configure the MySQL server with `--old-passwords`. (See Section C.5.2.4, “`Client does not support authentication protocol`”, for more information.)

21.10.7. Enabling Both `mysql` and `mysqli` in PHP

If you're experiencing problems with enabling both the `mysql` and the `mysqli` extension when building PHP on Linux yourself, you should try the following procedure.

1. Configure PHP like this:

```
./configure --with-mysqli=/usr/bin/mysql_config --with-mysql=/usr
```

2. Edit the `Makefile` and search for a line that starts with `EXTRA_LIBS`. It might look like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl
-lxml2 -lz -lm -lxml2 -lz -lm -lmysqlclient -lz -lcrypt -lnsl -lm
-lxml2 -lz -lm -lcrypt -lxml2 -lz -lm -lcrypt
```

   Remove all duplicates, so that the line looks like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl
-lxml2
```

3. Build and install PHP:

```
make
make install
```

21.11. MySQL Perl API

The Perl `DBI` module provides a generic interface for database access. You can write a DBI script that works with many different database engines without change. To use DBI with MySQL, install the following:

1. The `DBI` module.
2. The `DBD::mysql` module. This is the DataBase Driver (DBD) module for Perl.
3. Optionally, the DBD module for any other type of database server you want to access.

Perl DBI is the recommended Perl interface. It replaces an older interface called `mysqlperl`, which should be considered obsolete.

These sections contain information about using Perl with MySQL and writing MySQL applications in Perl:

- For installation instructions for Perl DBI support, see Section 2.13, “Perl Installation Notes”.
- For an example of reading options from option files, see Section 5.6.4, “Using Client Programs in a Multiple-Server Environment”.
- For secure coding tips, see Section 5.3.1, “General Security Guidelines”.
- For debugging tips, see Section 22.5.1.4, “Debugging `mysqld` under `gdb`”.
- For some Perl-specific environment variables, see Section 2.12, “Environment Variables”.
- For considerations for running on Mac OS X, see Section 2.4.5, “Using the Bundled MySQL on Mac OS X Server”.
- For ways to quote string literals, see Section 8.1.1, “String Literals”.

DBI information is available at the command line, online, or in printed form:

- Once you have the `DBI` and `DBD::mysql` modules installed, you can get information about them at the command line with the `perldoc` command:

```
shell> perldoc DBI
shell> perldoc DBI::FAQ
shell> perldoc DBD::mysql
```

  You can also use `pod2man`, `pod2html`, and so on to translate this information into other formats.

- For online information about Perl DBI, visit the DBI Web site, http://dbi.perl.org/. That site hosts a general DBI mailing list. Oracle Corporation hosts a list specifically about `DBD::mysql`; see Section 1.6.1, “MySQL Mailing Lists”.

- For printed information, the official DBI book is *Programming the Perl DBI* (Alligator Descartes and Tim Bunce, O'Reilly & Associates, 2000). Information about the book is available at the DBI Web site, http://dbi.perl.org/.

  For information that focuses specifically on using DBI with MySQL, see *MySQL and Perl for the Web* (Paul DuBois, New Riders, 2001). This book's Web site is http://www.kitebird.com/mysql-perl/.

21.12. MySQL Python API

`MySQLdb` provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at http://sourceforge.net/projects/mysql-python/.

Guidelines for Python Developers

The following guidelines cover aspects of developing MySQL applications that might not be immediately obvious to developers coming from a Python background:

- For security, do not hardcode the values needed to connect and log into the database in your main script. Python has the convention of a `config.py` module, where you can keep such values separate from the rest of your code.
- Python scripts often build up and tear down large data structures in memory, up to the limits of available RAM. Because MySQL often deals with data sets that are many times larger than available memory, techniques that optimize storage space and disk I/O are especially important. For example, in MySQL tables, you typically use numeric IDs rather than string-based dictionary keys, so that the key values are compact and have a predictable length. This is especially important for columns that make up the primary key for an `InnoDB` table, because those column values are duplicated within each secondary index.
- Any application that accepts input must expect to handle bad data.

  The bad data might be accidental, such as out-of-range values or misformatted strings. The application can use server-side checks such as unique constraints and NOT NULL constraints, to keep the bad data from ever reaching the database. On the client side, use techniques such as exception handlers to report any problems and take corrective action.

  The bad data might also be deliberate, representing a “SQL injection” attack. For example, input values might contain quotation marks, semicolons, `%` and `_` wildcard characters and other characters significant in SQL statements. Validate input values to make sure they have only the expected characters. Escape any special characters that could change the intended behavior when substituted into a SQL statement. Never concatenate a user input value into a SQL statement without doing validation and escaping first. Even when accepting input generated by some other program, expect that the other program could also be hacked and be sending you incorrect or malicious data.
- Because the result sets from SQL queries can be very large, use the appropriate method to retrieve items from the result set as you loop through them. `fetchone()` retrieves a single item, when you know the result set contains a single row. `fetchall()` retrieves all the items, when you know the result set contains a limited number of rows that can fit comfortably into memory. `fetchmany()` is the general-purpose method when you cannot predict the size of the result set: you keep calling it and looping through the returned items, until there are no more results to process.
- Since Python already has convenient modules such as `pickle` and `cPickle` to read and write data structures on disk, the data that you choose store in MySQL instead is likely to have special characteristics:
  - **Too large to all fit in memory at one time.** You use `SELECT` statements to query only the precise items you need, and aggregate functions to perform calculations across multiple items.
  - **Too complex to be represented by a single data structure.** You divide the data between different SQL tables. You can recombine data from multiple tables by using a join query. You make sure that related data is kept in sync between different tables by setting up foreign key relationships.
  - **Updated frequently, perhaps by multiple users simultaneously.** The updates might only affect a small portion of the data, making it wasteful to write the whole structure each time. You use the SQL `INSERT`, `UPDATE`, and `DELETE` statements to update different items concurrently, writing only the changed values to disk. You use `InnoDB` tables and transactions to keep write operations from conflicting with each other, and to return consistent query results even as the underlying data is being updated.
- Issuing SQL statements from Python typically involves declaring very long, possibly multi-line string literals. Because string literals within the SQL statements could be enclosed by single quotation, double quotation marks, or contain either of those characters, for simplicity you can use Python's triple-quoting mechanism to enclose the entire statement. For example, `'''It doesn't matter if this string contains 'single' or "double" quotes, as long as there aren't 3 in a row.'''`
- Many of the secrets to a fast, scalable MySQL application involve using the right syntax at the very start of your setup proced-

ure, in the `CREATE TABLE` statements. For example, Oracle recommends the `ENGINE=INNODB` clause for most tables, which enables transactional behavior that helps scalability of read-write workloads and offers automatic crash recovery. A follow-on recommendation is to declare a numeric primary key for each table, which offers the fastest way to look up values and can act as a pointer to associated values in other tables (a foreign key). Also within the `CREATE TABLE` statement, using the most compact column data types that meet your application requirements helps performance and scalability, as the database server moves large amounts of data back and forth between memory and disk.

21.13. MySQL Ruby APIs

Two APIs are available for Ruby programmers developing MySQL applications:

- The MySQL/Ruby API is based on the `libmysql` API library. For information on installing and using the MySQL/Ruby API, see Section 21.13.1, “The MySQL/Ruby API”.
- The Ruby/MySQL API is written to use the native MySQL network protocol (a native driver). For information on installing and using the Ruby/MySQL API, see Section 21.13.2, “The Ruby/MySQL API”.

For background and syntax information about the Ruby language, see Ruby Programming Language.

21.13.1. The MySQL/Ruby API

The MySQL/Ruby module provides access to MySQL databases using Ruby through `libmysql`.

For information on installing the module, and the functions exposed, see MySQL/Ruby.

21.13.2. The Ruby/MySQL API

The Ruby/MySQL module provides access to MySQL databases using Ruby through a native driver interface using the MySQL network protocol.

For information on installing the module, and the functions exposed, see Ruby/MySQL.

21.14. MySQL Tcl API

`MySQLtcl` is a simple API for accessing a MySQL database server from the Tcl programming language. It can be found at http://www.xdobry.de/mysqltcl/.

21.15. MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the Eiffel programming language, written by Michael Ravits. It can be found at http://efsa.sourceforge.net/archive/ravits/mysql.htm.

22.1. MySQL Internals

This chapter describes a lot of things that you need to know when working on the MySQL code. To track or contribute to MySQL development, follow the instructions in Section 2.9.3, “Installing MySQL from a Development Source Tree”. If you are interested in MySQL internals, you should also subscribe to our `internals` mailing list. This list has relatively low traffic. For details on how to subscribe, please see Section 1.6.1, “MySQL Mailing Lists”. Many MySQL developers at Oracle Corporation are on the `internals` list and we help other people who are working on the MySQL code. Feel free to use this list both to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

22.1.1. MySQL Threads

The MySQL server creates the following threads:

- Connection manager threads handle client connection requests on the network interfaces that the server listens to. On all platforms, one manager thread handles TCP/IP connection requests. On Unix, this manager thread also handles Unix socket file connection requests. On Windows, a manager thread handles shared-memory connection requests, and another handles named-pipe connection requests. The server does not create threads to handle interfaces that it does not listen to. For example, a Windows server that does not have support for named-pipe connections enabled does not create a thread to handle them.
- Connection manager threads associate each client connection with a thread dedicated to it that handles authentication and request processing for that connection. Manager threads create a new thread when necessary but try to avoid doing so by consulting the thread cache first to see whether it contains a thread that can be used for the connection. When a connection ends, its thread is returned to the thread cache if the cache is not full.

  For information about tuning the parameters that control thread resources, see Section 7.11.5.1, “How MySQL Uses Threads for Client Connections”.
- On a master replication server, connections from slave servers are handled like client connections: There is one thread per connected slave.
- On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.
- A signal thread handles all signals. This thread also normally handles alarms and calls `process_alarm()` to force timeouts on connections that have been idle too long.

- If `InnoDB` is used, there will be additional read and write threads by default. The number of these are controlled by the `innodb_read_io_threads` and `innodb_write_io_threads` parameters. See Section 13.3.4, "`InnoDB` Startup Options and System Variables".
- If `mysqld` is compiled with `-DUSE_ALARM_THREAD`, a dedicated thread that handles alarms is created. This is only used on some systems where there are problems with `sigwait()` or if you want to use the `thr_alarm()` code in your application without a dedicated signal handling thread.
- If the server is started with the `--flush_time=val` option, a dedicated thread is created to flush all tables every *`val`* seconds.
- Each table for which `INSERT DELAYED` statements are issued gets its own thread. See Section 12.2.5.2, "`INSERT DELAYED` Syntax".
- If the event scheduler is active, there is one thread for the scheduler, and a thread for each event currently running. See Section 18.4.1, "Event Scheduler Overview".

`mysqladmin processlist` only shows the connection, `INSERT DELAYED`, replication, and event threads.

22.1.2. The MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform regression tests on the MySQL code. These tests can be run on Unix.

You can also write your own test cases. For information about the MySQL Test Framework, including system requirements, see the manual available at http://dev.mysql.com/doc/.

The current set of test cases doesn't test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code. We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (`mysqltest`), a Perl script to run all tests (`mysql-test-run.pl`), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type `make test` from the source root directory, or change location to the `mysql-test` directory and type `./mysql-test-run.pl`. If you have installed a binary distribution, change location to the `mysql-test` directory under the installation root directory (for example, `/usr/local/mysql/mysql-test`), and run `./mysql-test-run.pl`. All tests should succeed. If any do not, feel free to try to find out why and report the problem if it indicates a bug in MySQL. See Section 1.7, "How to Report Bugs or Problems".

If one test fails, you should run `mysql-test-run.pl` with the `--force` option to check whether any other tests fail.

If you have a copy of `mysqld` running on the machine where you want to run the test suite, you do not have to stop it, as long as it is not using ports `9306` or `9307`. If either of those ports is taken, you should set the `MTR_BUILD_THREAD` environment variable to an appropriate value, and the test suite will use a different set of ports for master, slave, and NDB). For example:

```
shell> export MTR_BUILD_THREAD=31
shell> ./mysql-test-run.pl [options] [test_name]
```

In the `mysql-test` directory, you can run an individual test case with `./mysql-test-run.pl test_name`.

If you have a question about the test suite, or have a test case to contribute, send an email message to the MySQL `internals` mailing list. See Section 1.6.1, "MySQL Mailing Lists". This list does not accept attachments, so you should FTP all the relevant files to: ftp://ftp.mysql.com/pub/mysql/upload/

22.2. The MySQL Plugin API

MySQL supports a plugin API that enables creation of server components. Plugins can be loaded at server startup, or loaded and unloaded at runtime without restarting the server. The API is generic and does not specify what plugins can do. The components supported by this interface include, but are not limited to, storage engines, full-text parser plugins, and server extensions.

For example, full-text parser plugins can be used to replace or augment the built-in full-text parser. A plugin can parse text into words using rules that differ from those used by the built-in parser. This can be useful if you need to parse text with characteristics different from those expected by the built-in parser.

The plugin interface is more general than the older user-defined function (UDF) interface.

The plugin interface uses the `plugin` table in the `mysql` database to record information about plugins that have been installed

permanently with the `INSTALL PLUGIN` statement. This table is created as part of the MySQL installation process. Plugins can also be installed for a single server invocation with the `--plugin-load` option. Plugins installed this way are not recorded in the `plugin` table. See Section 5.1.7.1, “Installing and Uninstalling Plugins”.

MySQL 5.5.7 and up supports an API for client plugins in addition to that for server plugins. This is used, for example, by authentication plugins where a server-side plugin and a client-side plugin cooperate to enable clients to connect to the server through a variety of authentication methods.

Additional Resources

The book *MySQL 5.1 Plugin Development* by Sergei Golubchik and Andrew Hutchings provides a wealth of detail about the plugin API. Despite the fact that the book's title refers to MySQL Server 5.1, most of the information in it applies to later versions as well.

22.2.1. Plugin API Characteristics

The server plugin API has these characteristics:

- All plugins have several things in common.

  Each plugin has a name that it can be referred to in SQL statements, as well as other metadata such as an author and a description that provide other information. This information can be examined in the `INFORMATION_SCHEMA.PLUGINS` table or using the `SHOW PLUGINS` statement.

- The plugin framework is extendable to accommodate different kinds of plugins.

  Although some aspects of the plugin API are common to all types of plugins, the API also permits type-specific interface elements so that different types of plugins can be created. A plugin with one purpose can have an interface most appropriate to its own requirements and not the requirements of some other plugin type.

  Interfaces for several types of plugins exist, such as storage engines, full-text parser, and `INFORMATION_SCHEMA` tables. Others can be added.

- Plugins can expose information to users.

  A plugin can implement system and status variables that are available through the `SHOW VARIABLES` and `SHOW STATUS` statements.

- The plugin API includes versioning information.

  The version information included in the plugin API enables a plugin library and each plugin that it contains to be self-identifying with respect to the API version that was used to build the library. If the API changes over time, the version numbers will change, but a server can examine a given plugin library's version information to determine whether it supports the plugins in the library.

  There are two types of version numbers. The first is the version for the general plugin framework itself. Each plugin library includes this kind of version number. The second type of version applies to individual plugins. Each specific type of plugin has a version for its interface, so each plugin in a library has a type-specific version number. For example, a library containing a full-text parser plugin has a general plugin API version number, and the plugin has a version number specific to the full-text plugin interface.

- The plugin API implements security restrictions.

  A plugin library must be installed in a specific dedicated directory for which the location is controlled by the server and cannot be changed at runtime. Also, the library must contain specific symbols that identify it as a plugin library. The server will not load something as a plugin if it was not built as a plugin.

- Plugins have access to server services.

  The services interface exposes server functionality that plugins can access using ordinary function calls. For details, see Section 22.2.5, “MySQL Services for Plugins”.

In some respects, the server plugin API is similar to the older user-defined function (UDF) API that it supersedes, but the plugin API has several advantages over the older interface. For example, UDFs had no versioning information. Also, the newer plugin interface eliminates the security issues of the older UDF interface. The older interface for writing nonplugin UDFs permitted libraries to be loaded from any directory searched by the system's dynamic linker, and the symbols that identified the UDF library were relatively nonspecific.

The client plugin API has similar architectural characteristics, but client plugins have no direct access to the server the way server plugins do.

22.2.2. Plugin API Components

The server plugin implementation comprises several components.

SQL statements:

- `INSTALL PLUGIN` registers a plugin in the `mysql.plugin` table and loads the plugin code.
- `UNINSTALL PLUGIN` unregisters a plugin from the `mysql.plugin` table and unloads the plugin code.
- The `WITH PARSER` clause for full-text index creation associates a full-text parser plugin with a given `FULLTEXT` index.
- `SHOW PLUGINS` displays information about server plugins.

Command-line options and system variables:

- The `--plugin-load` option enables plugins to be loaded at server startup time.
- The `plugin_dir` system variable indicates the location of the directory where all plugins must be installed. The value of this variable can be specified at server startup with a `--plugin_dir=`*`path`* option. `mysql_config --plugindir` displays the default plugin directory path name.

For additional information about plugin loading, see Section 5.1.7.1, “Installing and Uninstalling Plugins”.

Plugin-related tables:

- The `INFORMATION_SCHEMA.PLUGINS` table contains plugin information.
- The `mysql.plugin` table lists each plugin that was installed with `INSTALL PLUGIN` and is required for plugin use. For new MySQL installations, this table is created during the installation process.

The client plugin implementation is simpler:

- For the `mysql_options()` C API function, the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options enable client programs to load authentication plugins.
- There are C API functions that enable management of client plugins.

To examine how MySQL implements plugins, consult the following source files in a MySQL source distribution:

- In the `include/mysql` directory, `plugin.h` exposes the public plugin API. This file should be examined by anyone who wants to write a plugin library. `plugin_`*`xxx`*`.h` files provide additional information that pertains to specific types of plugins. `client_plugin.h` contains information specific to client plugins.
- In the `sql` directory, `sql_plugin.h` and `sql_plugin.cc` comprise the internal plugin implementation. `sql_acl.cc` is where the server uses authentication plugins. These files need not be consulted by plugin developers. They may be of interest for those who want to know more about how the server handles plugins.
- In the `sql-common` directory, `client_plugin.h` implements the C API client plugin functions, and `client.c` implements client authentication support. These files need not be consulted by plugin developers. They may be of interest for those who want to know more about how the server handles plugins.

22.2.3. Types of Plugins

The plugin API enables creation of plugins that implement several capabilities:

- Storage engines
- Full-text parsers
- Daemons

- `INFORMATION_SCHEMA` tables
- Semisynchronous replication
- Auditing
- Authentication

The following sections provide an overview of these plugin types.

22.2.3.1. Storage Engine Plugins

The pluggable storage engine architecture used by MySQL Server enables storage engines to be written as plugins and loaded into and unloaded from a running server. For a description of this architecture, see Section 13.2, “Overview of MySQL Storage Engine Architecture”.

For information on how to use the plugin API to write storage engines, see MySQL Internals: Custom Engine.

22.2.3.2. Full-Text Parser Plugins

MySQL has a built-in parser that it uses by default for full-text operations (parsing text to be indexed, or parsing a query string to determine the terms to be used for a search). For full-text processing, “parsing” means extracting words from text or a query string based on rules that define which character sequences make up a word and where word boundaries lie.

When parsing for indexing purposes, the parser passes each word to the server, which adds it to a full-text index. When parsing a query string, the parser passes each word to the server, which accumulates the words for use in a search.

The parsing properties of the built-in full-text parser are described in Section 11.9, “Full-Text Search Functions”. These properties include rules for determining how to extract words from text. The parser is influenced by certain system variables such as `ft_min_word_len` and `ft_max_word_len` that cause words shorter or longer to be excluded, and by the stopword list that identifies common words to be ignored.

The plugin API enables you to provide a full-text parser of your own so that you have control over the basic duties of a parser. A parser plugin can operate in either of two roles:

- The plugin can replace the built-in parser. In this role, the plugin reads the input to be parsed, splits it up into words, and passes the words to the server (either for indexing or for word accumulation).

  One reason to use a parser this way is that you need to use different rules from those of the built-in parser for determining how to split up input into words. For example, the built-in parser considers the text “case-sensitive” to consist of two words “case” and “sensitive,” whereas an application might need to treat the text as a single word.

- The plugin can act in conjunction with the built-in parser by serving as a front end for it. In this role, the plugin extracts text from the input and passes the text to the parser, which splits up the text into words using its normal parsing rules. In particular, this parsing will be affected by the `ft_xxx` system variables and the stopword list.

  One reason to use a parser this way is that you need to index content such as PDF documents, XML documents, or `.doc` files. The built-in parser is not intended for those types of input but a plugin can pull out the text from these input sources and pass it to the built-in parser.

It is also possible for a parser plugin to operate in both roles. That is, it could extract text from nonplaintext input (the front end role), and also parse the text into words (thus replacing the built-in parser).

A full-text plugin is associated with full-text indexes on a per-index basis. That is, when you install a parser plugin initially, that does not cause it to be used for any full-text operations. It simply becomes available. For example, a full-text parser plugin becomes available to be named in a `WITH PARSER` clause when creating individual `FULLTEXT` indexes. To create such an index at table-creation time, do this:

```
CREATE TABLE t
(
  doc CHAR(255),
  FULLTEXT INDEX (doc) WITH PARSER my_parser
) ENGINE=MyISAM;
```

Or you can add the index after the table has been created:

```
ALTER TABLE t ADD FULLTEXT INDEX (doc) WITH PARSER my_parser;
```

The only SQL change for associating the parser with the index is the `WITH PARSER` clause. Searches are specified as before, with no changes needed for queries.

When you associate a parser plugin with a `FULLTEXT` index, the plugin is required for using the index. If the parser plugin is dropped, any index associated with it becomes unusable. Any attempt to use it a table for which a plugin is not available results in an error, although `DROP TABLE` is still possible.

For more information about full-text plugins, see Section 22.2.4.4, "Writing Full-Text Parser Plugins".

22.2.3.3. Daemon Plugins

A daemon plugin is a simple type of plugin used for code that should be run by the server but that does not communicate with it. MySQL distributions include an example daemon plugin that writes periodic heartbeat messages to a file.

For more information about daemon plugins, see Section 22.2.4.5, "Writing Daemon Plugins".

22.2.3.4. `INFORMATION_SCHEMA` Plugins

`INFORMATION_SCHEMA` plugins enable the creation of tables containing server metadata that are exposed to users through the `INFORMATION_SCHEMA` database. For example, `InnoDB` uses `INFORMATION_SCHEMA` plugins to provide tables that contain information about current transactions and locks.

For more information about `INFORMATION_SCHEMA` plugins, see Section 22.2.4.6, "Writing `INFORMATION_SCHEMA` Plugins".

22.2.3.5. Semisynchronous Replication Plugins

MySQL replication is asynchronous by default. With semisynchronous replication, a commit performed on the master side blocks before returning to the session that performed the transaction until at least one slave acknowledges that it has received and logged the events for the transaction. Semisynchronous replication is implemented through complementary master and client plugins. See Section 15.3.8, "Semisynchronous Replication".

For more information about semisynchronous replication plugins, see Section 22.2.4.7, "Writing Semisynchronous Replication Plugins".

22.2.3.6. Audit Plugins

As of MySQL 5.5.3, the server provides a pluggable audit interface that enables information about server operations to be reported to interested parties. Currently, audit notification occurs for these operations (although the interface is general and the server could be modified to report others):

- Write a message to the general query log (if the log is enabled)
- Write a message to the error log
- Send a query result to a client

Audit plugins may register with the audit interface to receive notification about server operations. When an auditable event occurs within the server, the server determines whether notification is needed. For each registered audit plugin, the server checks the event against those event classes in which the plugin is interested and passes the event to the plugin if there is a match.

This interface enables audit plugins to receive notifications only about operations in event classes they consider significant and to ignore others. The interface provides for categorization of operations into event classes and further division into event subclasses within each class.

When an audit plugin is notified of an auditable event, it receives a pointer to the current THD structure and a pointer to a structure that contains information about the event. The plugin can examine the event and perform whatever auditing actions are appropriate. For example, the plugin can see what statement produced a result set or was logged, the number of rows in a result, who the current user was for an operation, or the error code for failed operations.

For more information about audit plugins, see Section 22.2.4.8, "Writing Audit Plugins".

22.2.3.7. Authentication Plugins

MySQL 5.5.7 and up supports pluggable authentication. Authentication plugins exist on both the server and client sides. Plugins on the server side implement authentication methods for use by clients when they connect to the server. A plugin on the client side communicates with a server-side plugin to provide the authentication information that it requires. A client-side plugin may interact

with the user, performing tasks such as soliciting a password or other authentication credentials to be sent to the server. See Section 5.5.6, “Pluggable Authentication”.

Pluggable authentication also enables proxy user capability, in which one user takes the identity of another user. A server-side authentication plugin can return to the server the name of the user whose identity the connecting user should have. See Section 5.5.7, “Proxy Users”.

For more information about authentication plugins, see Section 22.2.4.9, “Writing Authentication Plugins”.

22.2.4. Writing Plugins

To create a plugin library, you must provide the required descriptor information that indicates what plugins the library file contains, and write the interface functions for each plugin.

Every server plugin must have a general descriptor that provides information to the plugin API, and a type-specific descriptor that provides information about the plugin interface for a given type of plugin. The structure of the general descriptor is the same for all plugin types. The structure of the type-specific descriptor varies among plugin types and is determined by the requirements of what the plugin needs to do. The server plugin interface also enables plugins to expose status and system variables. These variables become visible through the `SHOW STATUS` and `SHOW VARIABLES` statements and the corresponding `INFORMATION_SCHEMA` tables.

For client-side plugins, the architecture is a bit different. Each plugin must have a descriptor, but there is no division into separate general and type-specific descriptors. Instead, the descriptor begins with a fixed set of members common to all client plugin types, and the common members are followed by any additional members required to implement the specific plugin type.

You can write plugins in C or C++ (or another language that can use C calling conventions). Plugins are loaded and unloaded dynamically, so your operating system must support dynamic loading and you must have compiled the calling application dynamically (not statically). For server plugins, this means that `mysqld` must be compiled dynamically.

A server plugin contains code that becomes part of the running server, so when you write the plugin, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to plugins originally written for older servers. For information about these constraints, see Section 2.9.4, “MySQL Source-Configuration Options”, and Section 2.9.5, “Dealing with Problems Compiling MySQL”.

Client plugin writers should avoid dependencies on what symbols the calling application has because you cannot be sure what applications will use the plugin.

22.2.4.1. Overview of Plugin Writing

The following procedure provides an overview of the steps needed to create a plugin library. The next sections provide additional details on setting plugin data structures and writing specific types of plugins.

1. In the plugin source file, include the header files that the plugin library needs. The `plugin.h` file is required, and the library might require other files as well. For example:

   ```
   #include <stdlib.h>
   #include <ctype.h>
   #include <mysql/plugin.h>
   ```

2. Set up the descriptor information for the plugin library file. For server plugins, write the library descriptor, which must contain the general plugin descriptor for each server plugin in the file. For more information, see Section 22.2.4.2.1, “Server Plugin Library and Plugin Descriptors”. In addition, set up the type-specific descriptor for each server plugin in the library. Each plugin's general descriptor points to its type-specific descriptor.

   For client plugins, write the client descriptor. For more information, see Section 22.2.4.2.3, “Client Plugin Descriptors”.

3. Write the plugin interface functions for each plugin. For example, each plugin's general plugin descriptor points to the initialization and deinitialization functions that the server should invoke when it loads and unloads the plugin. The plugin's type-specific description may also point to interface functions.

4. For server plugins, set up the status and system variables, if there are any.

5. Compile the plugin library as a shared library and install it in the plugin directory. For more information, see Section 22.2.4.3, “Compiling and Installing Plugin Libraries”.

6. For server plugins, register the plugin with the server. For more information, see Section 5.1.7.1, “Installing and Uninstalling Plugins”.

7. Test the plugin to verify that it works properly.

22.2.4.2. Plugin Data Structures

A plugin library file includes descriptor information to indicate what plugins it contains.

If the plugin library contains any server plugins, it must include the following descriptor information:

- A library descriptor indicates the general server plugin API version number used by the library and contains a general plugin descriptor for each server plugin in the library. To provide the framework for this descriptor, invoke two macros from the `plugin.h` header file:

  ```
  mysql_declare_plugin(name)
   ... one or more server plugin descriptors here ...
  mysql_declare_plugin_end;
  ```

  The macros expand to provide a declaration for the API version automatically. You must provide the plugin descriptors.

- Within the library descriptor, each general server plugin is described by a `st_mysql_plugin` structure. This plugin descriptor structure contains information that is common to every type of server plugin: A value that indicates the plugin type; the plugin name, author, description, and license type; pointers to the initialization and deinitialization functions that the server invokes when it loads and unloads the plugin, and pointers to any status or system variables the plugin implements.

- Each general server plugin descriptor within the library descriptor also contains a pointer to a type-specific plugin descriptor. The structure of the type-specific descriptors varies from one plugin type to another because each type of plugin can have its own API. A type-specific plugin descriptor contains a type-specific API version number and pointers to the functions that are needed to implement that plugin type. For example, a full-text parser plugin has initialization and deinitialization functions, and a main parsing function. The server invokes these functions when it uses the plugin to parse text.

The plugin library also contains the interface functions that are referenced by the general and type-specific descriptors for each plugin in the library.

If the plugin library contains a client plugin, it must include a descriptor for the plugin. The descriptor begins with a fixed set of members common to all client plugins, followed by any members specific to the plugin type. To provide the descriptor framework, invoke two macros from the `client_plugin.h` header file:

```
mysql_declare_client_plugin(plugin_type)
   ... members common to all client plugins ...
   ... type-specific extra members ...
mysql_end_client_plugin;
```

The plugin library also contains any interface functions referenced by the client descriptor.

The `mysql_declare_plugin()` and `mysql_declare_client_plugin()` macros differ somewhat in how they can be invoked, which has implications for the contents of plugin libraries. The following guidelines summarize the rules:

- `mysql_declare_plugin()` and `mysql_declare_client_plugin()` can both be used in the same source file, which means that a plugin library can contain both server and client plugins. However, each of `mysql_declare_plugin()` and `mysql_declare_client_plugin()` can be used at most once.

- `mysql_declare_plugin()` permits multiple server plugin declarations, so a plugin library can contain multiple server plugins.

- `mysql_declare_client_plugin()` permits only a single client plugin declaration. To create multiple client plugins, separate plugin libraries must be used.

When a client program looks for a client plugin that is in a plugin library and not built into `libmysql`, it looks for a file with a basename that is the same as the plugin name. For example, if a program needs to use a client authentication plugin named `auth_xxx` on a system that uses `.so` as the library extension, it looks in the file named `auth_xxx.so`. (On Mac OS X, the program looks first for `auth_xxx.dylib`, then for `auth_xxx.so`.) For this reason, if a plugin library contains a client plugin, the library must have the same basename as that plugin.

The same is not true for a library that contains server plugins. The `--plugin-load` option and the `INSTALL PLUGIN` statement provide the library file name explicitly, so there need be no explicit relationship between the library name and the name of any server plugins it contains.

22.2.4.2.1. Server Plugin Library and Plugin Descriptors

Every plugin library that contains server plugins must include a library descriptor that contains the general plugin descriptor for each server plugin in the file. This section discusses how to write the library and general descriptors for server plugins.

The library descriptor must define two symbols:

- `_mysql_plugin_interface_version_` specifies the version number of the general plugin framework. This is given by the `MYSQL_PLUGIN_INTERFACE_VERSION` symbol, which is defined in the `plugin.h` file.
- `_mysql_plugin_declarations_` defines an array of plugin declarations, terminated by a declaration with all members set to 0. Each declaration is an instance of the `st_mysql_plugin` structure (also defined in `plugin.h`). There must be one of these for each server plugin in the library.

If the server does not find those two symbols in a library, it does not accept it as a legal plugin library and rejects it with an error. This prevents use of a library for plugin purposes unless it was built specifically as a plugin library.

The conventional way to define the two required symbols is by using the `mysql_declare_plugin()` and `mysql_declare_plugin_end` macros from the `plugin.h` file:

```
mysql_declare_plugin(name)
 ... one or more server plugin descriptors here ...
mysql_declare_plugin_end;
```

Each server plugin must have a general descriptor that provides information to the server plugin API. The general descriptor has the same structure for all plugin types. The `st_mysql_plugin` structure in the `plugin.h` file defines this descriptor:

```
struct st_mysql_plugin
{
  int type;            /* the plugin type (a MYSQL_XXX_PLUGIN value)   */
  void *info;          /* pointer to type-specific plugin descriptor   */
  const char *name;    /* plugin name                                  */
  const char *author;  /* plugin author (for I_S.PLUGINS)              */
  const char *descr;   /* general descriptive text (for I_S.PLUGINS)   */
  int license;         /* the plugin license (PLUGIN_LICENSE_XXX)      */
  int (*init)(void *);  /* the function to invoke when plugin is loaded */
  int (*deinit)(void *);/* the function to invoke when plugin is unloaded */
  unsigned int version; /* plugin version (for I_S.PLUGINS)             */
  struct st_mysql_show_var *status_vars;
  struct st_mysql_sys_var **system_vars;
  void * __reserved1;   /* reserved for dependency checking            */
  unsigned long flags;  /* flags for plugin */
};
```

The `st_mysql_plugin` descriptor structure members are used as follows. `char *` members should be specified as null-terminated strings.

- `type`: The plugin type. This must be one of the plugin-type values from `plugin.h`:

  ```
  /*
    The allowable types of plugins
  */
  #define MYSQL_UDF_PLUGIN              0  /* User-defined function        */
  #define MYSQL_STORAGE_ENGINE_PLUGIN   1  /* Storage Engine               */
  #define MYSQL_FTPARSER_PLUGIN         2  /* Full-text parser plugin      */
  #define MYSQL_DAEMON_PLUGIN           3  /* The daemon/raw plugin type */
  #define MYSQL_INFORMATION_SCHEMA_PLUGIN  4  /* The I_S plugin type */
  #define MYSQL_AUDIT_PLUGIN            5  /* The Audit plugin type        */
  #define MYSQL_REPLICATION_PLUGIN      6  /* The replication plugin type */
  #define MYSQL_AUTHENTICATION_PLUGIN   7  /* The authentication plugin type */
  ...
  ```

  For example, for a full-text parser plugin, the `type` value is `MYSQL_FTPARSER_PLUGIN`.

- `info`: A pointer to the type-specific descriptor for the plugin. This descriptor's structure depends on the particular type of plugin, unlike that of the general plugin descriptor structure. For version-control purposes, the first member of the type-specific descriptor for every plugin type is expected to be the interface version for the type. This enables the server to check the type-specific version for every plugin no matter its type. Following the version number, the descriptor includes any other members needed, such as callback functions and other information needed by the server to invoke the plugin properly. Later sections on writing particular types of server plugins describe the structure of their type-specific descriptors.
- `name`: A string that gives the plugin name. This is the name that will be listed in the `mysql.plugin` table and by which you refer to the plugin in SQL statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`, or with the `--plugin-load` option. The name is also visible in the `INFORMATION_SCHEMA.PLUGINS` table or the output from `SHOW PLUGINS`.

The plugin name should not begin with the name of any server option. If it does, the server will fail to initialize it. For example, the server has a `--socket` option, so you should not use a plugin name such as `socket`, `socket_plugin`, and so forth.

- `author`: A string naming the plugin author. This can be whatever you like.
- `desc`: A string that provides a general description of the plugin. This can be whatever you like.
- `license`: The plugin license type. The value can be one of `PLUGIN_LICENSE_PROPRIETARY`, `PLUGIN_LICENSE_GPL`, or `PLUGIN_LICENSE_BSD`.
- `init`: A once-only initialization function, or `NULL` if there is no such function. The server executes this function when it loads the plugin, which happens for `INSTALL PLUGIN` or, for plugins listed in the `mysql.plugin` table, at server startup. The function takes one argument that points to the internal structure used to identify the plugin. It returns zero for success and nonzero for failure.
- `deinit`: A once-only deinitialization function, or `NULL` if there is no such function. The server executes this function when it unloads the plugin, which happens for `UNINSTALL PLUGIN` or, for plugins listed in the `mysql.plugin` table, at server shutdown. The function takes one argument that points to the internal structure used to identify the plugin It returns zero for success and nonzero for failure.
- `version`: The plugin version number. When the plugin is installed, this value can be retrieved from the `INFORMATION_SCHEMA.PLUGINS` table. The value includes major and minor numbers. If you write the value as a hex constant, the format is `0x`*`MMNN`*, where *`MM`* and `NN` are the major and minor numbers, respectively. For example, `0x0302` represents version 3.2.
- `status_vars`: A pointer to a structure for status variables associated with the plugin, or `NULL` if there are no such variables. When the plugin is installed, these variables are displayed in the output of the `SHOW STATUS` statement.

  The `status_vars` member, if not `NULL`, points to an array of `st_mysql_show_var` structures that describe status variables. See Section 22.2.4.2.2, “Server Plugin Status and System Variables”.
- `system_vars`: A pointer to a structure for system variables associated with the plugin, or `NULL` if there are no such variables. These options and system variables can be used to help initialize variables within the plugin.

  The `system_vars` member, if not `NULL`, points to an array of `st_mysql_sys_var` structures that describe system variables. See Section 22.2.4.2.2, “Server Plugin Status and System Variables”.
- `__reserved1`: A placeholder for the future. Currently, it should be set to `NULL`.
- `flags`: Plugin flags. Individual bits correspond to different flags. The value should be set to the OR of the applicable flags. These flags are available:

  ```
  #define PLUGIN_OPT_NO_INSTALL   1UL   /* Not dynamically loadable */
  #define PLUGIN_OPT_NO_UNINSTALL 2UL   /* Not dynamically unloadable */
  ```

  `PLUGIN_OPT_NO_INSTALL` indicates that the plugin cannot be loaded at runtime with the `INSTALL PLUGIN` statement. This is appropriate for plugins that must be loaded at server startup with the `--plugin-load` option. `PLUGIN_OPT_NO_UNINSTALL` indicates that the plugin cannot be unloaded at runtime with the `UNINSTALL PLUGIN` statement.

  This member was added in MySQL 5.5.16.

The server invokes the `init` and `deinit` functions in the general plugin descriptor only when loading and unloading the plugin. They have nothing to do with use of the plugin such as happens when an SQL statement causes the plugin to be invoked.

For example, the descriptor information for a library that contains a single full-text parser plugin named `simple_parser` looks like this:

```
mysql_declare_plugin(ftexample)
{
  MYSQL_FTPARSER_PLUGIN,      /* type                            */
  &simple_parser_descriptor,  /* descriptor                      */
  "simple_parser",            /* name                            */
  "Oracle Corporation",       /* author                          */
  "Simple Full-Text Parser",  /* description                     */
  PLUGIN_LICENSE_GPL,         /* plugin license                  */
  simple_parser_plugin_init,  /* init function (when loaded)     */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                         */
  simple_status,              /* status variables                */
  simple_system_variables,    /* system variables                */
  NULL,
  0
```

```
}
mysql_declare_plugin_end;
```

For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

`plugin.h` defines the `mysql_declare_plugin()` and `mysql_declare_plugin_end` macros like this:

```
#ifndef MYSQL_DYNAMIC_PLUGIN
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
MYSQL_PLUGIN_EXPORT int VERSION= MYSQL_PLUGIN_INTERFACE_VERSION; \
MYSQL_PLUGIN_EXPORT int PSIZE= sizeof(struct st_mysql_plugin); \
MYSQL_PLUGIN_EXPORT struct st_mysql_plugin DECLS[]= {
#else
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
MYSQL_PLUGIN_EXPORT int _mysql_plugin_interface_version_= MYSQL_PLUGIN_INTERFACE_VERSION; \
MYSQL_PLUGIN_EXPORT int _mysql_sizeof_struct_st_plugin_= sizeof(struct st_mysql_plugin); \
MYSQL_PLUGIN_EXPORT struct st_mysql_plugin _mysql_plugin_declarations_[]= {
#endif

#define mysql_declare_plugin(NAME) \
__MYSQL_DECLARE_PLUGIN(NAME, \
                builtin_ ## NAME ## _plugin_interface_version, \
                builtin_ ## NAME ## _sizeof_struct_st_plugin, \
                builtin_ ## NAME ## _plugin)

#define mysql_declare_plugin_end ,{0,0,0,0,0,0,0,0,0,0,0,0,0}}
```

> **Note**
>
> Those declarations define the `_mysql_plugin_interface_version_` symbol only if the `MYSQL_DYNAMIC_PLUGIN` symbol is defined. This means that `-DMYSQL_DYNAMIC_PLUGIN` must be provided as part of the compilation command to build the plugin as a shared library.

When the macros are used as just shown, they expand to the following code, which defines both of the required symbols (`_mysql_plugin_interface_version_` and `_mysql_plugin_declarations_`):

```
int _mysql_plugin_interface_version_= MYSQL_PLUGIN_INTERFACE_VERSION;
int _mysql_sizeof_struct_st_plugin_= sizeof(struct st_mysql_plugin);
struct st_mysql_plugin _mysql_plugin_declarations_[]= {
{
  MYSQL_FTPARSER_PLUGIN,      /* type                            */
  &simple_parser_descriptor,  /* descriptor                      */
  "simple_parser",            /* name                            */
  "Oracle Corporation",       /* author                          */
  "Simple Full-Text Parser",  /* description                     */
  PLUGIN_LICENSE_GPL,         /* plugin license                  */
  simple_parser_plugin_init,  /* init function (when loaded)     */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                         */
  simple_status,              /* status variables                */
  simple_system_variables,    /* system variables                */
  NULL,
  0
}
  ,{0,0,0,0,0,0,0,0,0,0,0,0,0}}
};
```

The preceding example declares a single plugin in the general descriptor, but it is possible to declare multiple plugins. List the declarations one after the other between `mysql_declare_plugin()` and `mysql_declare_plugin_end`, separated by commas.

MySQL server plugins can be written in C or C++ (or another language that can use C calling conventions). If you write a C++ plugin, one C++ feature that you should not use is nonconstant variables to initialize global structures. Members of structures such as the `st_mysql_plugin` structure should be initialized only with constant variables. The `simple_parser` descriptor shown earlier is permissible in a C++ plugin because it satisfies that requirement:

```
mysql_declare_plugin(ftexample)
{
  MYSQL_FTPARSER_PLUGIN,      /* type                            */
  &simple_parser_descriptor,  /* descriptor                      */
  "simple_parser",            /* name                            */
  "Oracle Corporation",       /* author                          */
  "Simple Full-Text Parser",  /* description                     */
  PLUGIN_LICENSE_GPL,         /* plugin license                  */
  simple_parser_plugin_init,  /* init function (when loaded)     */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                         */
  simple_status,              /* status variables                */
  simple_system_variables,    /* system variables                */
  NULL,
  0
}
mysql_declare_plugin_end;
```

Here is another valid way to write the general descriptor. It uses constant variables to indicate the plugin name, author, and description:

```
const char *simple_parser_name = "simple_parser";
const char *simple_parser_author = "Oracle Corporation";
const char *simple_parser_description = "Simple Full-Text Parser";

mysql_declare_plugin(ftexample)
{
  MYSQL_FTPARSER_PLUGIN,      /* type                               */
  &simple_parser_descriptor,  /* descriptor                         */
  simple_parser_name,         /* name                               */
  simple_parser_author,       /* author                             */
  simple_parser_description,  /* description                        */
  PLUGIN_LICENSE_GPL,         /* plugin license                     */
  simple_parser_plugin_init,  /* init function (when loaded)     */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                            */
  simple_status,              /* status variables                   */
  simple_system_variables,    /* system variables                   */
  NULL,
  0
}
mysql_declare_plugin_end;
```

However, the following general descriptor is invalid. It uses structure members to indicate the plugin name, author, and description, but structures are not considered constant initializers in C++:

```
typedef struct
{
  const char *name;
  const char *author;
  const char *description;
} plugin_info;

plugin_info parser_info = {
  "simple_parser",
  "Oracle Corporation",
  "Simple Full-Text Parser"
};

mysql_declare_plugin(ftexample)
{
  MYSQL_FTPARSER_PLUGIN,      /* type                               */
  &simple_parser_descriptor,  /* descriptor                         */
  parser_info.name,           /* name                               */
  parser_info.author,         /* author                             */
  parser_info.description,    /* description                        */
  PLUGIN_LICENSE_GPL,         /* plugin license                     */
  simple_parser_plugin_init,  /* init function (when loaded)     */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                            */
  simple_status,              /* status variables                   */
  simple_system_variables,    /* system variables                   */
  NULL,
  0
}
mysql_declare_plugin_end;
```

22.2.4.4.2.2. Server Plugin Status and System Variables

The server plugin interface enables plugins to expose status and system variables using the `status_vars` and `system_vars` members of the general plugin descriptor.

The `status_vars` member of the general plugin descriptor, if not 0, points to an array of `st_mysql_show_var` structures, each of which describes one status variable, followed by a structure with all members set to 0. The `st_mysql_show_var` structure has this definition:

```
struct st_mysql_show_var {
  const char *name;
  char *value;
  enum enum_mysql_show_type type;
};
```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`.

The following table shows the permissible status variable `type` values and what the corresponding variable should be.

Table 22.1. Server Plugin Status Variable Types

Variable Type	Meaning
SHOW_BOOL	Pointer to a boolean variable
SHOW_INT	Pointer to an integer variable
SHOW_LONG	Pointer to a long integer variable
SHOW_LONGLONG	Pointer to a longlong integer variable
SHOW_CHAR	A string
SHOW_CHAR_PTR	Pointer to a string
SHOW_ARRAY	Pointer to another st_mysql_show_var array
SHOW_FUNC	Pointer to a function
SHOW_DOUBLE	Pointer to a double

For the SHOW_FUNC type, the function is called and fills in its out parameter, which then provides information about the variable to be displayed. The function has this signature:

```
#define SHOW_VAR_FUNC_BUFF_SIZE 1024

typedef int (*mysql_show_var_func) (void *thd,
                                    struct st_mysql_show_var *out,
                                    char *buf);
```

The system_vars member, if not 0, points to an array of st_mysql_sys_var structures, each of which describes one system variable (which can also be set from the command-line or configuration file), followed by a structure with all members set to 0. The st_mysql_sys_var structure is defined as follows:

```
struct st_mysql_sys_var {
 int flags;
 const char *name, *comment;
 int (*check)(THD*, struct st_mysql_sys_var *, void*, st_mysql_value*);
 void (*update)(THD*, struct st_mysql_sys_var *, void*, const void*);
};
```

Additional fields are append as required depending upon the flags.

For convenience, a number of macros are defined that make creating new system variables within a plugin much simpler.

Throughout the macros, the following fields are available:

- name: An unquoted identifier for the system variable.
- varname: The identifier for the static variable. Where not available, it is the same as the name field.
- opt: Additional use flags for the system variable. The following table shows the permissible flags.

Table 22.2. Server Plugin System Variable Flags

Flag Value	Description
PLUGIN_VAR_READONLY	The system variable is read only
PLUGIN_VAR_NOSYSVAR	The system variable is not user visible at runtime
PLUGIN_VAR_NOCMDOPT	The system variable is not configurable from the command line
PLUGIN_VAR_NOCMDARG	No argument is required at the command line (typically used for boolean variables)
PLUGIN_VAR_RQCMDARG	An argument is required at the command line (this is the default)
PLUGIN_VAR_OPCMDARG	An argument is optional at the command line
PLUGIN_VAR_MEMALLOC	Used for string variables; indicates that memory is to be allocated for storage of the string

- comment: A descriptive comment to be displayed in the server help message. NULL if this variable is to be hidden.
- check: The check function, NULL for default.
- update: The update function, NULL for default.
- default: The variable default value.

- `minimum`: The variable minimum value.
- `maximum`: The variable maximum value.
- `blocksize`: The variable block size. When the value is set, it is rounded to the nearest multiple of `blocksize`.

A system variable may be accessed either by using the static variable directly or by using the `SYSVAR()`accessor macro. The `SYSVAR()` macro is provided for completeness. Usually it should be used only when the code cannot directly access the underlying variable.

For example:

```
static int my_foo;
static MYSQL_SYSVAR_INT(foo_var, my_foo,
                        PLUGIN_VAR_RQCMDARG, "foo comment",
                        NULL, NULL, 0, 0, INT_MAX, 0);
 ...
   SYSVAR(foo_var)= value;
   value= SYSVAR(foo_var);
   my_foo= value;
   value= my_foo;
```

Session variables may be accessed only through the `THDVAR()` accessor macro. For example:

```
static MYSQL_THDVAR_BOOL(some_flag,
                         PLUGIN_VAR_NOCMDARG, "flag comment",
                         NULL, NULL, FALSE);
 ...
   if (THDVAR(thd, some_flag))
   {
     do_something();
     THDVAR(thd, some_flag)= FALSE;
   }
```

All global and session system variables must be published to `mysqld` before use. This is done by constructing a `NULL`-terminated array of the variables and linking to it in the plugin public interface. For example:

```
static struct st_mysql_sys_var *my_plugin_vars[]= {
  MYSQL_SYSVAR(foo_var),
  MYSQL_SYSVAR(some_flag),
  NULL
};
mysql_declare_plugin(fooplug)
{
  MYSQL_..._PLUGIN,
  &plugin_data,
  "fooplug",
  "foo author",
  "This does foo!",
  PLUGIN_LICENSE_GPL,
  foo_init,
  foo_fini,
  0x0001,
  NULL,
  my_plugin_vars,
  NULL,
  0
}
mysql_declare_plugin_end;
```

The following convenience macros enable you to declare different types of system variables:

- Boolean system variables of type `my_bool`, which is a 1-byte boolean. (0 = FALSE, 1 = TRUE)

  ```
  MYSQL_THDVAR_BOOL(name, opt, comment, check, update, default)
  MYSQL_SYSVAR_BOOL(name, varname, opt, comment, check, update, default)
  ```

- String system variables of type `char*`, which is a pointer to a null-terminated string.

  ```
  MYSQL_THDVAR_STR(name, opt, comment, check, update, default)
  MYSQL_SYSVAR_STR(name, varname, opt, comment, check, update, default)
  ```

- Integer system variables, of which there are several varieties.

  - An `int` system variable, which is typically a 4-byte signed word.

    ```
    MYSQL_THDVAR_INT(name, opt, comment, check, update, default, min, max, blk)
    MYSQL_SYSVAR_INT(name, varname, opt, comment, check, update, default,
    ```

```
                minimum, maximum, blocksize)
```

- An `unsigned int` system variable, which is typically a 4-byte unsigned word.

```
MYSQL_THDVAR_UINT(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_UINT(name, varname, opt, comment, check, update, default,
                  minimum, maximum, blocksize)
```

- A `long` system variable, which is typically either a 4- or 8-byte signed word.

```
MYSQL_THDVAR_LONG(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_LONG(name, varname, opt, comment, check, update, default,
                  minimum, maximum, blocksize)
```

- An `unsigned long` system variable, which is typically either a 4- or 8-byte unsigned word.

```
MYSQL_THDVAR_ULONG(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_ULONG(name, varname, opt, comment, check, update, default,
                   minimum, maximum, blocksize)
```

- A `long long` system variable, which is typically an 8-byte signed word.

```
MYSQL_THDVAR_LONGLONG(name, opt, comment, check, update,
                      default, minimum, maximum, blocksize)
MYSQL_SYSVAR_LONGLONG(name, varname, opt, comment, check, update,
                      default, minimum, maximum, blocksize)
```

- An `unsigned long long` system variable, which is typically an 8-byte unsigned word.

```
MYSQL_THDVAR_ULONGLONG(name, opt, comment, check, update,
                       default, minimum, maximum, blocksize)
MYSQL_SYSVAR_ULONGLONG(name, varname, opt, comment, check, update,
                       default, minimum, maximum, blocksize)
```

- An `unsigned long` system variable, which is typically either a 4- or 8-byte unsigned word. The range of possible values is an ordinal of the number of elements in the `typelib`, starting from 0.

```
MYSQL_THDVAR_ENUM(name, opt, comment, check, update, default, typelib)
MYSQL_SYSVAR_ENUM(name, varname, opt, comment, check, update,
                  default, typelib)
```

- An `unsigned long long` system variable, which is typically an 8-byte unsigned word. Each bit represents an element in the `typelib`.

```
MYSQL_THDVAR_SET(name, opt, comment, check, update, default, typelib)
MYSQL_SYSVAR_SET(name, varname, opt, comment, check, update,
                 default, typelib)
```

Internally, all mutable and plugin system variables are stored in a `HASH` structure.

Display of the server command-line help text is handled by compiling a `DYNAMIC_ARRAY` of all variables relevant to command-line options, sorting them, and then iterating through them to display each option.

When a command-line option has been handled, it is then removed from the `argv` by the `handle_option()` function (`my_getopt.c`); in effect, it is consumed.

The server processes command-line options during the plugin installation process, immediately after the plugin has been successfully loaded but before the plugin initialization function has been called

Plugins loaded at runtime do not benefit from any configuration options and must have usable defaults. Once they are installed, they are loaded at `mysqld` initialization time and configuration options can be set at the command line or within `my.cnf`.

Plugins should consider the `thd` parameter to be read only.

22.2.4.4.2.3. Client Plugin Descriptors

Each client plugin must have a descriptor that provides information to the client plugin API. The descriptor structure begins with a fixed set of members common to all client plugins, followed by any members specific to the plugin type.

The `st_mysql_client_plugin` structure in the `client_plugin.h` file defines a “generic” descriptor that contains the common members:

```
struct st_mysql_client_plugin
{
  int type;
  unsigned int interface_version;
  const char *name;
  const char *author;
  const char *desc;
  unsigned int version[3];
  const char *license;
  void *mysql_api;
  int (*init)(char *, size_t, int, va_list);
  int (*deinit)();
  int (*options)(const char *option, const void *);
};
```

The common `st_mysql_client_plugin` descriptor structure members are used as follows. `char *` members should be specified as null-terminated strings.

- `type`: The plugin type. This must be one of the plugin-type values from `client_plugin.h`, such as `MYSQL_CLIENT_AUTHENTICATION_PLUGIN`.
- `interface_version`: The plugin interface version. For example, this is `MYSQL_CLIENT_AUTHENTICATION_PLUGIN_INTERFACE_VERSION` for an authentication plugin.
- `name`: A string that gives the plugin name. This is the name by which you refer to the plugin when you call `mysql_options()` with the `MYSQL_DEFAULT_AUTH` option or specify the `--default-auth` option to a MySQL client program.
- `author`: A string naming the plugin author. This can be whatever you like.
- `desc`: A string that provides a general description of the plugin. This can be whatever you like.
- `version`: The plugin version as an array of three integers indicating the major, minor, and teeny versions. For example, `{1,2,3}` indicates version 1.2.3.
- `license`: A string that specifies the license type.
- `mysql_api`: For internal use. Specify it as `NULL` in the plugin descriptor.
- `init`: A once-only initialization function, or `NULL` if there is no such function. The client library executes this function when it loads the plugin. The function returns zero for success and nonzero for failure.

  The `init` function uses its first two arguments to return an error message if an error occurs. The first argument is a pointer to a `char` buffer, and the second argument indicates the buffer length. Any message returned by the `init` function must be null-terminated, so the maximum message length is the buffer length minus one. The next arguments are passed to `mysql_load_plugin()`. The first indicates how many more arguments there are (0 if none), followed by any remaining arguments.
- `deinit`: A once-only deinitialization function, or `NULL` if there is no such function. The client library executes this function when it unloads the plugin. The function takes no arguments. It returns zero for success and nonzero for failure.
- `options`: A function for handling options passed to the plugin, or `NULL` if there is no such function. The function takes two arguments representing the option name and a pointer to its value.

For a given client plugin type, the common descriptor members may be followed by additional members necessary to implement plugins of that type. For example, the `st_mysql_client_plugin_AUTHENTICATION` structure for authentication plugins has a function at the end that the client library calls to perform authentication.

To declare a plugin, use the `mysql_declare_client_plugin()` and `mysql_end_client_plugin` macros:

```
mysql_declare_client_plugin(plugin_type)
   ... members common to all client plugins ...
   ... type-specific extra members ...
mysql_end_client_plugin;
```

Do not specify the `type` or `interface_version` member explicitly. The `mysql_declare_client_plugin()` macro uses the *`plugin_type`* argument to generate their values automatically. For example, declare an authentication client plugin like this:

```
mysql_declare_client_plugin(AUTHENTICATION)
```

```
  "my_auth_plugin",
  "Author Name",
  "My Client Authentication Plugin",
  {1,0,0},
  "GPL",
  NULL,
  my_auth_init,
  my_auth_deinit,
  my_auth_options,
  my_auth_main
mysql_end_client_plugin;
```

This declaration uses the `AUTHENTICATION` argument to set the `type` and `interface_version` members to `MYSQL_CLIENT_AUTHENTICATION_PLUGIN` and `MYSQL_CLIENT_AUTHENTICATION_PLUGIN_INTERFACE_VERSION`.

Depending on the plugin type, the descriptor may have other members following the common members. For example, for an authentication plugin, there is a function (`my_auth_main()` in the descriptor just shown) that handles communication with the server. See Section 22.2.4.9, “Writing Authentication Plugins”.

Normally, a client program that supports the use of authentication plugins causes a plugin to be loaded by calling `mysql_options()` to set the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options:

```
char *plugin_dir = "path_to_plugin_dir";
char *default_auth = "plugin_name";

/* ... process command-line options ... */

mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

Typically, the program will also accept `--plugin-dir` and `--default-auth` options that enable users to override the default values.

Should a client program require lower-level plugin management, the client library contains functions that take an `st_mysql_client_plugin` argument. See Section 21.9.10, “C API Client Plugin Functions”.

22.2.4.3. Compiling and Installing Plugin Libraries

After your plugin is written, you must compile it and install it. The procedure for compiling shared objects varies from system to system. If you build your library using `CMake`, it should be able to generate the correct compilation commands for your system. If the library is named `somepluglib`, you should end up with a shared object file that has a name something like `somepluglib.so`. (The file name might have a different extension on your system.)

To use `CMake`, you'll need to set up the configuration files to enable the plugin to be compiled and installed. Use the plugin examples under the `plugin` directory of a MySQL source distribution as a guide.

Create `CMakeLists.txt`, which should look something like this:

```
MYSQL_ADD_PLUGIN(somepluglib somepluglib.c
  MODULE_ONLY MODULE_OUTPUT_NAME "somepluglib")
```

When `CMake` generates the `Makefile`, it should take care of passing to the compilation command the `-DMYSQL_DYNAMIC_PLUGIN` flag, and passing to the linker the `-lmysqlservices` flag, which is needed to link in any functions from services provided through the plugin services interface. See Section 22.2.5, “MySQL Services for Plugins”.

Run `CMake`, then run `make`:

```
shell> cmake .
shell> make
```

If you need to specify configuration options to `CMake`, see Section 2.9.4, “MySQL Source-Configuration Options”, for a list. For example, you might want to specify `CMAKE_INSTALL_PREFIX` to indicate the MySQL base directory under which the plugin should be installed. You can see what value to use for this option with `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'basedir';
+---------------+-----------------+
| Variable_name | Value           |
+---------------+-----------------+
| base          | /usr/local/mysql |
+---------------+-----------------+
```

The location of the plugin directory where you should install the library is given by the `plugin_dir` system variable. For example:

```
mysql> SHOW VARIABLES LIKE 'plugin_dir';
+---------------+---------------------------------+
| Variable_name | Value                           |
+---------------+---------------------------------+
| plugin_dir    | /usr/local/mysql/lib/mysql/plugin |
+---------------+---------------------------------+
```

To install the plugin library, use `make`:

```
shell> make install
```

Verify that `make install` installed the plugin library in the proper directory. After installing it, make sure that the library permissions permit it to be executed by the server.

22.2.4.4. Writing Full-Text Parser Plugins

A full-text parser server plugin can be used to replace or modify the built-in full-text parser. This section describes how to write a full-text parser plugin named `simple_parser`. This plugin performs parsing based on simpler rules than those used by the MySQL built-in full-text parser: Words are nonempty runs of whitespace characters.

The instructions use the source code in the `plugin/fulltext` directory of MySQL source distributions, so change location into that directory. The following procedure describes how the plugin library is created:

1. To write a full-text parser plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed.

   ```
   #include <mysql/plugin.h>
   ```

   `plugin.h` defines the `MYSQL_FTPARSER_PLUGIN` server plugin type and the data structures needed to declare the plugin.

2. Set up the library descriptor for the plugin library file.

   This descriptor contains the general plugin descriptor for the server plugin. For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

   For example, the library descriptor for a library that contains a single full-text parser plugin named `simple_parser` looks like this:

   ```
   mysql_declare_plugin(ftexample)
   {
     MYSQL_FTPARSER_PLUGIN,      /* type                            */
     &simple_parser_descriptor,  /* descriptor                      */
     "simple_parser",            /* name                            */
     "Oracle Corporation",       /* author                          */
     "Simple Full-Text Parser",  /* description                     */
     PLUGIN_LICENSE_GPL,         /* plugin license                  */
     simple_parser_plugin_init,  /* init function (when loaded)     */
     simple_parser_plugin_deinit,/* deinit function (when unloaded) */
     0x0001,                     /* version                         */
     simple_status,              /* status variables                */
     simple_system_variables,    /* system variables                */
     NULL,
     0
   }
   mysql_declare_plugin_end;
   ```

   The `name` member (`simple_parser`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

   For more information, see Section 22.2.4.2.1, “Server Plugin Library and Plugin Descriptors”.

3. Set up the type-specific plugin descriptor.

   Each general plugin descriptor in the library descriptor points to a type-specific descriptor. For a full-text parser plugin, the type-specific descriptor is an instance of the `st_mysql_ftparser` structure in the `plugin.h` file:

   ```
   struct st_mysql_ftparser
   {
     int interface_version;
     int (*parse)(MYSQL_FTPARSER_PARAM *param);
     int (*init)(MYSQL_FTPARSER_PARAM *param);
     int (*deinit)(MYSQL_FTPARSER_PARAM *param);
   };
   ```

As shown by the structure definition, the descriptor has an interface version number and contains pointers to three functions. The version is specified using a symbol of the form `MYSQL_xxx_INTERFACE_VERSION` (such as (`MYSQL_FTPARSER_INTERFACE_VERSION` for full-text parser plugins) The `init` and `deinit` members should point to a function or be set to 0 if the function is not needed. The `parse` member must point to the function that performs the parsing.

In the `simple_parser` declaration, that descriptor is indicated by `&simple_parser_descriptor`. The descriptor specifies the version number for the full-text plugin interface (as given by `MYSQL_FTPARSER_INTERFACE_VERSION`), and the plugin's parsing, initialization, and deinitialization functions:

```
static struct st_mysql_ftparser simple_parser_descriptor=
{
  MYSQL_FTPARSER_INTERFACE_VERSION, /* interface version      */
  simple_parser_parse,              /* parsing function       */
  simple_parser_init,               /* parser init function   */
  simple_parser_deinit              /* parser deinit function */
};
```

A full-text parser plugin is used in two different contexts, indexing and searching. In both contexts, the server calls the initialization and deinitialization functions at the beginning and end of processing each SQL statement that causes the plugin to be invoked. However, during statement processing, the server calls the main parsing function in context-specific fashion:

- For indexing, the server calls the parser for each column value to be indexed.
- For searching, the server calls the parser to parse the search string. The parser might also be called for rows processed by the statement. In natural language mode, there is no need for the server to call the parser. For boolean mode phrase searches or natural language searches with query expansion, the parser is used to parse column values for information that is not in the index. Also, if a boolean mode search is done for a column that has no `FULLTEXT` index, the built-in parser will be called. (Plugins are associated with specific indexes. If there is no index, no plugin is used.)

The plugin declaration in the general plugin descriptor has `init` and `deinit` members that point initialization and deinitialization functions, and so does the type-specific plugin descriptor to which it points. However, these pairs of functions have different purposes and are invoked for different reasons:

- For the plugin declaration in the general plugin descriptor, the initialization and deinitialization functions are invoked when the plugin is loaded and unloaded.
- For the type-specific plugin descriptor, the initialization and deinitialization functions are invoked per SQL statement for which the plugin is used.

Each interface function named in the plugin descriptor should return zero for success or nonzero for failure, and each of them receives an argument that points to a `MYSQL_FTPARSER_PARAM` structure containing the parsing context. The structure has this definition:

```
typedef struct st_mysql_ftparser_param
{
  int (*mysql_parse)(struct st_mysql_ftparser_param *,
                     char *doc, int doc_len);
  int (*mysql_add_word)(struct st_mysql_ftparser_param *,
                        char *word, int word_len,
                        MYSQL_FTPARSER_BOOLEAN_INFO *boolean_info);
  void *ftparser_state;
  void *mysql_ftparam;
  struct charset_info_st *cs;
  char *doc;
  int length;
  int flags;
  enum enum_ftparser_mode mode;
} MYSQL_FTPARSER_PARAM;
```

The structure members are used as follows:

- `mysql_parse`: A pointer to a callback function that invokes the server's built-in parser. Use this callback when the plugin acts as a front end to the built-in parser. That is, when the plugin parsing function is called, it should process the input to extract the text and pass the text to the `mysql_parse` callback.

  The first parameter for this callback function should be the `param` value itself:

  ```
  param->mysql_parse(param, ...);
  ```

  A front end plugin can extract text and pass it all at once to the built-in parser, or it can extract and pass text to the built-in parser a piece at a time. However, in this case, the built-in parser treats the pieces of text as though there are implicit word breaks between them.

- `mysql_add_word`: A pointer to a callback function that adds a word to a full-text index or to the list of search terms. Use this callback when the parser plugin replaces the built-in parser. That is, when the plugin parsing function is called, it should parse the input into words and invoke the `mysql_add_word` callback for each word.

  The first parameter for this callback function should be the `param` value itself:

  ```
  param->mysql_add_word(param, ...);
  ```

- `ftparser_state`: This is a generic pointer. The plugin can set it to point to information to be used internally for its own purposes.
- `mysql_ftparam`: This is set by the server. It is passed as the first argument to the `mysql_parse` or `mysql_add_word` callback.
- `cs`: A pointer to information about the character set of the text, or 0 if no information is available.
- `doc`: A pointer to the text to be parsed.
- `length`: The length of the text to be parsed, in bytes.
- `flags`: Parser flags. This is zero if there are no special flags. Currently, the only nonzero flag is `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.) This member was added in MySQL 5.1.12.

  This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.
- `mode`: The parsing mode. This value will be one of the following constants:
  - `MYSQL_FTPARSER_SIMPLE_MODE`: Parse in fast and simple mode, which is used for indexing and for natural language queries. The parser should pass to the server only those words that should be indexed. If the parser uses length limits or a stopword list to determine which words to ignore, it should not pass such words to the server.
  - `MYSQL_FTPARSER_WITH_STOPWORDS`: Parse in stopword mode. This is used in boolean searches for phrase matching. The parser should pass all words to the server, even stopwords or words that are outside any normal length limits.
  - `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`: Parse in boolean mode. This is used for parsing boolean query strings. The parser should recognize not only words but also boolean-mode operators and pass them to the server as tokens using the `mysql_add_word` callback. To tell the server what kind of token is being passed, the plugin needs to fill in a `MYSQL_FTPARSER_BOOLEAN_INFO` structure and pass a pointer to it.

If the parser is called in boolean mode, the `param->mode` value will be `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`. The `MYSQL_FTPARSER_BOOLEAN_INFO` structure that the parser uses for passing token information to the server looks like this:

```
typedef struct st_mysql_ftparser_boolean_info
{
  enum enum_ft_token_type type;
  int yesno;
  int weight_adjust;
  bool wasign;
  bool trunc;
  /* These are parser state and must be removed. */
  byte prev;
  byte *quot;
} MYSQL_FTPARSER_BOOLEAN_INFO;
```

The parser should fill in the structure members as follows:

- `type`: The token type. The following table shows the permissible types.

Table 22.3. Full-Text Parser Token Types

Token Value	Meaning
`FT_TOKEN_EOF`	End of data
`FT_TOKEN_WORD`	A regular word
`FT_TOKEN_LEFT_PAREN`	The beginning of a group or subexpression
`FT_TOKEN_RIGHT_PAREN`	The end of a group or subexpression

Token Value	Meaning
FT_TOKEN_STOPWORD	A stopword

- yesno: Whether the word must be present for a match to occur. 0 means that the word is optional but increases the match relevance if it is present. Values larger than 0 mean that the word must be present. Values smaller than 0 mean that the word must not be present.
- weight_adjust: A weighting factor that determines how much a match for the word counts. It can be used to increase or decrease the word's importance in relevance calculations. A value of zero indicates no weight adjustment. Values greater than or less than zero mean higher or lower weight, respectively. The examples at Section 11.9.2, "Boolean Full-Text Searches", that use the < and > operators illustrate how weighting works.
- wasign: The sign of the weighting factor. A negative value acts like the ~ boolean-search operator, which causes the word's contribution to the relevance to be negative.
- trunc: Whether matching should be done as if the boolean-mode * truncation operator had been given.

Plugins should not use the prev and quot members of the MYSQL_FTPARSER_BOOLEAN_INFO structure.

4. Set up the plugin interface functions.

   The general plugin descriptor in the library descriptor names the initialization and deinitialization functions that the server should invoke when it loads and unloads the plugin. For simple_parser, these functions do nothing but return zero to indicate that they succeeded:

```
static int simple_parser_plugin_init(void *arg __attribute__((unused)))
{
  return(0);
}

static int simple_parser_plugin_deinit(void *arg __attribute__((unused)))
{
  return(0);
}
```

   Because those functions do not actually do anything, you could omit them and specify 0 for each of them in the plugin declaration.

   The type-specific plugin descriptor for simple_parser names the initialization, deinitialization, and parsing functions that the server invokes when the plugin is used. For simple_parser, the initialization and deinitialization functions do nothing:

```
static int simple_parser_init(MYSQL_FTPARSER_PARAM *param
                              __attribute__((unused)))
{
  return(0);
}

static int simple_parser_deinit(MYSQL_FTPARSER_PARAM *param
                                __attribute__((unused)))
{
  return(0);
}
```

   Here too, because those functions do nothing, you could omit them and specify 0 for each of them in the plugin descriptor.

   The main parsing function, simple_parser_parse(), acts as a replacement for the built-in full-text parser, so it needs to split text into words and pass each word to the server. The parsing function's first argument is a pointer to a structure that contains the parsing context. This structure has a doc member that points to the text to be parsed, and a length member that indicates how long the text is. The simple parsing done by the plugin considers nonempty runs of whitespace characters to be words, so it identifies words like this:

```
static int simple_parser_parse(MYSQL_FTPARSER_PARAM *param)
{
  char *end, *start, *docend= param->doc + param->length;

  for (end= start= param->doc;; end++)
  {
    if (end == docend)
    {
      if (end > start)
        add_word(param, start, end - start);
      break;
    }
    else if (isspace(*end))
    {
      if (end > start)
```

```
        add_word(param, start, end - start);
      start= end + 1;
    }
  }
  return(0);
}
```

As the parser finds each word, it invokes a function `add_word()` to pass the word to the server. `add_word()` is a helper function only; it is not part of the plugin interface. The parser passes the parsing context pointer to `add_word()`, as well as a pointer to the word and a length value:

```
static void add_word(MYSQL_FTPARSER_PARAM *param, char *word, size_t len)
{
  MYSQL_FTPARSER_BOOLEAN_INFO bool_info=
    { FT_TOKEN_WORD, 0, 0, 0, 0, ' ', 0 };

  param->mysql_add_word(param, word, len, &bool_info);
}
```

For boolean-mode parsing, `add_word()` fills in the members of the `bool_info` structure as described earlier in the discussion of the `st_mysql_ftparser_boolean_info` structure.

5. Set up the status variables. For the `simple_parser` plugin, the following status variable array sets up one status variable with a value that is static text, and another with a value that is stored in a long integer variable:

```
long number_of_calls= 0;

struct st_mysql_show_var simple_status[]=
{
  {"static", (char *)"just a static text", SHOW_CHAR},
  {"called", (char *)&number_of_calls,     SHOW_LONG},
  {0,0,0}
};
```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`. For the array just shown, the resulting status variable names are `simple_parser_static` and `simple_parser_called`. This convention means that you can easily display the variables for a plugin using its name:

```
mysql> SHOW STATUS LIKE 'simple_parser%';
+----------------------+--------------------+
| Variable_name        | Value              |
+----------------------+--------------------+
| simple_parser_static | just a static text |
| simple_parser_called | 0                  |
+----------------------+--------------------+
```

6. To compile and install a plugin library object file, use the instructions in Section 22.2.4.3, “Compiling and Installing Plugin Libraries”. To use the library file, it must be installed in the plugin directory (the directory named by the `plugin_dir` system variable). For the `simple_parser` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `mypluglib.so` (the extension might be different depending on your platform).

7. To use the plugin, register it with the server. For example, to register the plugin at runtime, use this statement (change the extension as necessary):

```
mysql> INSTALL PLUGIN simple_parser SONAME 'mypluglib.so';
```

For additional information about plugin loading, see Section 5.1.7.1, “Installing and Uninstalling Plugins”.

8. To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement.

9. Test the plugin to verify that it works properly.

Create a table that contains a string column and associate the parser plugin with a `FULLTEXT` index on the column:

```
mysql> CREATE TABLE t (c VARCHAR(255),
    ->   FULLTEXT (c) WITH PARSER simple_parser
    -> ) ENGINE=MyISAM;
Query OK, 0 rows affected (0.01 sec)
```

Insert some text into the table and try some searches. These should verify that the parser plugin treats all nonwhitespace characters as word characters:

```
mysql> INSERT INTO t VALUES
    ->   ('latin1_general_cs is a case-sensitive collation'),
```

```
    ->   ('I\'d like a case of oranges'),
    ->   ('this is sensitive information'),
    ->   ('another row'),
    ->   ('yet another row');
Query OK, 5 rows affected (0.02 sec)
Records: 5  Duplicates: 0  Warnings: 0

mysql> SELECT c FROM t;
+-------------------------------------------------+
| c                                               |
+-------------------------------------------------+
| latin1_general_cs is a case-sensitive collation |
| I'd like a case of oranges                      |
| this is sensitive information                   |
| another row                                     |
| yet another row                                 |
+-------------------------------------------------+
5 rows in set (0.00 sec)

mysql> SELECT MATCH(c) AGAINST('case') FROM t;
+-------------------------+
| MATCH(c) AGAINST('case') |
+-------------------------+
|                       0 |
|         1.2968142032623 |
|                       0 |
|                       0 |
|                       0 |
+-------------------------+
5 rows in set (0.00 sec)

mysql> SELECT MATCH(c) AGAINST('sensitive') FROM t;
+-----------------------------+
| MATCH(c) AGAINST('sensitive') |
+-----------------------------+
|                           0 |
|                           0 |
|              1.3253291845322 |
|                           0 |
|                           0 |
+-----------------------------+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('case-sensitive') FROM t;
+-----------------------------------+
| MATCH(c) AGAINST('case-sensitive') |
+-----------------------------------+
|                  1.3109166622162 |
|                                0 |
|                                0 |
|                                0 |
|                                0 |
+-----------------------------------+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('I\'d') FROM t;
+-------------------------+
| MATCH(c) AGAINST('I\'d') |
+-------------------------+
|                       0 |
|         1.2968142032623 |
|                       0 |
|                       0 |
|                       0 |
+-------------------------+
5 rows in set (0.01 sec)
```

Note how neither “case” nor “insensitive” match “case-insensitive” the way that they would for the built-in parser.

22.2.4.5. Writing Daemon Plugins

A daemon plugin is a simple type of plugin used for code that should be run by the server but that does not communicate with it. This section describes how to write a daemon server plugin, using the example plugin found in the `plugin/daemon_example` directory of MySQL source distributions. That directory contains the `daemon_example.cc` source file for a daemon plugin named `daemon_example` that writes a heartbeat string at regular intervals to a file named `mysql-heartbeat.log` in the data directory.

To write a daemon plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed.

```
#include <mysql/plugin.h>
```

`plugin.h` defines the `MYSQL_DAEMON_PLUGIN` server plugin type and the data structures needed to declare the plugin.

The `daemon_example.cc` file sets up the library descriptor as follows. The library descriptor includes a single general server plugin descriptor.

```
mysql_declare_plugin(daemon_example)
{
  MYSQL_DAEMON_PLUGIN,
  &daemon_example_plugin,
  "daemon_example",
  "Brian Aker",
  "Daemon example, creates a heartbeat beat file in mysql-heartbeat.log",
  PLUGIN_LICENSE_GPL,
  daemon_example_plugin_init, /* Plugin Init */
  daemon_example_plugin_deinit, /* Plugin Deinit */
  0x0100 /* 1.0 */,
  NULL,                       /* status variables                */
  NULL,                       /* system variables                */
  NULL,                       /* config options                  */
  0,                          /* flags                           */
}
mysql_declare_plugin_end;
```

The `name` member (`daemon_example`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

The second member of the plugin descriptor, `daemon_example_plugin`, points to the type-specific daemon plugin descriptor. This structure consists only of the type-specific API version number:

```
struct st_mysql_daemon daemon_example_plugin=
{ MYSQL_DAEMON_INTERFACE_VERSION  };
```

The type-specific structure has no interface functions. There is no communication between the server and the plugin, except that the server calls the initialization and deinitialization functions from the general plugin descriptor to start and stop the plugin:

- `daemon_example_plugin_init()` opens the heartbeat file and spawns a thread that wakes up periodically and writes the next message to the file.
- `daemon_example_plugin_deinit()` closes the file and performs other cleanup.

To compile and install a plugin library object file, use the instructions in Section 22.2.4.3, “Compiling and Installing Plugin Libraries”. To use the library file, it must be installed in the plugin directory (the directory named by the `plugin_dir` system variable). For the `daemon_example` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `libdaemon_example.so` (the extension might be different depending on your platform).

To use the plugin, register it with the server. For example, to register the plugin at runtime, use this statement (change the extension as necessary):

```
mysql> INSTALL PLUGIN daemon_example SONAME 'libdaemon_example.so';
```

For additional information about plugin loading, see Section 5.1.7.1, “Installing and Uninstalling Plugins”.

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement.

While the plugin is loaded, it writes a heartbeat string at regular intervals to a file named `mysql-heartbeat.log` in the data directory. This file grows without limit, so after you have satistifed yourself that the plugin operates correctly, unload it:

```
mysql> UNINSTALL PLUGIN daemon_example;
```

22.2.4.6. Writing `INFORMATION_SCHEMA` Plugins

This section describes how to write an `INFORMATION_SCHEMA` table server plugin. For example code that implements such plugins, see the `sql/sql_show.cc` file of a MySQL source distribution. You can also look at the example plugins found in the `InnoDB` source. See the `handler/i_s.cc` and `handler/ha_innodb.cc` files within the `InnoDB` source tree (in the `storage/innobase` directory).

To write an `INFORMATION_SCHEMA` table plugin, include the following header files in the plugin source file. Other MySQL or general header files might also be needed.

```
#include <sql_class.h>
#include <table.h>
```

These header files are located in the `sql` directory of MySQL source distributions. They contain C++ structures, so the source file for an `INFORMATION_SCHEMA` plugin must be compiled as C++ (not C) code.

The source file for the example plugin developed here is named `simple_i_s_table.cc`. It creates a simple `INFORMATION_SCHEMA` table named `SIMPLE_I_S_TABLE` that has two columns named `NAME` and `VALUE`. The general descriptor for a plugin library that implements the table looks like this:

```
mysql_declare_plugin(simple_i_s_library)
{
  MYSQL_INFORMATION_SCHEMA_PLUGIN,
  &simple_table_info,               /* type-specific descriptor */
  "SIMPLE_I_S_TABLE",               /* table name */
  "Author Name",                    /* author */
  "Simple INFORMATION_SCHEMA table", /* description */
  PLUGIN_LICENSE_GPL,               /* license type */
  simple_table_init,                /* init function */
  NULL,
  0x0100,                           /* version = 1.0 */
  NULL,                             /* no status variables */
  NULL,                             /* no system variables */
  NULL,                             /* no reserved information */
  0                                 /* no flags */
}
mysql_declare_plugin_end;
```

The `name` member (`SIMPLE_I_S_TABLE`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

The `simple_table_info` member of the general descriptor points to the type-specific descriptor, which consists only of the type-specific API version number:

```
static struct st_mysql_information_schema simple_table_info =
{ MYSQL_INFORMATION_SCHEMA_INTERFACE_VERSION };
```

The general descriptor points to the initialization and deinitialization functions:

- The initialization function provides information about the table structure and a function that populates the table.
- The deinitialization function performs any required cleanup. If no cleanup is needed, this descriptor member can be `NULL` (as in the example shown).

The initialization function should return 0 for success, 1 if an error occurs. The function receives a generic pointer, which it should interpret as a pointer to the table structure:

```
static int table_init(void *ptr)
{
  ST_SCHEMA_TABLE *schema_table= (ST_SCHEMA_TABLE*)ptr;

  schema_table->fields_info= simple_table_fields;
  schema_table->fill_table= simple_fill_table;
  return 0;
}
```

The function should set these two members of the table structure:

- `fields_info`: An array of `ST_FIELD_INFO` structures that contain information about each column.
- `fill_table`: A function that populates the table.

The array pointed to by `fields_info` should contain one element per column of the `INFORMATION_SCHEMA` plus a terminating element. The following `simple_table_fields` array for the example plugin indicates that `SIMPLE_I_S_TABLE` has two columns. `NAME` is string-valued with a length of 10 and `VALUE` is integer-valued with a display width of 20. The last structure marks the end of the array.

```
static ST_FIELD_INFO simple_table_fields[]=
{
  {"NAME", 10, MYSQL_TYPE_STRING, 0, 0 0, 0},
  {"VALUE", 6, MYSQL_TYPE_LONG, 0, MY_I_S_UNSIGNED, 0, 0},
  {0, 0, MYSQL_TYPE_NULL, 0, 0, 0, 0}
};
```

For more information about the column information structure, see the definition of `ST_FIELD_INFO` in the `table.h` header file. The permissible `MYSQL_TYPE_xxx` type values are those used in the C API; see Section 21.9.1, “C API Data Structures”.

The `fill_table` member should be set to a function that populates the table and returns 0 for success, 1 if an error occurs. For

the example plugin, the `simple_fill_table()` function looks like this:

```
static int simple_fill_table(THD *thd, TABLE_LIST *tables, COND *cond)
{
  TABLE *table= tables->table;

  table->field[0]->store("Name 1", 6, system_charset_info);
  table->field[1]->store(1);
  if (schema_table_store_record(thd, table))
    return 1;
  table->field[0]->store("Name 2", 6, system_charset_info);
  table->field[1]->store(2);
  if (schema_table_store_record(thd, table))
    return 1;
  return 0;
}
```

For each row of the `INFORMATION_SCHEMA` table, this function initializes each column, then calls `schema_table_store_record()` to install the row. The `store()` method arguments depend on the type of value to be stored. For column 0 (`NAME`, a string), `store()` takes a pointer to a string, its length, and information about the character set of the string:

```
store(const char *to, uint length, CHARSET_INFO *cs);
```

For column 1 (`VALUE`, an integer), `store()` takes the value and a flag indicating whether it is unsigned:

```
store(longlong nr, bool unsigned_value);
```

For other examples of how to populate `INFORMATION_SCHEMA` tables, search for instances of `schema_table_store_record()` in `sql_show.cc`.

To compile and install a plugin library object file, see the instructions in Section 22.2.4.3, “Compiling and Installing Plugin Libraries”. To use the library file, it must be installed in the plugin directory (the directory named by the `plugin_dir` system variable).

To test the plugin, install it:

```
mysql> INSTALL PLUGIN SIMPLE_I_S_TABLE SONAME 'simple_i_s_table.so';
```

Verify that the table is present:

```
mysql> SELECT TABLE_NAME FROM INFORMATION_SCHEMA.TABLES
    -> WHERE TABLE_NAME = 'SIMPLE_I_S_TABLE';
+------------------+
| TABLE_NAME       |
+------------------+
| SIMPLE_I_S_TABLE |
+------------------+
```

Try to select from it:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.SIMPLE_I_S_TABLE;
+--------+-------+
| NAME   | VALUE |
+--------+-------+
| Name 1 |     1 |
| Name 2 |     2 |
+--------+-------+
```

Uninstall it:

```
mysql> UNINSTALL PLUGIN SIMPLE_I_S_TABLE;
```

22.2.4.7. Writing Semisynchronous Replication Plugins

This section describes how to write semisynchronous replication server plugins, using the example plugins found in the `plugin/semisync` directory of MySQL source distributions. That directory contains the source files for master and slave plugins named `rpl_semi_sync_master` and `rpl_semi_sync_slave`. The information here covers only how to set up the plugin framework. For details about how the plugins implement replication functions, see the source.

To write a semisynchronous replication plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed.

```
#include <mysql/plugin.h>
```

`plugin.h` defines the `MYSQL_REPLICATION_PLUGIN` server plugin type and the data structures needed to declare the plugin.

For the master side, `semisync_master_plugin.cc` contains this general descriptor for a plugin named `rpl_semi_sync_master`:

```
mysql_declare_plugin(semi_sync_master)
{
  MYSQL_REPLICATION_PLUGIN,
  &semi_sync_master_plugin,
  "rpl_semi_sync_master",
  "He Zhenxing",
  "Semi-synchronous replication master",
  PLUGIN_LICENSE_GPL,
  semi_sync_master_plugin_init, /* Plugin Init */
  semi_sync_master_plugin_deinit, /* Plugin Deinit */
  0x0100 /* 1.0 */,
  semi_sync_master_status_vars, /* status variables */
  semi_sync_master_system_vars, /* system variables */
  NULL,                         /* config options */
  0,                            /* flags */
}
mysql_declare_plugin_end;
```

For the slave side, `semisync_slave_plugin.cc` contains this general descriptor for a plugin named `rpl_semi_sync_slave`:

```
mysql_declare_plugin(semi_sync_slave)
{
  MYSQL_REPLICATION_PLUGIN,
  &semi_sync_slave_plugin,
  "rpl_semi_sync_slave",
  "He Zhenxing",
  "Semi-synchronous replication slave",
  PLUGIN_LICENSE_GPL,
  semi_sync_slave_plugin_init, /* Plugin Init */
  semi_sync_slave_plugin_deinit, /* Plugin Deinit */
  0x0100 /* 1.0 */,
  semi_sync_slave_status_vars,  /* status variables */
  semi_sync_slave_system_vars,  /* system variables */
  NULL,                         /* config options */
  0,                            /* flags */
}
mysql_declare_plugin_end;
```

For both the master and slave plugins, the general descriptor has pointers to the type-specific descriptor, the initialization and deinitialization functions, and to the status and system variables implemented by the plugin. For information about variable setup, see Section 22.2.4.2.2, “Server Plugin Status and System Variables”. The following remarks discuss the type-specific descriptor and the initialization and deinitialization functions for the master plugin but apply similarly to the slave plugin.

The `semi_sync_master_plugin` member of the master general descriptor points to the type-specific descriptor, which consists only of the type-specific API version number:

```
struct Mysql_replication semi_sync_master_plugin= {
  MYSQL_REPLICATION_INTERFACE_VERSION
};
```

The initialization and deinitialization function declarations look like this:

```
static int semi_sync_master_plugin_init(void *p);
static int semi_sync_master_plugin_deinit(void *p);
```

The initialization function uses the pointer to register transaction and binary logging “observers” with the server. After successful initialization, the server takes care of invoking the observers at the appropriate times. (For details on the observers, see the source files.) The deinitialization function cleans up by deregistering the observers. Each function returns 0 for success or 1 if an error occurs.

To compile and install a plugin library object file, use the instructions in Section 22.2.4.3, “Compiling and Installing Plugin Libraries”. To use the library files, they must be installed in the plugin directory (the directory named by the `plugin_dir` system variable). For the `rpl_semi_sync_master` and `rpl_semi_sync_slave` plugins, they are compiled and installed when you build MySQL from source. They are also included in binary distributions. The build process produces shared object libraries with names of `semisync_master.so` and `semisync_slave.so` (the extension might be different depending on your platform).

22.2.4.8. Writing Audit Plugins

This section describes how to write an audit server plugin, using the example plugin found in the `plugin/audit_null` directory of MySQL source distributions. The `audit_null.c` source file in that directory implements a simple example audit plugin named `NULL_AUDIT`.

This description is current as of MySQL 5.5.14. For differences in the interface in earlier versions, see Audit Plugin Interface Changes.

Within the server, the pluggable audit interface is implemented in the `sql_audit.h` and `sql_audit.cc` files in the `sql` directory of MySQL source distributions. Additionally, several places in the server are modified to call the audit interface when an auditable event occurs, so that registered audit plugins can be notified about the event if necessary. To see where such calls occur, look for invocations of functions with names of the form `mysql_audit_xxx()`. Audit notification occurs for server operations such as these:

- Writing a message to the general query log (if the log is enabled)
- Writing a message to the error log
- Sending a query result to a client
- Client connect and disconnect events

To write an audit plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed.

```
#include <mysql/plugin_audit.h>
```

`plugin_audit.h` includes `plugin.h`, so you need not include the latter file explicitly. `plugin.h` defines the `MYSQL_AUDIT_PLUGIN` server plugin type and the data structures needed to declare the plugin. `plugin_audit.h` defines data structures specific to audit plugins.

An audit plugin, like any MySQL server plugin, has a general plugin descriptor (see Section 22.2.4.2.1, “Server Plugin Library and Plugin Descriptors”). In `audit_null.c`, the general descriptor looks like this:

```
mysql_declare_plugin(audit_null)
{
  MYSQL_AUDIT_PLUGIN,         /* type                            */
  &audit_null_descriptor,     /* descriptor                      */
  "NULL_AUDIT",               /* name                            */
  "Oracle Corp",              /* author                          */
  "Simple NULL Audit",        /* description                     */
  PLUGIN_LICENSE_GPL,
  audit_null_plugin_init,     /* init function (when loaded)     */
  audit_null_plugin_deinit,   /* deinit function (when unloaded) */
  0x0002,                     /* version                         */
  simple_status,              /* status variables                */
  NULL,                       /* system variables                */
  NULL,
  0,
}
mysql_declare_plugin_end;
```

The `name` member (`NULL_AUDIT`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `INFORMATION_SCHEMA.PLUGINS` or `SHOW PLUGINS`.

The general descriptor also refers to `simple_status`, a structure that exposes several status variables to the `SHOW STATUS` statement:

```
static struct st_mysql_show_var simple_status[]=
{
  { "Audit_null_called", (char *) &number_of_calls, SHOW_INT },
  { "Audit_null_general_log", (char *) &number_of_calls_general_log,
    SHOW_INT },
  { "Audit_null_general_error", (char *) &number_of_calls_general_error,
    SHOW_INT },
  { "Audit_null_general_result", (char *) &number_of_calls_general_result,
    SHOW_INT },
  { 0, 0, 0}
};
```

The `audit_null_plugin_init` initialization function sets the status variables to zero when the plugin is loaded. The `audit_null_plugin_deinit` function performs cleanup with the plugin is unloaded. During operation, the plugin increments the first status variable for each notification it receives. It also increments the others according to the event class and subclass. In effect, the first variable is the aggregate of the counts for the event subclasses.

The `audit_null_descriptor` value in the general descriptor points to the type-specific descriptor. For audit plugins, this descriptor has the following structure:

```
struct st_mysql_audit
{
  int interface_version;
  void (*release_thd)(MYSQL_THD);
  void (*event_notify)(MYSQL_THD, unsigned int, const void *);
  unsigned long class_mask[MYSQL_AUDIT_CLASS_MASK_SIZE];
};
```

The type-specific descriptor has these members:

- `interface_version`: By convention, type-specific plugin descriptors begin with the interface version for the given plugin type. The server checks `interface_version` when it loads the plugin to see whether the plugin is compatible with it. For audit plugins, the value of the `interface_version` member is `MYSQL_AUDIT_INTERFACE_VERSION` (defined in `plugin_audit.h`).
- `release_thd`: A function that the server calls to inform the plugin that it is being dissociated from its thread context. This should be `NULL` if there is no such function.
- `event_notify`: A function that the server calls to notify the plugin that an auditable event has occurred. This function should not be `NULL`; that would not make sense because no auditing would occur.
- `class_mask`: A bit mask that indicates the event classes for which the plugin wants to receive notification. If this value is 0, the server passes no events to the plugin.

The server uses the `event_notify` and `release_thd` functions together. They are called within the context of a specific thread, and a thread might perform an activity that produces several event notifications. The first time the server calls `event_notify` for a thread, it creates a binding of the plugin to the thread. The plugin cannot be uninstalled while this binding exists. When no more events for the thread will occur, the server informs the plugin of this by calling the `release_thd` function, and then destroys the binding. For example, when a client issues a statement, the thread processing the statement might notify audit plugins about the result set produced by the statement and about the statement being logged. After these notifications occur, the server releases the plugin before putting the thread to sleep until the client issues another statement.

This design enables the plugin to allocate resources needed for a given thread in the first call to the `event_notify` function and release them in the `release_thd` function:

```
event_notify function:
  if memory is needed to service the thread
    allocate memory
  ... rest of notification processing ...

release_thd function:
  if memory was allocated
    release memory
  ... rest of release processing ...
```

That is more efficient than allocating and releasing memory repeatedly in the notification function.

For the `NULL_AUDIT` example audit plugin, the type-specific descriptor looks like this:

```
static struct st_mysql_audit audit_null_descriptor=
{
  MYSQL_AUDIT_INTERFACE_VERSION,                  /* interface version    */
  NULL,                                           /* release_thd function */
  audit_null_notify,                              /* notify function      */
  { (unsigned long) MYSQL_AUDIT_GENERAL_CLASSMASK } /* class mask           */
};
```

The server calls `audit_null_notify` to pass audit event information to the plugin. There is no `release_thd` function.

The event class mask indicates an interest in all events of the “general” class. `plugin_audit.h` defines its symbol, `MYSQL_AUDIT_GENERAL_CLASS`, and a mask with a bit for this class:

```
#define MYSQL_AUDIT_GENERAL_CLASS 0
#define MYSQL_AUDIT_GENERAL_CLASSMASK (1 << MYSQL_AUDIT_GENERAL_CLASS)
```

`plugin_audit.h` also has defines for a “connection” event class, although the `NULL_AUDIT` plugin does nothing with such events:

```
#define MYSQL_AUDIT_CONNECTION_CLASS 1
#define MYSQL_AUDIT_CONNECTION_CLASSMASK (1 << MYSQL_AUDIT_CONNECTION_CLASS)
```

A plugin could be written to receive both general and connection events by setting its type-specific descriptor class mask like this:

```
  { (unsigned long) MYSQL_AUDIT_GENERAL_CLASSMASK |
                    MYSQL_AUDIT_CONNECTION_CLASSMASK } /* class mask        */
```

In the type-specific descriptor, the second and third parameters of the `event_notify` function prototype represent the event class and a generic pointer to an event structure:

```
void (*event_notify)(MYSQL_THD, unsigned int, const void *);
```

Events in different classes may have different structures, so the notification function should use the event class value to determine how to interpret the pointer to the event structure.

If the server calls the notification function with an event class of `MYSQL_AUDIT_GENERAL_CLASS`, it passes the event structure as a pointer to a `mysql_event_general` structure:

```
struct mysql_event_general
{
  unsigned int event_subclass;
  int general_error_code;
  unsigned long general_thread_id;
  const char *general_user;
  unsigned int general_user_length;
  const char *general_command;
  unsigned int general_command_length;
  const char *general_query;
  unsigned int general_query_length;
  struct charset_info_st *general_charset;
  unsigned long long general_time;
  unsigned long long general_rows;
};
```

Audit plugins can interpret `mysql_event_general` members as follows:

- `event_subclass`: The event subclass, one of the following values:

  ```
  #define MYSQL_AUDIT_GENERAL_LOG 0
  #define MYSQL_AUDIT_GENERAL_ERROR 1
  #define MYSQL_AUDIT_GENERAL_RESULT 2
  #define MYSQL_AUDIT_GENERAL_STATUS 3
  ```

- `general_error_code`: The error code. This is a value like that returned by the `mysql_errno()` C API function; 0 means “no error.”
- `general_thread_id`: The ID of the thread for which the event occurred.
- `general_user`: The current user for the event.
- `general_user_length`: The length of `general_user`, in bytes.
- `general_command`: For general query log events, the type of operation. Examples: `Connect`, `Query`, `Shutdown`. For error log events, the error message. This is a value like that returned by the `mysql_error()` C API function; an empty string means “no error.” For result events, this is empty.
- `general_command_length`: The length of `general_command`, in bytes.
- `general_query`: The SQL statement that was logged or produced a result.
- `general_query_length`: The length of `general_query`, in bytes.
- `general_charset`: Character set information for the event.
- `general_time`: A `TIMESTAMP` value indicating the time just before the notification function was called.
- `general_rows`: For general query log events, zero. For error log events, the row number at which an error occurred. For result events, the number of rows in the result plus one. For statements that produce no result set, the value is 0. This encoding enables statements that produce no result set to be distinguished from those that produce an empty result set. For example, for a `DELETE` statement, this value is 0. For a `SELECT`, the result is always 1 or more, where 1 represents an empty result set.

The `NULL_AUDIT` plugin notification function is quite simple. It increments a global event counter, verifies that the event is of the “general” class, then looks at the event subclass to determine which subclass counter to increment:

```
static void audit_null_notify(MYSQL_THD thd __attribute__((unused)),
                              unsigned int event_class,
                              const void *event)
{
  number_of_calls++;
  if (event_class == MYSQL_AUDIT_GENERAL_CLASS)
  {
    const struct mysql_event_general *event_general=
      (const struct mysql_event_general *) event;
    switch (event_general->event_subclass)
    {
    case MYSQL_AUDIT_GENERAL_LOG:
      number_of_calls_general_log++;
      break;
    case MYSQL_AUDIT_GENERAL_ERROR:
```

```
      number_of_calls_general_error++;
      break;
    case MYSQL_AUDIT_GENERAL_RESULT:
      number_of_calls_general_result++;
      break;
    default:
      break;
    }
  }
}
```

To compile and install a plugin library object file, use the instructions in Section 22.2.4.3, “Compiling and Installing Plugin Libraries”. To use the library file, it must be installed in the plugin directory (the directory named by the `plugin_dir` system variable). For the `AUDIT_NULL` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `adt_null.so` (the extension might be be different depending on your platform).

To register the plugin at runtime, use this statement (change the extension as necessary):

```
mysql> INSTALL PLUGIN NULL_AUDIT SONAME 'adt_null.so';
```

For additional information about plugin loading, see Section 5.1.7.1, “Installing and Uninstalling Plugins”.

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement.

While the audit plugin is installed, it exposes status variables that indicate the events for which the plugin has been called:

```
mysql> SHOW STATUS LIKE 'Audit_null%';
+---------------------------+-------+
| Variable_name             | Value |
+---------------------------+-------+
| Audit_null_called         | 1385  |
| Audit_null_general_error  | 1     |
| Audit_null_general_log    | 741   |
| Audit_null_general_result | 643   |
+---------------------------+-------+
```

`Audit_null_called` counts all events, and the other variables count instances of event subclasses. For example, the preceding `SHOW STATUS` statement causes the server to send a result to the client and to write a message to the general query log if that log is enabled. Thus, a client that issues the statement repeatedly causes `Audit_null_called` and `Audit_null_general_result` to be incremented each time, and `Audit_null_general_log` to be incremented if the log is enabled.

To disable the plugin after testing it, use this statement to unload it:

```
mysql> UNINSTALL PLUGIN NULL_AUDIT;
```

Audit Plugin Interface Changes

The audit plugin interface has undergone the following changes:

- In MySQL 5.5.5, the `event_subclass` member was added to the `mysql_event_general` structure. Corresponding to this change, the type-specific interface version, `MYSQL_AUDIT_INTERFACE_VERSION`, was increased from `0x0100` to `0x0200` and
- In MySQL 5.5.9, the `MYSQL_AUDIT_CONNECTION_CLASS` event class was added, and the `MYSQL_AUDIT_GENERAL_STATUS` subclass was added to the `MYSQL_AUDIT_GENERAL_CLASS` event class.
- In MySQL 5.5.14, the `event_class` member was removed from the `mysql_event_general` structure and the calling sequence for the notification function was changed. Originally, the second argument was a pointer to the event structure. The function now receives this information as two arguments: an event class number and a pointer to the event. Corresponding to these changes, `MYSQL_AUDIT_INTERFACE_VERSION` was increased to `0x0300`.

Each audit plugin must be compiled against MySQL source in which the value of `MYSQL_AUDIT_INTERFACE_VERSION` is appropriate for the interface version the plugin requires.

22.2.4.9. Writing Authentication Plugins

MySQL supports pluggable authentication, in which plugins are invoked to authenticate client connections. Authentication plugins enable the use of authentication methods other than the built-in method of passwords stored in the `mysql.user` table. For example, plugins can be written to access external authentication methods. Also, authentication plugins can support the proxy user

capability, such that the connecting user is a proxy for another user and is treated, for purposes of access control, as having the privileges of a different user. For more information, see Section 5.5.6, “Pluggable Authentication”, and Section 5.5.7, “Proxy Users”.

An authentication plugin can be written for the server side or the client side. Server-side plugins use the same plugin API that is used for the other server plugin types such as full-text parser or audit plugins (although with a different type-specific descriptor). Client-side plugins use the client plugin API.

Several header files contain information relevant to authentication plugins:

- `plugin.h`: Defines the `MYSQL_AUTHENTICATION_PLUGIN` server plugin type.
- `client_plugin.h`: Defines the API for client plugins. This includes the client plugin descriptor and function prototypes for client plugin C API calls (see Section 21.9.10, “C API Client Plugin Functions”).
- `plugin_auth.h`: Defines the part of the server plugin API specific to authentication plugins. This includes the type-specific descriptor for server-side authentication plugins and the `MYSQL_SERVER_AUTH_INFO` structure.
- `plugin_auth_common.h`: Contains common elements of client and server authentication plugins. This includes return value definitions and the `MYSQL_PLUGIN_VIO` structure.

To write an authentication plugin, include the following header files in the plugin source file. Other MySQL or general header files might also be needed.

- For a source file that implements a server authentication plugin, include this file:

```
#include <mysql/plugin_auth.h>
```

- For a source file that implements a client authentication plugin, or both client and server plugins, include these files:

```
#include <mysql/plugin_auth.h>
#include <mysql/client_plugin.h>
#include <mysql>
```

`plugin_auth.h` includes `plugin.h` and `plugin_auth_common.h`, so you need not include the latter files explicitly.

This section describes how to write a pair of simple server and client authentication plugins that work together.

> **Warning**
>
> These plugins accept any non-empty password and the password is sent in clear text. This is insecure, so the plugins *should not be used in production environments.*

The server-side and client-side plugins developed here both are named `auth_simple`. As described in Section 22.2.4.2, “Plugin Data Structures”, the plugin library file must have the same basename as the client plugin, so the source file name is `auth_simple.c` and produces a library named `auth_simple.so` (assuming that your system uses `.so` as the extension for library files).

In MySQL source distributions, authentication plugin source is located in the `plugin/auth` directory and can be examined as a guide to writing other authentication plugins. Also, to see how the built-in authentication plugins are implemented, see `sql/sql_acl.cc` for plugins that are built in to the MySQL server and `sql-common/client.c` for plugins that are built in to the `libmysql` client library. (For the built-in client plugins, note that the `auth_plugin_t` structures used there differ from the structures used with the usual client plugin declaration macros. In particular, the first two members are provided explicitly, not by declaration macros.)

22.2.4.9.1. Writing the Server-Side Authentication Plugin

Declare the server-side plugin with the usual general descriptor format that is used for all server plugin types (see Section 22.2.4.2.1, “Server Plugin Library and Plugin Descriptors”). For the `auth_simple` plugin, the descriptor looks like this:

```
mysql_declare_plugin(auth_simple)
{
  MYSQL_AUTHENTICATION_PLUGIN,
  &auth_simple_handler,                 /* type-specific descriptor */
  "auth_simple",                        /* plugin name */
  "Author Name",                        /* author */
  "Any-password authentication plugin", /* description */
  PLUGIN_LICENSE_GPL,                   /* license type */
  NULL,                                 /* no init function */
  NULL,                                 /* no deinit function */
  0x0100,                               /* version = 1.0 */
```

```
  NULL,                                 /* no status variables */
  NULL,                                 /* no system variables */
  NULL,                                 /* no reserved information */
  0                                     /* no flags */
}
mysql_declare_plugin_end;
```

The `name` member (`auth_simple`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

The `auth_simple_handler` member of the general descriptor points to the type-specific descriptor. For an authentication plugin, the type-specific descriptor is an instance of the `st_mysql_auth` structure (defined in `plugin_auth.h`):

```
struct st_mysql_auth
{
  int interface_version;
  const char *client_auth_plugin;
  int (*authenticate_user)(MYSQL_PLUGIN_VIO *vio, MYSQL_SERVER_AUTH_INFO *info);
};
```

The `st_mysql_auth` structure has three members: The type-specific API version number, the client plugin name, and a pointer to the main plugin function that communicates with the client. The `client_auth_plugin` member should indicate the name of the client plugin if a specific plugin is required. A value of `NULL` means “any plugin.” In the latter case, whatever plugin the client uses will do. This is useful if the server plugin does not care about the client plugin or what user name or password it sends. For example, this might be true if the server plugin authenticates only local clients and uses some property of the operating system rather than the information sent by the client plugin.

For `auth_simple`, the type-specific descriptor looks like this:

```
static struct st_mysql_auth auth_simple_handler =
{
  MYSQL_AUTHENTICATION_INTERFACE_VERSION,
  "auth_simple",            /* required client-side plugin name */
  auth_simple_server        /* server-side plugin main function */
};
```

The main function takes two arguments representing an I/O structure and a `MYSQL_SERVER_AUTH_INFO` structure. The structure definition is found in `plugin_auth.h`. It looks like this:

```
typedef struct st_mysql_server_auth_info
{
  char *user_name;
  unsigned int user_name_length;
  const char *auth_string;
  unsigned long auth_string_length;
  char authenticated_as[MYSQL_USERNAME_LENGTH+1];
  char external_user[512];
  int  password_used;
  const char *host_or_ip;
  unsigned int host_or_ip_length;
} MYSQL_SERVER_AUTH_INFO;
```

The character set for string members is UTF-8. If there is a `_length` member associated with a string, it indicates the string length in bytes. Strings are also null-terminated.

When an authentication plugin is invoked by the server, it should interpret the `MYSQL_SERVER_AUTH_INFO` structure members as follows. Some of these are used to set the value of SQL functions or system variables within the client session, as indicated.

- `user_name`: The user name sent by the client. The value becomes the `USER()` function value.
- `user_name_length`: The length of `user_name` in bytes.
- `auth_string`: The value of the `authentication_string` column of the `mysql.user` table row for the matching account name (that is, the row that matches the client user name and host name and that the server uses to determine how to authenticate the client).

  Suppose that you create an account using the following statement:

  ```
  CREATE USER 'my_user'@'localhost'
    IDENTIFIED WITH my_plugin AS 'my_auth_string';
  ```

  When `my_user` connects from the local host, the server invokes `my_plugin` and passes `'my_auth_string'` to it as the `auth_string` value.
- `auth_string_length`: The length of `auth_string` in bytes.

- `authenticated_as`: The server sets this to the user name (the value of `user_name`). The plugin can alter it to indicate that the client should have the privileges of a different user. For example, if the plugin supports proxy users, the initial value is the name of the connecting (proxy) user, and the plugin can change this member to the proxied user name. The server then treats the proxy user as having the privileges of the proxied user (assuming that the other conditions for proxy user support are satisfied; see Section 22.2.4.9.4, "Implementing Proxy User Support in Authentication Plugins"). The value is represented as a string at most `MYSQL_USER_NAME_LENGTH` bytes long, plus a terminating null. The value becomes the `CURRENT_USER()` function value.
- `external_user`: The server sets this to the empty string (null terminated). Its value becomes the `external_user` system variable value. If the plugin wants that system variable to have a different value, it should set this member accordingly; for example, to the connecting user name. The value is represented as a string at most 511 bytes long, plus a terminating null.
- `password_used`: This member applies when authentication fails. The plugin can set it or ignore it. The value is used to construct the failure error message of `Authentication fails. Password used: %s`. The value of `password_used` determines how `%s` is handled, as shown in the following table.

`password_used`	`%s` Handling
0	NO
1	YES
2	There will be no `%s`

- `host_or_ip`: The name of the client host if it can be resolved, or the IP address otherwise.
- `host_or_ip_length`: The length of `host_or_ip` in bytes.

The `auth_simple` main function, `auth_simple_server()`, reads the password (a null-terminated string) from the client and succeeds if the password is nonempty (first byte not null):

```
static int auth_simple_server (MYSQL_PLUGIN_VIO *vio,
                               MYSQL_SERVER_AUTH_INFO *info)
{
  unsigned char *pkt;
  int pkt_len;

  /* read the password as null-terminated string, fail on error */
  if ((pkt_len= vio->read_packet(vio, &pkt)) < 0)
    return CR_ERROR;

  /* fail on empty password */
  if (!pkt_len || *pkt == '\0')
  {
    info->password_used= PASSWORD_USED_NO;
    return CR_ERROR;
  }

  /* accept any nonempty password */
  info->password_used= PASSWORD_USED_YES;

  return CR_OK;
}
```

The main function should return `CR_OK` for success, `CR_ERROR` for an error, or `CR_OK_HANDSHAKE_COMPLETE` to tell the server not to send a status packet back to the client. (For an example of how this handshake works, see the `plugin/auth/dialog.c` source file.)

`auth_simple_server_main()` is so basic that it does not use the authentication information structure except to set the member that indicates whether a password was received.

A plugin that supports proxy users must return to the server the name of the proxied user (the MySQL user whose privileges the client user should get). To do this, the plugin must set the `info->authenticated_as` member to the proxied user name. For information about proxying, see Section 5.5.7, "Proxy Users", and Section 22.2.4.9.4, "Implementing Proxy User Support in Authentication Plugins".

22.2.4.9.2. Writing the Client-Side Authentication Plugin

Declare the client-side plugin descriptor with the `mysql_declare_client_plugin()` and `mysql_end_client_plugin` macros (see Section 22.2.4.2.3, "Client Plugin Descriptors"). For the `auth_simple` plugin, the descriptor looks like this:

```
mysql_declare_client_plugin(AUTHENTICATION)
  "auth_simple",                       /* plugin name */
  "Author Name",                       /* author */
  "Any-password authentication plugin", /* description */
```

```
  {1,0,0},                                  /* version = 1.0.0 */
  "GPL",                                    /* license type */
  NULL,                                     /* for internal use */
  NULL,                                     /* no init function */
  NULL,                                     /* no deinit function */
  NULL,                                     /* no option-handling function */
  auth_simple_client                        /* main function */
mysql_end_client_plugin;
```

The descriptor members common to all client plugins are the plugin name through the option-handling function. Following the common members, an authentication plugin also has one extra member. This is the “main” function, which handles communication with the server. The function takes two arguments representing an I/O structure and a connection handler. For our simple any-password plugin, the main function does nothing but write to the server the password provided by the user:

```
static int auth_simple_client (MYSQL_PLUGIN_VIO *vio, MYSQL *mysql)
{
  int res;

  /* send password as null-terminated string in clear text */
  res= vio->write_packet(vio, (const unsigned char *) mysql->passwd,
                         strlen(mysql->passwd) + 1);

  return res ? CR_ERROR : CR_OK;
}
```

The main function should return `CR_OK` for success, `CR_ERROR` for an error, or `CR_OK_HANDSHAKE_COMPLETE` to indicate that the client has done its part successfully and has read the last packet. A plugin may return the latter status if the number of round trips in the authentication protocol is not known in advance and the client plugin must read another packet to determine whether authentication is finished.

22.2.4.9.3. Using the Authentication Plugins

To compile and install a plugin library object file, see the instructions in Section 22.2.4.3, “Compiling and Installing Plugin Libraries”. To use the library file, it must be installed in the plugin directory (the directory named by the `plugin_dir` system variable).

Register the server-side plugin with the server. For example, to load the plugin at server startup, use a `--plugin-load=auth_simple.so` option (change the library extension as necessary for your system).

Create a user for whom the server will use the `auth_simple` plugin for authentication:

```
mysql> CREATE USER 'x'@'localhost'
    -> IDENTIFIED WITH auth_simple;
```

Use a client program to connect to the server as user `x`. The server-side `auth_simple` plugin communicates with the client program that it should use the client-side `auth_simple` plugin, and the latter sends the password to the server. The server plugin should reject connections that send an empty password and accept connections that send a nonempty password. Invoke the client program each way to verify this:

```
shell> mysql --user=x --skip-password
ERROR 1045 (28000): Access denied for user 'x'@'localhost' (using password: NO)

shell> mysql --user=x --password=abc
mysql>
```

Because the server plugin accepts any nonempty password, it should be considered insecure. After testing the plugin to verify that it works, restart the server without the `--plugin-load` option so as not to indavertently leave the server running with an insecure authentication plugin loaded. Also, drop the user with `DROP USER 'x'@'localhost'`.

For additional information about loading and using authentication plugins, see Section 5.1.7.1, “Installing and Uninstalling Plugins”, and Section 5.5.6, “Pluggable Authentication”.

If you are writing a client program that supports the use of authentication plugins, normally such a program causes a plugin to be loaded by calling `mysql_options()` to set the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options:

```
char *plugin_dir = "path_to_plugin_dir";
char *default_auth = "plugin_name";

/* ... process command-line options ... */

mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

Typically, the program will also accept `--plugin-dir` and `--default-auth` options that enable users to override the default values.

Should a client program require lower-level plugin management, the client library contains functions that take an

st_mysql_client_plugin argument. See Section 21.9.10, “C API Client Plugin Functions”.

22.2.4.9.4. Implementing Proxy User Support in Authentication Plugins

One of the capabilities that pluggable authentication makes possible is proxy users (see Section 5.5.7, “Proxy Users”). For a server-side authentication plugin to participate in proxy user support, these conditions must be satisfied:

- When a connecting client should be treated as a proxy user, the plugin must return a different name in the authenticated_as member of the MYSQL_SERVER_AUTH_INFO structure, to indicate the proxied user name. It may also optionally set the external_user member, to set the value of the external_user system variable.
- Proxy user accounts must be set up to be authenticated by the plugin. Use the CREATE USER or GRANT statement to associate accounts with plugins.
- Proxy user accounts must have the PROXY privilege for the proxied accounts. Use the GRANT statement to grant this privilege.

In other words, the only aspect of proxy user support required of the plugin is that it set authenticated_as to the proxied user name. The rest is optional (setting external_user) or done by the DBA using SQL statements.

How does an authentication plugin determine which proxied user to return when the proxy user connects? That depends on the plugin. Typically, the plugin maps clients to proxied users based on the authentication string passed to it by the server. This string comes from the AS part of the IDENTIFIED WITH clause of the CREATE USER statement that specifies use of the plugin for authentication.

The plugin developer determines the syntax rules for the authentication string and implements the plugin according to those rules. Suppose that a plugin takes a comma-separated list of pairs that map external users to MySQL users. For example:

```
CREATE USER ''@'%.example.com'
  IDENTIFIED WITH my_plugin AS 'extuser1=mysqlusera, extuser2=mysqluserb'
CREATE USER ''@'%.example.org'
  IDENTIFIED WITH my_plugin AS 'extuser1=mysqluserc, extuser2=mysqluserd'
```

When the server invokes a plugin to authenticate a client, it passes the appropriate authentication string to the plugin. The plugin is responsible to:

1. Parse the string into its components to determine the mapping to use
2. Compare the client user name to the mapping
3. Return the proper MySQL user name

For example, if extuser2 connects from an example.com host, the server passes 'extuser1=mysqlusera, extuser2=mysqluserb' to the plugin, and the plugin should copy mysqluserb into authenticated_as, with a terminating null byte. If extuser2 connects from an example.org host, the server passes 'extuser1=mysqluserc, extuser2=mysqluserd', and the plugin should copy mysqluserd instead.

If there is no match in the mapping, the action depends on the plugin. If a match is required, the plugin likely will return an error. Or the plugin might simply return the client name; in this case, it should not change authenticated_as, and the server will not treat the client as a proxy.

The following example demonstrates how to handle proxy users using a plugin named auth_simple_proxy. Like the auth_simple plugin described earlier, auth_simple_proxy accepts any nonempty password as valid (and thus should not be used in production environments). In addition, it examines the auth_string authentication string member and uses these very simple rules for interpreting it:

- If the string is empty, the plugin returns the user name as given and no proxying occurs. That is, the plugin leaves the value of authenticated_as unchanged.
- If the string is nonempty, the plugin treats it as the name of the proxied user and copies it to authenticated_as so that proxying occurs.

For testing, set up one account that is not proxied according to the preceding rules, and one that is. This means that one account has no AS clause, and one includes an AS clause that names the proxied user:

```
CREATE USER 'plugin_user1'@'localhost'
  IDENTIFIED WITH auth_simple_proxy;
CREATE USER 'plugin_user2'@'localhost'
  IDENTIFIED WITH auth_simple_proxy AS 'proxied_user';
```

In addition, create an account for the proxied user and grant `plugin_user2` the `PROXY` privilege for it:

```
CREATE USER 'proxied_user'@'localhost'
  IDENTIFIED BY 'proxied_user_pass';
GRANT PROXY
  ON 'proxied_user'@'localhost'
  TO 'plugin_user2'@'localhost';
```

Before the server invokes an authentication plugin, it sets `authenticated_as` to the client user name. To indicate that the user is a proxy, the plugin should set `authenticated_as` to the proxied user name. For `auth_simple_proxy`, this means that it must examine the `auth_string` value, and, if the value is nonempty, copy it to the `authenticated_as` member to return it as the name of the proxied user. In addition, when proxying occurs, the plugin sets the `external_user` member to the client user name; this becomes the value of the `external_user` system variable.

```
static int auth_simple_proxy_server (MYSQL_PLUGIN_VIO *vio,
                                     MYSQL_SERVER_AUTH_INFO *info)
{
  unsigned char *pkt;
  int pkt_len;

  /* read the password as null-terminated string, fail on error */
  if ((pkt_len= vio->read_packet(vio, &pkt)) < 0)
    return CR_ERROR;

  /* fail on empty password */
  if (!pkt_len || *pkt == '\0')
  {
    info->password_used= PASSWORD_USED_NO;
    return CR_ERROR;
  }

  /* accept any nonempty password */
  info->password_used= PASSWORD_USED_YES;

  /* if authentication string is nonempty, use as proxied user name */
  /* and use client name as external_user value */
  if (info->auth_string_length > 0)
  {
    strcpy (info->authenticated_as, info->auth_string);
    strcpy (info->external_user, info->user_name);
  }

  return CR_OK;
}
```

After a successful connection, the `USER()` function should indicate the connecting client user and host name, and `CURRENT_USER()` should indicate the account whose privileges apply during the session. The latter value should be the connecting user account if no proxying occurs or the proxied account if proxying does occur.

Compile and install the plugin, then test it. First, connect as `plugin_user1`:

```
shell> mysql --user=plugin_user1 --password=x
```

In this case, there should be no proxying:

```
mysql> SELECT USER(), CURRENT_USER(), @@proxy_user, @@external_user\G
*************************** 1. row ***************************
         USER(): plugin_user1@localhost
 CURRENT_USER(): plugin_user1@localhost
   @@proxy_user: NULL
@@external_user: NULL
```

Then connect as `plugin_user2`:

```
shell> mysql --user=plugin_user2 --password=x
```

In this case, `plugin_user2` should be proxied to `proxied_user`:

```
mysql> SELECT USER(), CURRENT_USER(), @@proxy_user, @@external_user\G
*************************** 1. row ***************************
         USER(): plugin_user2@localhost
 CURRENT_USER(): proxied_user@localhost
   @@proxy_user: 'plugin_user2'@'localhost'
@@external_user: 'plugin_user2'@'localhost'
```

22.2.5. MySQL Services for Plugins

MySQL server plugins have access to server “services.” The services interface exposes server functionality that plugins can call. It complements the plugin API and has these characteristics:

- Services enable plugins to access code inside the server using ordinary function calls.
- Services are portable and work on multiple platforms.
- The interface includes a versioning mechanism so that service versions supported by the server can be checked at load time against plugin versions. Versioning protects against incompatibilities between the version of a service that the server provides and the version of the service expected or required by a plugin.

Current services include the following, and others can be implemented:

- `my_snprintf`: A string-formatting service that produces consistent results across platforms.
- `my_thd_scheduler`: A service for plugins to select a thread scheduler.
- `thd_alloc`: A memory-allocation service.
- `thd_wait`: A service for plugins to report when they are going to sleep or stall.

The plugin services interface differs from the plugin API as follows:

- The plugin API enables plugins to be used by the server. The calling initiative lies with the server to invoke plugins. This enables plugins to extend server functionality or register to receive notifications about server processing.
- The plugin services interface enables plugins to call code inside the server. The calling initiative lies with plugins to invoke service functions. This enables functionality already implemented in the server to be used by many plugins; they need not individually implement it themselves.

For developers who wish to modify the server to add a new service, see MySQL Services for Plugins in the MySQL Internals Manual.

The remainder of this section describes how a plugin uses server functionality that is available as a service. See also the source for the “daemon” example plugin, which uses the `my_snprintf` service. Within a MySQL source distribution, that plugin is located in the `plugin/daemon_example` directory.

To determine what services exist and what functions they provide, look in the `include/mysql` directory of a MySQL source distribution. The relevant files are:

- `plugin.h` includes `services.h`.
- `services.h` is the “umbrella” header that includes all available service-specific header files.
- Service-specific headers have names like `service_my_snprintf.h` or `service_thd_alloc.h`.

Each service-specific header should contain comments that provide full usage documentation for a given service, including what service functions are available, their calling sequences, and return values.

To use a service or services from within a plugin, the plugin source file must include the `plugin.h` header file to access service-related information:

```
#include <mysql/plugin.h>
```

This does not represent any additional setup cost. A plugin must include that file anyway because it contains definitions and structures that every plugin needs.

To access a service, a plugin calls service functions like any other function. For example, to format a string into a buffer for printing, call the `my_snprintf()` function provided by the service of the same name:

```
char buffer[BUFFER_SIZE];

my_snprintf(buffer, sizeof(buffer), format_string, argument_to_format, ...);
```

When you build your plugin, you must link in the `libmysqlservices` library. Use the `-lmysqlservices` flag at link time. For example, for `CMake`, put this in the top-level `CMakeLists.txt` file:

```
FIND_LIBRARY(MYSQLSERVICES_LIB mysqlservices
```

```
 PATHS "${MYSQL_SRCDIR}/libservices" NO_DEFAULT_PATH)
```

Put this in the `CMakeLists.txt` file in the directory containing the plugin source:

```
# the plugin needs the mysql services library for error logging
TARGET_LINK_LIBRARIES (your_plugin_library_name ${MYSQLSERVICES_LIB})
```

22.3. Adding New Functions to MySQL

There are three ways to add new functions to MySQL:

- You can add functions through the user-defined function (UDF) interface. User-defined functions are compiled as object files and then added to and removed from the server dynamically using the `CREATE FUNCTION` and `DROP FUNCTION` statements. See Section 12.7.3.1, “`CREATE FUNCTION` Syntax for User-Defined Functions”.
- You can add functions as native (built-in) MySQL functions. Native functions are compiled into the `mysqld` server and become available on a permanent basis.
- Another way to add functions is by creating stored functions. These are written using SQL statements rather than by compiling object code. The syntax for writing stored functions is not covered here. See Section 18.2, “Using Stored Routines (Procedures and Functions)”.

Each method of creating compiled functions has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function into the server, you don't need to do that.
- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a binary MySQL distribution. No access to MySQL source is necessary.
- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a newer version for which the UDF interface changes. For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add new functions, they can be invoked in SQL statements just like native functions such as `ABS()` or `SOUNDEX()`.

See Section 8.2.4, “Function Name Parsing and Resolution”, for the rules describing how the server interprets references to different kinds of functions.

The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the `sql/udf_example.c` file that is provided in MySQL source distributions.

22.3.1. Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values and can accept arguments of those same types.
- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.
- Information is provided to functions that enables them to check the number, types, and names of the arguments passed to them.
- You can tell MySQL to coerce arguments to a given type before passing them to a function.
- You can indicate that a function returns `NULL` or that an error occurred.

22.3.2. Adding a New User-Defined Function

For the UDF mechanism to work, functions must be written in C or C++ and your operating system must support dynamic loading.

MySQL source distributions include a file `sql/udf_example.c` that defines 5 new functions. Consult this file to see how UDF calling conventions work. The `include/mysql_com.h` header file defines UDF-related symbols and data structures. (You need not include this header file directly because it is included by `mysql.h`.)

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see Section 2.9.4, "MySQL Source-Configuration Options", and Section 2.9.5, "Dealing with Problems Compiling MySQL".

To be able to use UDFs, you need to link `mysqld` dynamically. If you want to use a UDF that needs to access symbols from `mysqld` (for example, the `metaphone` function in `sql/udf_example.c` that uses `default_charset_info`), you must link the program with `-rdynamic` (see `man dlopen`).

For each function that you want to use in SQL statements, you should define corresponding C (or C++) functions. In the following discussion, the name "xxx" is used for an example function name. To distinguish between SQL and C/C++ usage, `XXX()` (uppercase) indicates an SQL function call, and `xxx()` (lowercase) indicates a C/C++ function call.

> **Note**
>
> When using C++ you can encapsulate your C functions within:
>
> ```
> extern "C" { ... }
> ```
>
> This will ensure that your C++ function names remain readable in the completed UDF.

The C/C++ functions that you write to implement the interface for `XXX()` are:

- `xxx()` (required)

  The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C/C++ function is shown here.

SQL Type	C/C++ Type
`STRING`	`char *`
`INTEGER`	`long long`
`REAL`	`double`

  It is also possible to declare a `DECIMAL` function, but currently the value is returned as a string, so you should write the UDF as though it were a `STRING` function. `ROW` functions are not implemented.

- `xxx_init()` (optional)

  The initialization function for `xxx()`. It can be used for the following purposes:

  - To check the number of arguments to `XXX()`.
  - To check that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the types you want when the main function is called.
  - To allocate any memory required by the main function.
  - To specify the maximum length of the result.
  - To specify (for `REAL` functions) the maximum number of decimal places in the result.
  - To specify whether the result can be `NULL`.

- `xxx_deinit()` (optional)

  The deinitialization function for `xxx()`. It should deallocate any memory allocated by the initialization function.

When an SQL statement invokes `XXX()`, MySQL calls the initialization function `xxx_init()` to let it perform any required setup, such as argument checking or memory allocation. If `xxx_init()` returns an error, MySQL aborts the SQL statement with an error message and does not call the main or deinitialization functions. Otherwise, MySQL calls the main function `xxx()` once for each row. After all rows have been processed, MySQL calls the deinitialization function `xxx_deinit()` so that it can per-

form any required cleanup.

For aggregate functions that work like `SUM()`, you must also provide the following functions:

- `xxx_clear()`

  Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.

- `xxx_add()`

  Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. Call `xxx_init()` to let the aggregate function allocate any memory it needs for storing results.
2. Sort the table according to the `GROUP BY` expression.
3. Call `xxx_clear()` for the first row in each new group.
4. Call `xxx_add()` for each row that belongs in the same group.
5. Call `xxx()` to get the result for the aggregate when the group changes or after the last row has been processed.
6. Repeat steps 3 to 5 until all rows has been processed
7. Call `xxx_deinit()` to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not permitted to allocate any global or static variables that change! If you need memory, you should allocate it in `xxx_init()` and free it in `xxx_deinit()`.

22.3.2.1. UDF Calling Sequences for Simple Functions

This section describes the different functions that you need to define when you create a simple UDF. Section 22.3.2, “Adding a New User-Defined Function”, describes the order in which MySQL calls these functions.

The main `xxx()` function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function `XXX()` to return `STRING`, `INTEGER`, or `REAL` in the `CREATE FUNCTION` statement:

For `STRING` functions:

```
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
          char *result, unsigned long *length,
          char *is_null, char *error);
```

For `INTEGER` functions:

```
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

For `REAL` functions:

```
double xxx(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

`DECIMAL` functions return string values and should be declared the same way as `STRING` functions. `ROW` functions are not implemented.

The initialization and deinitialization functions are declared like this:

```
my_bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);

void xxx_deinit(UDF_INIT *initid);
```

The `initid` parameter is passed to all three functions. It points to a `UDF_INIT` structure that is used to communicate information between functions. The `UDF_INIT` structure members follow. The initialization function should fill in any members that it wishes

to change. (To use the default for a member, leave it unchanged.)

- `my_bool maybe_null`

  `xxx_init()` should set `maybe_null` to `1` if `xxx()` can return `NULL`. The default value is `1` if any of the arguments are declared `maybe_null`.

- `unsigned int decimals`

  The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. For example, if the function is passed `1.34`, `1.345`, and `1.3`, the default would be 3, because `1.345` has 3 decimal digits.

  For arguments that have no fixed number of decimals, the `decimals` value is set to 31, which is 1 more than the maximum number of decimals permitted for the `DECIMAL`, `FLOAT`, and `DOUBLE` data types. As of MySQL 5.5.3, this value is available as the constant `NOT_FIXED_DEC` in the `mysql_com.h` header file.

  A `decimals` value of 31 is used for arguments in cases such as a `FLOAT` or `DOUBLE` column declared without an explicit number of decimals (for example, `FLOAT` rather than `FLOAT(10,3)`) and for floating-point constants such as `1345E-3`. It is also used for string and other nonnumber arguments that might be converted within the function to numeric form.

  The value to which the `decimals` member is initialized is only a default. It can be changed within the function to reflect the actual calculation performed. The default is determined such that the largest number of decimals of the arguments is used. If the number of decimals is `NOT_FIXED_DEC` for even one of the arguments, that is the value used for `decimals`.

- `unsigned int max_length`

  The maximum length of the result. The default `max_length` value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is 21 digits. For real functions, the default is 13 plus the number of decimal digits indicated by `initid->decimals`. (For numeric functions, the length includes any sign or decimal point characters.)

  If you want to return a blob value, you can set `max_length` to 65KB or 16MB. This memory is not allocated, but the value is used to decide which data type to use if there is a need to temporarily store the data.

- `char *ptr`

  A pointer that the function can use for its own purposes. For example, functions can use `initid->ptr` to communicate allocated memory among themselves. `xxx_init()` should allocate the memory and assign it to this pointer:

  ```
  initid->ptr = allocated_memory;
  ```

  In `xxx()` and `xxx_deinit()`, refer to `initid->ptr` to use or deallocate the memory.

- `my_bool const_item`

  `xxx_init()` should set `const_item` to `1` if `xxx()` always returns the same value and to `0` otherwise.

22.3.2.2. UDF Calling Sequences for Aggregate Functions

This section describes the different functions that you need to define when you create an aggregate UDF. Section 22.3.2, “Adding a New User-Defined Function”, describes the order in which MySQL calls these functions.

- `xxx_reset()`

  This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given `UDF_ARGS` argument as the first value in your internal summary value for the group. Declare `xxx_reset()` as follows:

  ```
  void xxx_reset(UDF_INIT *initid, UDF_ARGS *args,
                 char *is_null, char *error);
  ```

  `xxx_reset()` is not needed or used in MySQL 5.5, in which the UDF interface uses `xxx_clear()` instead. However, you can define both `xxx_reset()` and `xxx_clear()` if you want to have your UDF work with older versions of the server. (If you do include both functions, the `xxx_reset()` function in many cases can be implemented internally by calling `xxx_clear()` to reset all variables, and then calling `xxx_add()` to add the `UDF_ARGS` argument as the first value in the group.)

- `xxx_clear()`

  This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare `xxx_clear()` as follows:

  ```
  void xxx_clear(UDF_INIT *initid, char *is_null, char *error);
  ```

  `is_null` is set to point to `CHAR(0)` before calling `xxx_clear()`.

  If something went wrong, you can store a value in the variable to which the `error` argument points. `error` points to a single-byte variable, not to a string buffer.

  `xxx_clear()` is required by MySQL 5.5.

- `xxx_add()`

  This function is called for all rows that belong to the same group. You should use it to add the value in the `UDF_ARGS` argument to your internal summary variable.

  ```
  void xxx_add(UDF_INIT *initid, UDF_ARGS *args,
               char *is_null, char *error);
  ```

The `xxx()` function for an aggregate UDF should be declared the same way as for a nonaggregate UDF. See Section 22.3.2.1, "UDF Calling Sequences for Simple Functions".

For an aggregate UDF, MySQL calls the `xxx()` function after all rows in the group have been processed. You should normally never access its `UDF_ARGS` argument here but instead return a value based on your internal summary variables.

Return value handling in `xxx()` should be done the same way as for a nonaggregate UDF. See Section 22.3.2.4, "UDF Return Values and Error Handling".

The `xxx_reset()` and `xxx_add()` functions handle their `UDF_ARGS` argument the same way as functions for nonaggregate UDFs. See Section 22.3.2.3, "UDF Argument Processing".

The pointer arguments to `is_null` and `error` are the same for all calls to `xxx_reset()`, `xxx_clear()`, `xxx_add()` and `xxx()`. You can use this to remember that you got an error or whether the `xxx()` function should return `NULL`. You should not store a string into `*error`! `error` points to a single-byte variable, not to a string buffer.

`*is_null` is reset for each group (before calling `xxx_clear()`). `*error` is never reset.

If `*is_null` or `*error` are set when `xxx()` returns, MySQL returns `NULL` as the result for the group function.

22.3.2.3. UDF Argument Processing

The `args` parameter points to a `UDF_ARGS` structure that has the members listed here:

- `unsigned int arg_count`

  The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

  ```
  if (args->arg_count != 2)
  {
      strcpy(message,"XXX() requires two arguments");
      return 1;
  }
  ```

  For other `UDF_ARGS` member values that are arrays, array references are zero-based. That is, refer to array members using index values from 0 to `args->arg_count` – 1.

- `enum Item_result *arg_type`

  A pointer to an array containing the types for each argument. The possible type values are `STRING_RESULT`, `INT_RESULT`, `REAL_RESULT`, and `DECIMAL_RESULT`.

  To make sure that arguments are of a given type and return an error if they are not, check the `arg_type` array in the initialization function. For example:

  ```
  if (args->arg_type[0] != STRING_RESULT ||
      args->arg_type[1] != INT_RESULT)
  ```

```
{
    strcpy(message,"XXX() requires a string and an integer");
    return 1;
}
```

Arguments of type `DECIMAL_RESULT` are passed as strings, so you should handle them the same way as `STRING_RESULT` values.

As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the `arg_type` elements to the types you want. This causes MySQL to coerce arguments to those types for each call to `xxx()`. For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in `xxx_init()`:

```
args->arg_type[0] = STRING_RESULT;
args->arg_type[1] = INT_RESULT;
```

Exact-value decimal arguments such as `1.3` or `DECIMAL` column values are passed with a type of `DECIMAL_RESULT`. However, the values are passed as strings. If you want to receive a number, use the initialization function to specify that the argument should be coerced to a `REAL_RESULT` value:

```
args->arg_type[2] = REAL_RESULT;
```

- `char **args`

  `args->args` communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument `i`, `args->args[i]` points to the argument value. (See later for instructions on how to access the value properly.) For a nonconstant argument, `args->args[i]` is `0`. A constant argument is an expression that uses only constants, such as `3` or `4*7-2` or `SIN(3.14)`. A nonconstant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with nonconstant arguments.

  For each invocation of the main function, `args->args` contains the actual arguments that are passed for the row currently being processed.

  If argument `i` represents `NULL`, `args->args[i]` is a null pointer (0). If the argument is not `NULL`, functions can refer to it as follows:

  - An argument of type `STRING_RESULT` is given as a string pointer plus a length, to enable handling of binary data or data of arbitrary length. The string contents are available as `args->args[i]` and the string length is `args->lengths[i]`. Do not assume that the string is null-terminated.
  - For an argument of type `INT_RESULT`, you must cast `args->args[i]` to a `long long` value:

    ```
    long long int_val;
    int_val = *((long long*) args->args[i]);
    ```

  - For an argument of type `REAL_RESULT`, you must cast `args->args[i]` to a `double` value:

    ```
    double    real_val;
    real_val = *((double*) args->args[i]);
    ```

  - For an argument of type `DECIMAL_RESULT`, the value is passed as a string and should be handled like a `STRING_RESULT` value.
  - `ROW_RESULT` arguments are not implemented.

- `unsigned long *lengths`

  For the initialization function, the `lengths` array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, `lengths` contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types `INT_RESULT` or `REAL_RESULT`, `lengths` still contains the maximum length of the argument (as for the initialization function).

- `char *maybe_null`

  For the initialization function, the `maybe_null` array indicates for each argument whether the argument value might be null (0 if no, 1 if yes).

- `char **attributes`

`args->attributes` communicates information about the names of the UDF arguments. For argument `i`, the attribute name is available as a string in `args->attributes[i]` and the attribute length is `args->attribute_lengths[i]`. Do not assume that the string is null-terminated.

By default, the name of a UDF argument is the text of the expression used to specify the argument. For UDFs, an argument may also have an optional `[AS] alias_name` clause, in which case the argument name is `alias_name`. The `attributes` value for each argument thus depends on whether an alias was given.

Suppose that a UDF `my_udf()` is invoked as follows:

```
SELECT my_udf(expr1, expr2 AS alias1, expr3 alias2);
```

In this case, the `attributes` and `attribute_lengths` arrays will have these values:

```
args->attributes[0] = "expr1"
args->attribute_lengths[0] = 5

args->attributes[1] = "alias1"
args->attribute_lengths[1] = 6

args->attributes[2] = "alias2"
args->attribute_lengths[2] = 6
```

- `unsigned long *attribute_lengths`

  The `attribute_lengths` array indicates the length of each argument name.

22.3.2.4. UDF Return Values and Error Handling

The initialization function should return `0` if no error occurred and `1` otherwise. If an error occurs, `xxx_init()` should store a null-terminated error message in the `message` parameter. The message is returned to the client. The message buffer is `MYSQL_ERRMSG_SIZE` characters long, but you should try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function `xxx()` is the function value, for `long long` and `double` functions. A string function should return a pointer to the result and set `*length` to the length (in bytes) of the return value. For example:

```
memcpy(result, "result string", 13);
*length = 13;
```

MySQL passes a buffer to the `xxx()` function using the `result` parameter. This buffer is sufficiently long to hold 255 characters, which can be multi-byte characters. The `xxx()` function can store the result in this buffer if it fits, in which case the return value should be a pointer to the buffer. If the function stores the result in a different buffer, it should return a pointer to that buffer.

If your string function does not use the supplied buffer (for example, if it needs to return a string longer than 255 characters), you must allocate the space for your own buffer with `malloc()` in your `xxx_init()` function or your `xxx()` function and free it in your `xxx_deinit()` function. You can store the allocated memory in the `ptr` slot in the `UDF_INIT` structure for reuse by future `xxx()` calls. See Section 22.3.2.1, “UDF Calling Sequences for Simple Functions”.

To indicate a return value of `NULL` in the main function, set `*is_null` to `1`:

```
*is_null = 1;
```

To indicate an error return in the main function, set `*error` to `1`:

```
*error = 1;
```

If `xxx()` sets `*error` to `1` for any row, the function value is `NULL` for the current row and for any subsequent rows processed by the statement in which `XXX()` was invoked. (`xxx()` is not even called for subsequent rows.)

22.3.2.5. Compiling and Installing User-Defined Functions

Files implementing UDFs must be compiled and installed on the host where the server runs. This process is described below for the example UDF file `sql/udf_example.c` that is included in MySQL source distributions.

If a UDF will be referred to in statements that will be replicated to slave servers, you must ensure that every slave also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

The immediately following instructions are for Unix. Instructions for Windows are given later in this section.

The `udf_example.c` file contains the following functions:

- `metaphon()` returns a metaphon string of the string argument. This is something like a soundex string, but it is more tuned for English.
- `myfunc_double()` returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.
- `myfunc_int()` returns the sum of the length of its arguments.
- `sequence([const int])` returns a sequence starting from the given number or 1 if no number has been given.
- `lookup()` returns the IP address for a host name.
- `reverse_lookup()` returns the host name for an IP address. The function may be called either with a single string argument of the form `'xxx.xxx.xxx.xxx'` or with four numbers.
- `avgcost()` returns an average cost. This is an aggregate function.

A dynamically loadable file should be compiled as a sharable object file, using a command something like this:

```
shell> gcc -shared -o udf_example.so udf_example.c
```

If you are using `gcc` with `CMake` (which is how MySQL is configured), you should be able to create `udf_example.so` with a simpler command:

```
shell> make udf_example
```

After you compile a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from `udf_example.c` using `gcc` directly produces a file named `udf_example.so`. Copy the shared object to the server's plugin directory and name it `udf_example.so`. This directory is given by the value of the `plugin_dir` system variable.

On some systems, the `ldconfig` program that configures the dynamic linker does not recognize a shared object unless its name begins with `lib`. In this case you should rename a file such as `udf_example.so` to `libudf_example.so`.

On Windows, you can compile user-defined functions by using the following procedure:

1. Obtain a MySQL source distribution. See Section 2.1.3, “How to Get MySQL”.
2. Obtain the `CMake` build utility, if necessary, from http://www.cmake.org. (Version 2.6 or later is required).
3. In the source tree, look in the `sql` directory. There are files named `udf_example.def` `udf_example.c` there. Copy both files from this directory to your working directory.
4. Create a `CMake` `makefile` (`CMakeLists.txt`) with these contents:

   ```
   PROJECT(udf_example)

   # Path for MySQL include directory
   INCLUDE_DIRECTORIES("c:/mysql/include")

   ADD_DEFINITIONS("-DHAVE_DLOPEN")
   ADD_LIBRARY(udf_example MODULE udf_example.c udf_example.def)
   TARGET_LINK_LIBRARIES(udf_example wsock32)
   ```

5. Create the VC project and solution files:

   ```
   cmake -G "<Generator>"
   ```

   Invoking `cmake --help` shows you a list of valid Generators.

6. Create `udf_example.dll`:

   ```
   devenv udf_example.sln /build Release
   ```

After the shared object file has been installed, notify `mysqld` about the new functions with the following statements. If object files have a suffix different from `.so` on your system, substitute the correct suffix throughout (for example, `.dll` on Windows).

```
mysql> CREATE FUNCTION metaphon RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION myfunc_double RETURNS REAL SONAME 'udf_example.so';
mysql> CREATE FUNCTION myfunc_int RETURNS INTEGER SONAME 'udf_example.so';
mysql> CREATE FUNCTION sequence RETURNS INTEGER SONAME 'udf_example.so';
mysql> CREATE FUNCTION lookup RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION reverse_lookup
    ->        RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE AGGREGATE FUNCTION avgcost
    ->        RETURNS REAL SONAME 'udf_example.so';
```

To delete functions, use `DROP FUNCTION`:

```
mysql> DROP FUNCTION metaphon;
mysql> DROP FUNCTION myfunc_double;
mysql> DROP FUNCTION myfunc_int;
mysql> DROP FUNCTION sequence;
mysql> DROP FUNCTION lookup;
mysql> DROP FUNCTION reverse_lookup;
mysql> DROP FUNCTION avgcost;
```

The `CREATE FUNCTION` and `DROP FUNCTION` statements update the `func` system table in the `mysql` database. The function's name, type and shared library name are saved in the table. You must have the `INSERT` or `DELETE` privilege for the `mysql` database to create or drop functions, respectively.

You should not use `CREATE FUNCTION` to add a function that has previously been created. If you need to reinstall a function, you should remove it with `DROP FUNCTION` and then reinstall it with `CREATE FUNCTION`. You would need to do this, for example, if you recompile a new version of your function, so that `mysqld` gets the new version. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

22.3.2.6. User-Defined Function Security Precautions

MySQL takes the following measures to prevent misuse of user-defined functions.

You must have the `INSERT` privilege to be able to use `CREATE FUNCTION` and the `DELETE` privilege to be able to use `DROP FUNCTION`. This is necessary because these statements add and delete rows from the `mysql.func` table.

UDFs should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` also supports an `--allow-suspicious-udfs` option that controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off, to prevent attempts at loading functions from shared object files other than those containing legitimate UDFs. If you have older UDFs that contain only the `xxx` symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the `--allow-suspicious-udfs` option. Otherwise, you should avoid enabling this capability.

UDF object files cannot be placed in arbitrary directories. They must be located in the server's plugin directory. This directory is given by the value of the `plugin_dir` system variable.

22.3.3. Adding a New Native Function

To add a new native MySQL function, use the procedure described here, which requires that you use a source distribution. You cannot add native functions to a binary distribution because it is necessary to modify MySQL source code and compile MySQL from the modified source. If you migrate to another version of MySQL (for example, when a new version is released), you must repeat the procedure with the new version.

If the new native function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

To add a new native function, follow these steps to modify source files in the `sql` directory:

1. Create a subclass for the function in `item_create.cc`:

   - If the function takes a fixed number of arguments, create a subclass of `Create_func_arg0`, `Create_func_arg1`, `Create_func_arg2`, or `Create_func_arg3`, respectively, depending on whether the function takes zero, one, two, or three arguments. For examples, see the `Create_func_uuid`, `Create_func_abs`, `Create_func_pow`, and `Create_func_lpad` classes.

- If the function takes a variable number of arguments, create a subclass of `Create_native_func`. For an example, see `Create_func_concat`.

2. To provide a name by which the function can be referred to in SQL statements, register the name in `item_create.cc` by adding a line to this array:

```
static Native_func_registry func_array[]
```

You can register several names for the same function. For example, see the lines for `"LCASE"` and `"LOWER"`, which are aliases for `Create_func_lcase`.

3. In `item_func.h`, declare a class inheriting from `Item_num_func` or `Item_str_func`, depending on whether your function returns a number or a string.

4. In `item_func.cc`, add one of the following declarations, depending on whether you are defining a numeric or string function:

```
double   Item_func_newname::val()
longlong Item_func_newname::val_int()
String  *Item_func_newname::Str(String *str)
```

If you inherit your object from any of the standard items (like `Item_num_func`), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the `Item_str_func` class defines a `val()` function that executes `atof()` on the value returned by `::str()`.

5. If the function is nondeterministic, include the following statement in the item constructor to indicate that function results should not be cached:

```
current_thd->lex->safe_to_cache_query=0;
```

A function is nondeterministic if, given fixed values for its arguments, it can return different results for different invocations.

6. You should probably also define the following object function:

```
void Item_func_newname::fix_length_and_dec()
```

This function should at least calculate `max_length` based on the given arguments. `max_length` is the maximum number of characters the function may return. This function should also set `maybe_null = 0` if the main function can't return a `NULL` value. The function can check whether any of the function arguments can return `NULL` by checking the arguments' `maybe_null` variable. Look at `Item_func_mod::fix_length_and_dec` for a typical example of how to do this.

All functions must be thread-safe. In other words, do not use any global or static variables in the functions without protecting them with mutexes.

If you want to return `NULL` from `::val()`, `::val_int()`, or `::str()`, you should set `null_value` to 1 and return 0.

For `::str()` object functions, there are additional considerations to be aware of:

- The `String *str` argument provides a string buffer that may be used to hold the result. (For more information about the `String` type, take a look at the `sql_string.h` file.)
- The `::str()` function should return the string that holds the result, or `(char*) 0` if the result is `NULL`.
- All current string functions try to avoid allocating any memory unless absolutely necessary!

22.4. Adding New Procedures to MySQL

In MySQL, you can define a procedure in C++ that can access and modify the data in a query before it is sent to the client. The modification can be done on a row-by-row or `GROUP BY` level.

We have created an example procedure to show you what can be done.

22.4.1. PROCEDURE ANALYSE

`ANALYSE([max_elements[,max_memory]])`

`ANALYSE()` is defined in the `sql/sql_analyse.cc` source file, which serves as an example of how to create a procedure for use with the `PROCEDURE` clause of `SELECT` statements. `ANALYSE()` is built in and is available by default; other procedures can be created using the format demonstrated in the source file.

`ANALYSE()` examines the result from a query and returns an analysis of the results that suggests optimal data types for each column that may help reduce table sizes. To obtain this analysis, append `PROCEDURE ANALYSE` to the end of a `SELECT` statement:

```
SELECT ... FROM ... WHERE ... PROCEDURE ANALYSE([max_elements,[max_memory]])
```

For example:

```
SELECT col1, col2 FROM table1 PROCEDURE ANALYSE(10, 2000);
```

The results show some statistics for the values returned by the query, and propose an optimal data type for the columns. This can be helpful for checking your existing tables, or after importing new data. You may need to try different settings for the arguments so that `PROCEDURE ANALYSE()` does not suggest the `ENUM` data type when it is not appropriate.

The arguments are optional and are used as follows:

- *`max_elements`* (default 256) is the maximum number of distinct values that `ANALYSE()` notices per column. This is used by `ANALYSE()` to check whether the optimal data type should be of type `ENUM`; if there are more than *`max_elements`* distinct values, then `ENUM` is not a suggested type.
- *`max_memory`* (default 8192) is the maximum amount of memory that `ANALYSE()` should allocate per column while trying to find all distinct values.

22.4.2. Writing a Procedure

You can find information about procedures by examining the following source files:

- `sql/sql_analyse.cc`
- `sql/procedure.h`
- `sql/procedure.cc`
- `sql/sql_select.cc`

See also Writing a Procedure at MySQL Forge.

22.5. Debugging and Porting MySQL

This appendix helps you port MySQL to other operating systems. Do check the list of currently supported operating systems first. See Section 2.1.1, “Operating Systems Supported by MySQL Community Server”. If you have created a new port of MySQL, please let us know so that we can list it here and on our Web site (http://www.mysql.com/), recommending it to other users.

> **Note**
>
> If you create a new port of MySQL, you are free to copy and distribute it under the GPL license, but it does not make you a copyright holder of MySQL.

A working POSIX thread library is needed for the server.

To build MySQL from source, your system must satisfy the tool requirements listed at Section 2.9, “Installing MySQL from Source”.

> **Important**
>
> If you are trying to build MySQL 5.5 with `icc` on the IA64 platform, and need support for MySQL Cluster, you should first ensure that you are using `icc` version 9.1.043 or later. (For details, see Bug #21875.)

If you run into problems with a new port, you may have to do some debugging of MySQL! See Section 22.5.1, “Debugging a MySQL Server”.

> **Note**
>
> Before you start debugging `mysqld`, first get the test programs `mysys/thr_alarm` and `mysys/thr_lock` to work. This ensures that your thread installation has even a remote chance to work!

22.5.1. Debugging a MySQL Server

If you are using some functionality that is very new in MySQL, you can try to run `mysqld` with the `--skip-new` (which disables all new, potentially unsafe functionality) or with `--safe-mode` which disables a lot of optimization that may cause problems. See Section C.5.4.2, "What to Do If MySQL Keeps Crashing".

If `mysqld` doesn't want to start, you should verify that you don't have any `my.cnf` files that interfere with your setup! You can check your `my.cnf` arguments with `mysqld --print-defaults` and avoid using them by starting with `mysqld --no-defaults ...`.

If `mysqld` starts to eat up CPU or memory or if it "hangs," you can use `mysqladmin processlist status` to find out if someone is executing a query that takes a long time. It may be a good idea to run `mysqladmin -i10 processlist status` in some window if you are experiencing performance problems or problems when new clients can't connect.

The command `mysqladmin debug` dumps some information about locks in use, used memory and query usage to the MySQL log file. This may help solve some problems. This command also provides some useful information even if you haven't compiled MySQL for debugging!

If the problem is that some tables are getting slower and slower you should try to optimize the table with `OPTIMIZE TABLE` or `myisamchk`. See Chapter 5, *MySQL Server Administration*. You should also check the slow queries with `EXPLAIN`.

You should also read the OS-specific section in this manual for problems that may be unique to your environment. See Section 2.1, "General Installation Guidance".

22.5.1.1. Compiling MySQL for Debugging

If you have some very specific problem, you can always try to debug MySQL. To do this you must configure MySQL with the `-DWITH_DEBUG=1` option. You can check whether MySQL was compiled with debugging by doing: `mysqld --help`. If the `--debug` flag is listed with the options then you have debugging enabled. `mysqladmin ver` also lists the `mysqld` version as `mysql ... --debug` in this case.

If `mysqld` stops crashing when you compile it with `-DWITH_DEBUG=1`, you probably have found a compiler bug or a timing bug within MySQL. In this case, you can try to add `-g` to the `CFLAGS` and `CXXFLAGS` environment variables and not use `-DWITH_DEBUG=1`. If `mysqld` dies, you can at least attach to it with `gdb` or use `gdb` on the core file to find out what happened.

When you configure MySQL for debugging you automatically enable a lot of extra safety check functions that monitor the health of `mysqld`. If they find something "unexpected," an entry is written to `stderr`, which `mysqld_safe` directs to the error log! This also means that if you are having some unexpected problems with MySQL and are using a source distribution, the first thing you should do is to configure MySQL for debugging! (The second thing is to send mail to a MySQL mailing list and ask for help. See Section 1.6.1, "MySQL Mailing Lists". If you believe that you have found a bug, please use the instructions at Section 1.7, "How to Report Bugs or Problems".

In the Windows MySQL distribution, `mysqld.exe` is by default compiled with support for trace files.

22.5.1.2. Creating Trace Files

If the `mysqld` server doesn't start or if you can cause it to crash quickly, you can try to create a trace file to find the problem.

To do this, you must have a `mysqld` that has been compiled with debugging support. You can check this by executing `mysqld -V`. If the version number ends with `-debug`, it is compiled with support for trace files. (On Windows, the debugging server is named `mysqld-debug` rather than `mysqld` as of MySQL 4.1.)

Start the `mysqld` server with a trace log in `/tmp/mysqld.trace` on Unix or `C:\mysqld.trace` on Windows:

```
shell> mysqld --debug
```

On Windows, you should also use the `--standalone` flag to not start `mysqld` as a service. In a console window, use this command:

```
C:\> mysqld-debug --debug --standalone
```

After this, you can use the `mysql.exe` command-line tool in a second console window to reproduce the problem. You can stop the `mysqld` server with `mysqladmin shutdown`.

The trace file can become **very large**! To generate a smaller trace file, you can use debugging options something like this:

```
mysqld --debug=d,info,error,query,general,where:O,/tmp/mysqld.trace
```

This only prints information with the most interesting tags to the trace file.

If you make a bug report about this, please only send the lines from the trace file to the appropriate mailing list where something seems to go wrong! If you can't locate the wrong place, you can ftp the trace file, together with a full bug report, to ftp://ftp.mysql.com/pub/mysql/upload/ so that a MySQL developer can take a look at it.

The trace file is made with the **DBUG** package by Fred Fish. See Section 22.5.3, “The DBUG Package”.

22.5.1.3. Using pdb to create a Windows crashdump

Program Database files (extension `pdb`) are included in the Noinstall distribution of MySQL. These files provide information for debugging your MySQL installation in the event of a problem.

The PDB file contains more detailed information about `mysqld` and other tools that enables more detailed trace and dump files to be created. You can use these with Dr Watson, `WinDbg` and Visual Studio to debug `mysqld`.

For more information on PDB files, see Microsoft Knowledge Base Article 121366. For more information on the debugging options available, see Debugging Tools for Windows.

Dr Watson is installed with all Windows distributions, but if you have installed Windows development tools, Dr Watson may have been replaced with WinDbg, the debugger included with Visual Studio, or the debugging tools provided with Borland or Delphi.

To generate a crash file using Dr Watson, follow these steps:

1. Start Dr Watson by running `drwtsn32.exe` interactively using the `-i` option:

   ```
   C:\> drwtsn32 -i
   ```

2. Set the **Log File Path** to the directory where you want to store trace files.
3. Make sure **Dump All Thread Contexts** and **Append To Existing Log File**.
4. Uncheck **Dump Symbol Table**, **Visual Notification**, **Sound Notification** and **Create Crash Dump File**.
5. Set the **Number of Instructions** to a suitable value to capture enough calls in the stacktrace. A value of at 25 should be enough.

Note that the file generated can become very large.

22.5.1.4. Debugging mysqld under gdb

On most systems you can also start `mysqld` from `gdb` to get more information if `mysqld` crashes.

With some older `gdb` versions on Linux you must use `run --one-thread` if you want to be able to debug `mysqld` threads. In this case, you can only have one thread active at a time. It is best to upgrade to `gdb` 5.1 because thread debugging works much better with this version!

NPTL threads (the new thread library on Linux) may cause problems while running `mysqld` under `gdb`. Some symptoms are:

- `mysqld` hangs during startup (before it writes `ready for connections`).
- `mysqld` crashes during a `pthread_mutex_lock()` or `pthread_mutex_unlock()` call.

In this case, you should set the following environment variable in the shell before starting `gdb`:

```
LD_ASSUME_KERNEL=2.4.1
export LD_ASSUME_KERNEL
```

When running `mysqld` under `gdb`, you should disable the stack trace with `--skip-stack-trace` to be able to catch segfaults within `gdb`.

In MySQL 4.0.14 and above you should use the `--gdb` option to `mysqld`. This installs an interrupt handler for `SIGINT` (needed

to stop `mysqld` with `^C` to set breakpoints) and disable stack tracing and core file handling.

It is very hard to debug MySQL under `gdb` if you do a lot of new connections the whole time as `gdb` doesn't free the memory for old threads. You can avoid this problem by starting `mysqld` with `thread_cache_size` set to a value equal to `max_connections` + 1. In most cases just using `--thread_cache_size=5'` helps a lot!

If you want to get a core dump on Linux if `mysqld` dies with a SIGSEGV signal, you can start `mysqld` with the `--core-file` option. This core file can be used to make a backtrace that may help you find out why `mysqld` died:

```
shell> gdb mysqld core
gdb>   backtrace full
gdb>   quit
```

See Section C.5.4.2, “What to Do If MySQL Keeps Crashing”.

If you are using `gdb` 4.17.x or above on Linux, you should install a `.gdb` file, with the following information, in your current directory:

```
set print sevenbit off
handle SIGUSR1 nostop noprint
handle SIGUSR2 nostop noprint
handle SIGWAITING nostop noprint
handle SIGLWP nostop noprint
handle SIGPIPE nostop
handle SIGALRM nostop
handle SIGHUP nostop
handle SIGTERM nostop noprint
```

If you have problems debugging threads with `gdb`, you should download gdb 5.x and try this instead. The new `gdb` version has very improved thread handling!

Here is an example how to debug `mysqld`:

```
shell> gdb /usr/local/libexec/mysqld
gdb> run
...
backtrace full # Do this when mysqld crashes
```

Include the preceding output in a bug report, which you can file using the instructions in Section 1.7, “How to Report Bugs or Problems”.

If `mysqld` hangs, you can try to use some system tools like `strace` or `/usr/proc/bin/pstack` to examine where `mysqld` has hung.

```
strace /tmp/log libexec/mysqld
```

If you are using the Perl `DBI` interface, you can turn on debugging information by using the `trace` method or by setting the `DBI_TRACE` environment variable.

22.5.1.5. Using a Stack Trace

On some operating systems, the error log contains a stack trace if `mysqld` dies unexpectedly. You can use this to find out where (and maybe why) `mysqld` died. See Section 5.2.2, “The Error Log”. To get a stack trace, you must not compile `mysqld` with the `-fomit-frame-pointer` option to gcc. See Section 22.5.1.1, “Compiling MySQL for Debugging”.

A stack trace in the error log looks something like this:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
mysqld(my_print_stacktrace+0x32)[0x9da402]
mysqld(handle_segfault+0x28a)[0x6648e9]
/lib/libpthread.so.0[0x7f1a5af000f0]
/lib/libc.so.6(strcmp+0x2)[0x7f1a5a10f0f2]
mysqld(_Z21check_change_passwordP3THDPKcS2_Pcj+0x7c)[0x7412cb]
mysqld(_ZN16set_var_password5checkEP3THD+0xd0)[0x688354]
mysqld(_Z17sql_set_variablesP3THDP4ListI12set_var_baseE+0x68)[0x688494]
mysqld(_Z21mysql_execute_commandP3THD+0x41a0)[0x67a170]
mysqld(_Z11mysql_parseP3THDPKcjPS2_+0x282)[0x67f0ad]
mysqld(_Z16dispatch_command19enum_server_commandP3THDPcj+0xbb7[0x67fdf8]
mysqld(_Z10do_commandP3THD+0x24d)[0x6811b6]
mysqld(handle_one_connection+0x11c)[0x66e05e]
```

If resolution of function names for the trace fails, the trace contains less information:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
[0x9da402]
[0x6648e9]
[0x7f1a5af000f0]
[0x7f1a5a10f0f2]
[0x7412cb]
[0x688354]
[0x688494]
[0x67a170]
[0x67f0ad]
[0x67fdf8]
[0x6811b6]
[0x66e05e]
```

In the latter case, you can use the `resolve_stack_dump` utility to determine where `mysqld` died by using the following procedure:

1. Copy the numbers from the stack trace to a file, for example `mysqld.stack`. The numbers should not include the surrounding square brackets:

   ```
   0x9da402
   0x6648e9
   0x7f1a5af000f0
   0x7f1a5a10f0f2
   0x7412cb
   0x688354
   0x688494
   0x67a170
   0x67f0ad
   0x67fdf8
   0x6811b6
   0x66e05e
   ```

2. Make a symbol file for the `mysqld` server:

   ```
   shell> nm -n libexec/mysqld > /tmp/mysqld.sym
   ```

   If `mysqld` is not linked statically, use the following command instead:

   ```
   shell> nm -D -n libexec/mysqld > /tmp/mysqld.sym
   ```

   If you want to decode C++ symbols, use the `--demangle`, if available, to `nm`. If your version of `nm` does not have this option, you will need to use the `c++filt` command after the stack dump has been produced to demangle the C++ names.

3. Execute the following command:

   ```
   shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack
   ```

   If you were not able to include demangled C++ names in your symbol file, process the `resolve_stack_dump` output using `c++filt`:

   ```
   shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack | c++filt
   ```

   This prints out where `mysqld` died. If that does not help you find out why `mysqld` died, you should create a bug report and include the output from the preceding command with the bug report.

   However, in most cases it does not help us to have just a stack trace to find the reason for the problem. To be able to locate the bug or provide a workaround, in most cases we need to know the statement that killed `mysqld` and preferably a test case so that we can repeat the problem! See Section 1.7, “How to Report Bugs or Problems”.

Newer versions of `glibc` stack trace functions also print the address as relative to the object. On `glibc`-based systems (Linux), the trace for a crash within a plugin looks something like:

```
plugin/auth/auth_test_plugin.so(+0x9a6)[0x7ff4d11c29a6]
```

To translate the relative address (`+0x9a6`) into a file name and line number, use this command:

```
shell> addr2line -fie auth_test_plugin.so 0x9a6
auth_test_plugin
```

```
mysql-trunk/plugin/auth/test_plugin.c:65
```

The `addr2line` utility is part of the `binutils` package on Linux.

On Solaris, the procedure is similar. The Solaris `printstack()` already prints relative addresses:

```
plugin/auth/auth_test_plugin.so:0x1510
```

To translate, use this command:

```
shell> gaddr2line -fie auth_test_plugin.so 0x1510
mysql-trunk/plugin/auth/test_plugin.c:88
```

Windows already prints the address, function name and line:

```
000007FEF07E10A4 auth_test_plugin.dll!auth_test_plugin()[test_plugin.c:72]
```

22.5.1.6. Using Server Logs to Find Causes of Errors in `mysqld`

Note that before starting `mysqld` with the general query log enabled, you should check all your tables with `myisamchk`. See Chapter 5, *MySQL Server Administration*.

If `mysqld` dies or hangs, you should start `mysqld` with the general query log enabled. See Section 5.2.3, “The General Query Log”. When `mysqld` dies again, you can examine the end of the log file for the query that killed `mysqld`.

If you use the default general query log file, the log is stored in the database directory as *`host_name`*`.log` In most cases it is the last query in the log file that killed `mysqld`, but if possible you should verify this by restarting `mysqld` and executing the found query from the `mysql` command-line tools. If this works, you should also test all complicated queries that didn't complete.

You can also try the command `EXPLAIN` on all `SELECT` statements that takes a long time to ensure that `mysqld` is using indexes properly. See Section 12.8.2, “`EXPLAIN` Syntax”.

You can find the queries that take a long time to execute by starting `mysqld` with the slow query log enabled. See Section 5.2.5, “The Slow Query Log”.

If you find the text `mysqld restarted` in the error log file (normally named `hostname.err`) you probably have found a query that causes `mysqld` to fail. If this happens, you should check all your tables with `myisamchk` (see Chapter 5, *MySQL Server Administration*), and test the queries in the MySQL log files to see whether one fails. If you find such a query, try first upgrading to the newest MySQL version. If this doesn't help and you can't find anything in the `mysql` mail archive, you should report the bug to a MySQL mailing list. The mailing lists are described at http://lists.mysql.com/, which also has links to online list archives.

If you have started `mysqld` with `--myisam-recover-options`, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file `'Warning: Checking table ...'` which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further. See Section 5.1.2, “Server Command Options”.

As of MySQL 5.5.3, when the server detects `MyISAM` table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: `Got an error from thread_id=1, mi_dynrec.c:368`. This is useful information to include in bug reports.

It is not a good sign if `mysqld` did die unexpectedly, but in this case, you should not investigate the `Checking table...` messages, but instead try to find out why `mysqld` died.

22.5.1.7. Making a Test Case If You Experience Table Corruption

If you get corrupted tables or if `mysqld` always fails after some update commands, you can test whether this bug is reproducible by doing the following:

- Take down the MySQL daemon (with `mysqladmin shutdown`).
- Make a backup of the tables (to guard against the very unlikely case that the repair does something bad).
- Check all tables with `myisamchk -s database/*.MYI`. Repair any wrong tables with `myisamchk -r database/`*`table`*`.MYI`.
- Make a second backup of the tables.
- Remove (or move away) any old log files from the MySQL data directory if you need more space.

- Start `mysqld` with the binary log enabled. If you want to find a query that crashes `mysqld`, you should start the server with both the general query log enabled as well. See Section 5.2.3, “The General Query Log”, and Section 5.2.4, “The Binary Log”.
- When you have gotten a crashed table, stop the `mysqld server`.
- Restore the backup.
- Restart the `mysqld` server **without** the binary log enabled.
- Re-execute the commands with `mysqlbinlog binary-log-file | mysql`. The binary log is saved in the MySQL database directory with the name `hostname-bin.NNNNNN`.
- If the tables are corrupted again or you can get `mysqld` to die with the above command, you have found reproducible bug that should be easy to fix! FTP the tables and the binary log to ftp://ftp.mysql.com/pub/mysql/upload/ and report it in our bugs database using the instructions given in Section 1.7, “How to Report Bugs or Problems”. (Please note that the `/pub/mysql/upload/` FTP directory is not listable, so you'll not see what you've uploaded in your FTP client.) If you are a support customer, you can use the MySQL Customer Support Center https://support.mysql.com/ to alert the MySQL team about the problem and have it fixed as soon as possible.

You can also use the script `mysql_find_rows` to just execute some of the update statements if you want to narrow down the problem.

22.5.2. Debugging a MySQL Client

To be able to debug a MySQL client with the integrated debug package, you should configure MySQL with `-DWITH_DEBUG=1`. See Section 2.9.4, “MySQL Source-Configuration Options”.

Before running a client, you should set the `MYSQL_DEBUG` environment variable:

```
shell> MYSQL_DEBUG=d:t:O,/tmp/client.trace
shell> export MYSQL_DEBUG
```

This causes clients to generate a trace file in `/tmp/client.trace`.

If you have problems with your own client code, you should attempt to connect to the server and run your query using a client that is known to work. Do this by running `mysql` in debugging mode (assuming that you have compiled MySQL with debugging on):

```
shell> mysql --debug=d:t:O,/tmp/client.trace
```

This provides useful information in case you mail a bug report. See Section 1.7, “How to Report Bugs or Problems”.

If your client crashes at some 'legal' looking code, you should check that your `mysql.h` include file matches your MySQL library file. A very common mistake is to use an old `mysql.h` file from an old MySQL installation with new MySQL library.

22.5.3. The DBUG Package

The MySQL server and most MySQL clients are compiled with the DBUG package originally created by Fred Fish. When you have configured MySQL for debugging, this package makes it possible to get a trace file of what the program is debugging. See Section 22.5.1.2, “Creating Trace Files”.

This section summaries the argument values that you can specify in debug options on the command line for MySQL programs that have been built with debugging support. For more information about programming with the DBUG package, see the DBUG manual in the `dbug` directory of MySQL source distributions. It is best to use a recent distribution to get the most updated DBUG manual.

You use the debug package by invoking a program with the `--debug="..."` or the `-#...` option.

Most MySQL programs have a default debug string that is used if you don't specify an option to `--debug`. The default trace file is usually `/tmp/program_name.trace` on Unix and `\program_name.trace` on Windows.

The debug control string is a sequence of colon-separated fields as follows:

```
<field_1>:<field_2>:...:<field_N>
```

Each field consists of a mandatory flag character followed by an optional “`,`” and comma-separated list of modifiers:

```
flag[,modifier,modifier,...,modifier]
```

The following table shows the currently recognized flag characters.

Flag	Description
d	Enable output from DBUG_<N> macros for the current state. May be followed by a list of keywords which selects output only for the DBUG macros with that keyword. An empty list of keywords implies output for all macros.
D	Delay after each debugger output line. The argument is the number of tenths of seconds to delay, subject to machine capabilities. For example, `-#D,20` specifies a delay of two seconds.
f	Limit debugging, tracing, and profiling to the list of named functions. Note that a null list disables all functions. The appropriate `d` or `t` flags must still be given; this flag only limits their actions if they are enabled.
F	Identify the source file name for each line of debug or trace output.
i	Identify the process with the PID or thread ID for each line of debug or trace output.
g	Enable profiling. Create a file called `dbugmon.out` containing information that can be used to profile the program. May be followed by a list of keywords that select profiling only for the functions in that list. A null list implies that all functions are considered.
L	Identify the source file line number for each line of debug or trace output.
n	Print the current function nesting depth for each line of debug or trace output.
N	Number each line of debug output.
o	Redirect the debugger output stream to the specified file. The default output is `stderr`.
O	Like `o`, but the file is really flushed between each write. When needed, the file is closed and reopened between each write.
p	Limit debugger actions to specified processes. A process must be identified with the `DBUG_PROCESS` macro and match one in the list for debugger actions to occur.
P	Print the current process name for each line of debug or trace output.
r	When pushing a new state, do not inherit the previous state's function nesting level. Useful when the output is to start at the left margin.
S	Do function `_sanity(_file_,_line_)` at each debugged function until `_sanity()` returns something that differs from 0.
t	Enable function call/exit trace lines. May be followed by a list (containing only one modifier) giving a numeric maximum trace level, beyond which no output occurs for either debugging or tracing macros. The default is a compile time option.

Some examples of debug control strings that might appear on a shell command line (the `-#` is typically used to introduce a control string to an application program) are:

```
-#d:t
-#d:f,main,subr1:F:L:t,20
-#d,input,output,files:n
-#d:t:i:O,\\mysqld.trace
```

In MySQL, common tags to print (with the `d` option) are `enter`, `exit`, `error`, `warning`, `info`, and `loop`.

Chapter 23. MySQL Enterprise Monitor

MySQL Enterprise Monitor is an enterprise monitoring system for MySQL that keeps an eye on your MySQL servers, notifies you of potential issues and problems, and advises you how to fix the issues. MySQL Enterprise Monitor can monitor all kinds of configurations, from a single MySQL server that is important to your business, all the way up to a huge farm of MySQL servers powering a busy web site.

The following discussion briefly describes the basic components that make up the MySQL Enterprise Monitor product. For more information, see the MySQL Enterprise Monitor manual, available at http://dev.mysql.com/doc/mysql-monitor/en/.

MySQL Enterprise Monitor components can be installed in various configurations depending on your own database and network topology, to give you the best combination of reliable and responsive monitoring data, with minimal overhead on the database server machines. A typical MySQL Enterprise Monitor installation consists of:

- One or more MySQL servers that you want to monitor. MySQL Enterprise Monitor can monitor both Community and Enterprise MySQL server releases.
- A MySQL Enterprise Agent for each monitored MySQL server.
- A single MySQL Enterprise Service Manager, which collates information from the agents, and provides the user interface to the collected data.

MySQL Enterprise Monitor is designed to monitor one or more MySQL servers. The monitoring information is collected by using an agent, *MySQL Enterprise Agent*. The agent communicates with the MySQL server that it monitors, collecting variables, status and health information, and sending this information to the MySQL Enterprise Service Manager. If you have multiple MySQL servers, then you have multiple MySQL Enterprise Agent processes monitoring each MySQL server.

The information collected by the agent about each MySQL server you are monitoring is sent to the *MySQL Enterprise Service Manager*. This server collates all of the information from the agents. As it collates the information sent by the agents, the MySQL Enterprise Service Manager continually tests the collected data, comparing the status of the server to reasonable values. When thresholds are reached, the server can trigger an event (including an alarm and notification) to highlight a potential issue, such as low memory, high CPU usage, or more complex conditions such insufficient buffer sizes and status information. We call each test, with its associated threshold value, a *rule*.

These rules, and the alarms and notifications, are each known as a *MySQL Enterprise Advisor*. Advisors form a critical part of the MySQL Enterprise Service Manager, as they provide warning information and troubleshooting advice about potential problems.

The MySQL Enterprise Service Manager includes a web server, and you interact with it through any web browser. This interface, the MySQL Enterprise Dashboard, displays all of the information collected by the agents, and lets you view all of your servers and their current status as a group or individually. You control and configure all aspects of the service using the MySQL Enterprise Dashboard.

The information supplied by the MySQL Enterprise Agent processes also includes statistical and query information, which you can view in the form of graphs. For example, you can view aspects such as server load, query numbers, or index usage information as a graph over time. The graph lets you pinpoint problems or potential issues on your server, and can help diagnose the impact from database or external problems (such as external system or network failure) by examining the data from a specific time interval.

The MySQL Enterprise Agent can also be configured to collect detailed information about the queries executed on your server, including the row counts and performance times for executing each query. You can correlate the detailed query data with the graphical information to identify which queries were executing when you experienced a particularly high load, index or other issue. The query data is supported by a system called Query Analyzer, and the data can be presented in different ways depending on your needs.

Chapter 24. MySQL Enterprise Backup

The MySQL Enterprise Backup product performs hot backup operations for MySQL databases. The product is architected for efficient and reliable backups of tables created by the InnoDB storage engine. For completeness, it can also back up tables from MyISAM and other storage engines.

Hot backups are performed while the database is running. This type of backup does not block normal database operations, and it captures even changes that occur while the backup is happening. For these reasons, hot backups are desirable when your database "grows up" -- when the data is large enough that the backup takes significant time, and when your data is important enough to your business so that you must capture every last change, without taking your application, web site, or web service offline.

MySQL Enterprise Backup does a hot backup of all tables that use the InnoDB storage engine. For tables using MyISAM or other non-InnoDB storage engines, it does a "warm" backup, where the database continues to run, but those tables cannot be modified while being backed up. For efficient backup operations, you can designate InnoDB as the default storage engine for new tables, or convert existing tables to use the InnoDB storage engine.

For more information, see the MySQL Enterprise Backup manual, available at http://dev.mysql.com/doc/mysql-enterprise-backup/en/.

Chapter 25. MySQL Workbench

MySQL Workbench provides a graphical tool for working with MySQL Servers and databases. MySQL Workbench fully supports MySQL Server versions 5.1 and above. It is also compatible with MySQL Server 5.0, but not every feature of 5.0 may be supported. It does not support MySQL Server versions 4.x.

The following discussion briefly describes MySQL Workbench capabilities. For more information, see the MySQL Workbench manual, available at http://dev.mysql.com/doc/workbench/en/.

MySQL Workbench provides three main areas of functionality:

- **SQL Development**: Enables you to create and manage connections to database servers. As well as enabling you to configure connection parameters, MySQL Workbench provides the capability to execute SQL queries on the database connections using the built-in SQL Editor. This functionality replaces that previously provided by the Query Browser standalone application.
- **Data Modeling**: Enables you to create models of your database schema graphically, reverse and forward engineer between a schema and a live database, and edit all aspects of your database using the comprehensive Table Editor. The Table Editor provides easy-to-use facilities for editing Tables, Columns, Indexes, Triggers, Partitioning, Options, Inserts and Privileges, Routines and Views.
- **Server Administration**: Enables you to create and administer server instances. This functionality replaces that previously provided by the MySQL Administrator standalone application.

MySQL Workbench is available in two editions, the Community Edition and the Standard Edition. The Community Edition is available free of charge. The Standard Edition provides additional Enterprise features, such as database documentation generation, at low cost.

Appendix A. Licenses for Third-Party Components

Table of Contents

A.1. Ant-Contrib License 2840
A.2. ANTLR 3.3 License 2841

A.33. Richard A. O'Keefe String Library License 2869
A.34. SHA-1 in C License 2869
A.35. Simple Logging Facade for Java (SLF4J) License 2869
A.36. `zlib` License 2870
A.37. ZLIB.NET License 2870

The following is a list of the libraries we have included with the MySQL Server source and components used to test MySQL. We are thankful to all individuals that have created these. Some of the components require that their licensing terms be included in the documentation of products that include them. Cross references to these licensing terms are given with the applicable items in the list.

- GroupLens Research Project

  The MySQL Quality Assurance team would like to acknowledge the use of the MovieLens Data Sets (10 million ratings and 100,000 tags for 10681 movies by 71567 users) to help test MySQL products and to thank the GroupLens Research Project at the University of Minnesota for making the data sets available.

A.7. Fred Fish's Dbug Library License

The following software may be included in this product:

Fred Fish's Dbug Library

```
                              N O T I C E

                   Copyright Abandoned, 1987, Fred Fish

     This previously copyrighted work has been placed into the  public
     domain  by  the  author  and  may be freely used for any purpose,
     private or commercial.

     Because of the number of inquiries I was receiving about the  use
     of this product in commercially developed works I have decided to
     simply make it public domain to further its unrestricted use.   I
     specifically  would  be  most happy to see this material become a
     part of the standard Unix distributions by AT&T and the  Berkeley
     Computer  Science  Research Group, and a standard part of the GNU
     system from the Free Software Foundation.

     I would appreciate it, as a courtesy, if this notice is  left  in
     all copies and derivative works.  Thank you.

     The author makes no warranty of any kind  with  respect  to  this
     product  and  explicitly disclaims any implied warranties of mer-
     chantability or fitness for any particular purpose.
The dbug_analyze.c file is subject to the following notice:

     Copyright June 1987, Binayak Banerjee
     All rights reserved.

     This program may be freely distributed under the same terms and
     conditions as Fred Fish's Dbug package.
```

A.8. `getarg` License

The following software may be included in this product:

`getarg` Function (`getarg.h`, `getarg.c` files)

```
Copyright (c) 1997 – 2000 Kungliga Tekniska Högskolan
(Royal Institute of Technology, Stockholm, Sweden).

DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE
GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS
INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY,
WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING
NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF
THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH
DAMAGE.
```

A.9. GLib License (for MySQL Proxy)

The following software may be included in this product:

```
GLib

You are receiving a copy of the GLib library in both source
and object code in the following [proxy install dir]/lib/ and
[proxy install dir]/licenses/lgpl folders. The terms of the
Oracle license do NOT apply to the GLib library; it is licensed
under the following license, separately from the Oracle programs
you receive. If you do not wish to install this library, you may
create an "exclude" file and run tar with the X option, as in
the following example, but the Oracle program might not operate
properly or at all without the library:
  tar -xvfX <package-tar-file> <exclude-file>
where the exclude-file contains, e.g.:
  <package-name>/lib/libglib-2.0.so.0.1600.6
  <package-name>/lib/libglib-2.0.so.0
  ...

Example:
tar -xvfX mysql-proxy-0.8.1-solaris10-x86-64bit.tar.gz Exclude

Exclude File:
mysql-proxy-0.8.1-solaris10-x86-64bit/lib/libglib-2.0.so
mysql-proxy-0.8.1-solaris10-x86-64bit/lib/libglib-2.0.so.0
mysql-proxy-0.8.1-solaris10-x86-64bit/lib/libglib-2.0.so.0.1600.6
mysql-proxy-0.8.1-solaris10-x86-64bit/lib/libgmodule-2.0.so
mysql-proxy-0.8.1-solaris10-x86-64bit/lib/libgmodule-2.0.so.0
mysql-proxy-0.8.1-solaris10-x86-64bit/lib/libgmodule-2.0.so.0.1600.6
mysql-proxy-0.8.1-solaris10-x86-64bit/lib/libgthread-2.0.so
mysql-proxy-0.8.1-solaris10-x86-64bit/lib/libgthread-2.0.so.0
mysql-proxy-0.8.1-solaris10-x86-64bit/lib/libgthread-2.0.so.0.1600.6
mysql-proxy-0.8.1-solaris10-x86-64bit/licenses/lgpl/glib-2.16.6.tar.gz

GNU GENERAL PUBLIC LICENSE
Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.,
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA
Everyone is permitted to copy and distribute verbatim
copies of this license document, but changing it is not
allowed.

                    Preamble

  The licenses for most software are designed to take away your
freedom to share and change it.  By contrast, the GNU General Public
License is intended to guarantee your freedom to share and change free
software--to make sure the software is free for all its users.  This
General Public License applies to most of the Free Software
Foundation's software and to any other program whose authors commit to
using it.  (Some other Free Software Foundation software is covered by
the GNU Lesser General Public License instead.)  You can apply it to
your programs, too.

  When we speak of free software, we are referring to freedom, not
price.  Our General Public Licenses are designed to make sure that you
have the freedom to distribute copies of free software (and charge for
this service if you wish), that you receive source code or can get it
if you want it, that you can change the software or use pieces of it
in new free programs; and that you know you can do these things.

  To protect your rights, we need to make restrictions that forbid
anyone to deny you these rights or to ask you to surrender the rights.
These restrictions translate to certain responsibilities for you if you
distribute copies of the software, or if you modify it.

  For example, if you distribute copies of such a program, whether
gratis or for a fee, you must give the recipients all the rights that
you have.  You must make sure that they, too, receive or can get the
source code.  And you must show them these terms so they know their
rights.

  We protect your rights with two steps: (1) copyright the software,
and (2) offer you this license which gives you legal permission to
copy, distribute and/or modify the software.

  Also, for each author's protection and ours, we want to make certain
that everyone understands that there is no warranty for this free
software.  If the software is modified by someone else and passed on,
we want its recipients to know that what they have is not the original,
so that any problems introduced by others will not reflect on the
original authors' reputations.

  Finally, any free program is threatened constantly by software
patents.  We wish to avoid the danger that redistributors of a free
program will individually obtain patent licenses, in effect making the
program proprietary.  To prevent this, we have made it clear that any
patent must be licensed for everyone's free use or not licensed at all.

  The precise terms and conditions for copying, distribution and
modification follow.

                    GNU GENERAL PUBLIC LICENSE
   TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

  0. This License applies to any program or other work which contains
a notice placed by the copyright holder saying it may be distributed
under the terms of this General Public License.  The "Program", below,
refers to any such program or work, and a "work based on the Program"
means either the Program or any derivative work under copyright law:
that is to say, a work containing the Program or a portion of it,
either verbatim or with modifications and/or translated into another
language.  (Hereinafter, translation is included without limitation in
the term "modification".)  Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not
covered by this License; they are outside its scope.  The act of
running the Program is not restricted, and the output from the Program
is covered only if its contents constitute a work based on the
Program (independent of having been made by running the Program).
Whether that is true depends on what the Program does.

  1. You may copy and distribute verbatim copies of the Program's
source code as you receive it, in any medium, provided that you
conspicuously and appropriately publish on each copy an appropriate
copyright notice and disclaimer of warranty; keep intact all the
notices that refer to this License and to the absence of any warranty;
and give any other recipients of the Program a copy of this License
along with the Program.

You may charge a fee for the physical act of transferring a copy, and
you may at your option offer warranty protection in exchange for a fee.

  2. You may modify your copy or copies of the Program or any portion
of it, thus forming a work based on the Program, and copy and
```

```
distribute such modifications or work under the terms of Section 1
above, provided that you also meet all of these conditions:

    a) You must cause the modified files to carry prominent notices
    stating that you changed the files and the date of any change.

    b) You must cause any work that you distribute or publish, that in
    whole or in part contains or is derived from the Program or any
    part thereof, to be licensed as a whole at no charge to all third
    parties under the terms of this License.

    c) If the modified program normally reads commands interactively
    when run, you must cause it, when started running for such
    interactive use in the most ordinary way, to print or display an
    announcement including an appropriate copyright notice and a
    notice that there is no warranty (or else, saying that you provide
    a warranty) and that users may redistribute the program under
    these conditions, and telling the user how to view a copy of this
    License.  (Exception: if the Program itself is interactive but
    does not normally print such an announcement, your work based on
    the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole.  If
identifiable sections of that work are not derived from the Program,
and can be reasonably considered independent and separate works in
themselves, then this License, and its terms, do not apply to those
sections when you distribute them as separate works.  But when you
distribute the same sections as part of a whole which is a work based
on the Program, the distribution of the whole must be on the terms of
this License, whose permissions for other licensees extend to the
entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest
your rights to work written entirely by you; rather, the intent is to
exercise the right to control the distribution of derivative or
collective works based on the Program.

In addition, mere aggregation of another work not based on the Program
with the Program (or with a work based on the Program) on a volume of
a storage or distribution medium does not bring the other work under
the scope of this License.

  3. You may copy and distribute the Program (or a work based on it,
under Section 2) in object code or executable form under the terms of
Sections 1 and 2 above provided that you also do one of the following:

    a) Accompany it with the complete corresponding machine-readable
    source code, which must be distributed under the terms of Sections
    1 and 2 above on a medium customarily used for software
    interchange; or,

    b) Accompany it with a written offer, valid for at least three
    years, to give any third party, for a charge no more than your
    cost of physically performing source distribution, a complete
    machine-readable copy of the corresponding source code, to be
    distributed under the terms of Sections 1 and 2 above on a medium
    customarily used for software interchange; or,

    c) Accompany it with the information you received as to the offer
    to distribute corresponding source code.  (This alternative is
    allowed only for noncommercial distribution and only if you
    received the program in object code or executable form with such
    an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for
making modifications to it.  For an executable work, complete source
code means all the source code for all modules it contains, plus any
associated interface definition files, plus the scripts used to
control compilation and installation of the executable.  However, as
a special exception, the source code distributed need not include
anything that is normally distributed (in either source or binary
form) with the major components (compiler, kernel, and so on) of the
operating system on which the executable runs, unless that component
itself accompanies the executable.

If distribution of executable or object code is made by offering
access to copy from a designated place, then offering equivalent
access to copy the source code from the same place counts as
distribution of the source code, even though third parties are not
compelled to copy the source along with the object code.

  4. You may not copy, modify, sublicense, or distribute the Program
except as expressly provided under this License.  Any attempt
otherwise to copy, modify, sublicense or distribute the Program is
void, and will automatically terminate your rights under this License.
However, parties who have received copies, or rights, from you under
this License will not have their licenses terminated so long as such
parties remain in full compliance.

  5. You are not required to accept this License, since you have not
signed it.  However, nothing else grants you permission to modify or
distribute the Program or its derivative works.  These actions are
prohibited by law if you do not accept this License.  Therefore, by
modifying or distributing the Program (or any work based on the
Program), you indicate your acceptance of this License to do so, and
all its terms and conditions for copying, distributing or modifying
the Program or works based on it.
```

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

```
  If you develop a new program, and you want it to be of the greatest
possible use to the public, the best way to achieve this is to make it
free software which everyone can redistribute and change under these terms.

  To do so, attach the following notices to the program.  It is safest
to attach them to the start of each source file to most effectively
convey the exclusion of warranty; and each file should have at least
the "copyright" line and a pointer to where the full notice is found.

    <one line to give the program's name and a brief idea of what it
    does.>
    Copyright (C) <year>  <name of author>

    This program is free software; you can redistribute it and/or
    modify it under the terms of the GNU General Public License as
    published by     the Free Software Foundation; either version
    2 of the License, or (at your option) any later version.

    This program is distributed in the hope that it will be useful,
    but WITHOUT ANY WARRANTY; without even the implied warranty of
    MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE.  See the
    GNU General Public License for more details.

    You should have received a copy of the GNU General Public License
    along with this program; if not, write to the Free Software
    Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA
    02110-1301 USA.

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this
when it starts in an interactive mode:

    Gnomovision version 69, Copyright (C) year name of author
    Gnomovision comes with ABSOLUTELY NO WARRANTY; for details
    type 'show w'. This is free software, and you are welcome
    to redistribute it under certain conditions; type 'show c'
    for details.

The hypothetical commands 'show w' and 'show c' should show the
appropriate parts of the General Public License.  Of course, the
commands you use may be called something other than 'show w' and
'show c'; they could even be mouse-clicks or menu items--whatever
suits your program.

You should also get your employer (if you work as a programmer) or your
school, if any, to sign a "copyright disclaimer" for the program, if
necessary.  Here is a sample; alter the names:

  Yoyodyne, Inc., hereby disclaims all copyright interest in the
  program 'Gnomovision' (which makes passes at compilers) written
  by James Hacker.

  <signature of Ty Coon>, 1 April 1989
  Ty Coon, President of Vice

This General Public License does not permit incorporating your program
into proprietary programs.  If your program is a subroutine library,
you may consider it more useful to permit linking proprietary
applications with the library.  If this is what you want to do, use
the GNU Lesser General Public License instead of this License.
```

A.11. GNU Lesser General Public License Version 2.1, February 1999

```
The following applies to all products licensed under the
GNU Lesser General Public License, Version 2.1: You may
not use the identified files except in compliance with
the GNU Lesser General Public License, Version 2.1 (the
"License"). You may obtain a copy of the License at
http://www.gnu.org/licenses/lgpl-2.1.html. A copy of the
license is also reproduced below. Unless required by
applicable law or agreed to in writing, software distributed
under the License is distributed on an "AS IS" BASIS,
WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express
or implied. See the License for the specific language governing
permissions and limitations under the License.

                  GNU LESSER GENERAL PUBLIC LICENSE
                       Version 2.1, February 1999

 Copyright (C) 1991, 1999 Free Software Foundation, Inc.
 51 Franklin Street, Fifth Floor, Boston, MA  02110-1301  USA
 Everyone is permitted to copy and distribute verbatim copies
 of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL.  It also counts
 as the successor of the GNU Library Public License, version 2, hence
 the version number 2.1.]

                            Preamble

  The licenses for most software are designed to take away your
freedom to share and change it.  By contrast, the GNU General Public
```

```
Licenses are intended to guarantee your freedom to share and change
free software--to make sure the software is free for all its users.

  This license, the Lesser General Public License, applies to some
specially designated software packages--typically libraries--of the
Free Software Foundation and other authors who decide to use it.  You
can use it too, but we suggest you first think carefully about whether
this license or the ordinary General Public License is the better
strategy to use in any particular case, based on the explanations below.

  When we speak of free software, we are referring to freedom of use,
not price.  Our General Public Licenses are designed to make sure that
you have the freedom to distribute copies of free software (and charge
for this service if you wish); that you receive source code or can get
it if you want it; that you can change the software and use pieces of
it in new free programs; and that you are informed that you can do
these things.

  To protect your rights, we need to make restrictions that forbid
distributors to deny you these rights or to ask you to surrender these
rights.  These restrictions translate to certain responsibilities for
you if you distribute copies of the library or if you modify it.

  For example, if you distribute copies of the library, whether gratis
or for a fee, you must give the recipients all the rights that we gave
you.  You must make sure that they, too, receive or can get the source
code.  If you link other code with the library, you must provide
complete object files to the recipients, so that they can relink them
with the library after making changes to the library and recompiling
it.  And you must show them these terms so they know their rights.

  We protect your rights with a two-step method: (1) we copyright the
library, and (2) we offer you this license, which gives you legal
permission to copy, distribute and/or modify the library.

  To protect each distributor, we want to make it very clear that
there is no warranty for the free library.  Also, if the library is
modified by someone else and passed on, the recipients should know
that what they have is not the original version, so that the original
author's reputation will not be affected by problems that might be
introduced by others.

  Finally, software patents pose a constant threat to the existence of
any free program.  We wish to make sure that a company cannot
effectively restrict the users of a free program by obtaining a
restrictive license from a patent holder.  Therefore, we insist that
any patent license obtained for a version of the library must be
consistent with the full freedom of use specified in this license.

  Most GNU software, including some libraries, is covered by the
ordinary GNU General Public License.  This license, the GNU Lesser
General Public License, applies to certain designated libraries, and
is quite different from the ordinary General Public License.  We use
this license for certain libraries in order to permit linking those
libraries into non-free programs.

  When a program is linked with a library, whether statically or using
a shared library, the combination of the two is legally speaking a
combined work, a derivative of the original library.  The ordinary
General Public License therefore permits such linking only if the
entire combination fits its criteria of freedom.  The Lesser General
Public License permits more lax criteria for linking other code with
the library.

  We call this license the "Lesser" General Public License because it
does Less to protect the user's freedom than the ordinary General
Public License.  It also provides other free software developers Less
of an advantage over competing non-free programs.  These disadvantages
are the reason we use the ordinary General Public License for many
libraries.  However, the Lesser license provides advantages in certain
special circumstances.

  For example, on rare occasions, there may be a special need to
encourage the widest possible use of a certain library, so that it
becomes a de-facto standard.  To achieve this, non-free programs
must be allowed to use the library.  A more frequent case is that
a free library does the same job as widely used non-free libraries.
In this case, there is little to gain by limiting the free library
to free software only, so we use the Lesser General Public License.

  In other cases, permission to use a particular library in non-free
programs enables a greater number of people to use a large body of
free software.  For example, permission to use the GNU C Library in
non-free programs enables many more people to use the whole GNU
operating system, as well as its variant, the GNU/Linux operating
system.

  Although the Lesser General Public License is Less protective of the
users' freedom, it does ensure that the user of a program that is
linked with the Library has the freedom and the wherewithal to run
that program using a modified version of the Library.

  The precise terms and conditions for copying, distribution and
modification follow.  Pay close attention to the difference between a
"work based on the library" and a "work that uses the library".  The
former contains code derived from the library, whereas the latter must
be combined with the library in order to run.
```

```
                GNU LESSER GENERAL PUBLIC LICENSE
   TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

  0. This License Agreement applies to any software library or other
program which contains a notice placed by the copyright holder or
other authorized party saying it may be distributed under the terms of
this Lesser General Public License (also called "this License").
Each licensee is addressed as "you".

  A "library" means a collection of software functions and/or data
prepared so as to be conveniently linked with application programs
(which use some of those functions and data) to form executables.

  The "Library", below, refers to any such software library or work
which has been distributed under these terms.  A "work based on the
Library" means either the Library or any derivative work under
copyright law: that is to say, a work containing the Library or a
portion of it, either verbatim or with modifications and/or translated
straightforwardly into another language.  (Hereinafter, translation is
included without limitation in the term "modification".)

  "Source code" for a work means the preferred form of the work for
making modifications to it.  For a library, complete source code means
all the source code for all modules it contains, plus any associated
interface definition files, plus the scripts used to control
compilation and installation of the library.

  Activities other than copying, distribution and modification are not
covered by this License; they are outside its scope.  The act of
running a program using the Library is not restricted, and output from
such a program is covered only if its contents constitute a work based
on the Library (independent of the use of the Library in a tool for
writing it).  Whether that is true depends on what the Library does
and what the program that uses the Library does.

  1. You may copy and distribute verbatim copies of the Library's
complete source code as you receive it, in any medium, provided that
you conspicuously and appropriately publish on each copy an
appropriate copyright notice and disclaimer of warranty; keep intact
all the notices that refer to this License and to the absence of any
warranty; and distribute a copy of this License along with the
Library.

  You may charge a fee for the physical act of transferring a copy,
and you may at your option offer warranty protection in exchange for a
fee.

  2. You may modify your copy or copies of the Library or any portion
of it, thus forming a work based on the Library, and copy and
distribute such modifications or work under the terms of Section 1
above, provided that you also meet all of these conditions:

    a) The modified work must itself be a software library.

    b) You must cause the files modified to carry prominent notices
    stating that you changed the files and the date of any change.

    c) You must cause the whole of the work to be licensed at no
    charge to all third parties under the terms of this License.

    d) If a facility in the modified Library refers to a function or a
    table of data to be supplied by an application program that uses
    the facility, other than as an argument passed when the facility
    is invoked, then you must make a good faith effort to ensure that,
    in the event an application does not supply such function or
    table, the facility still operates, and performs whatever part of
    its purpose remains meaningful.

    (For example, a function in a library to compute square roots has
    a purpose that is entirely well-defined independent of the
    application.  Therefore, Subsection 2d requires that any
    application-supplied function or table used by this function must
    be optional: if the application does not supply it, the square
    root function must still compute square roots.)

These requirements apply to the modified work as a whole.  If
identifiable sections of that work are not derived from the Library,
and can be reasonably considered independent and separate works in
themselves, then this License, and its terms, do not apply to those
sections when you distribute them as separate works.  But when you
distribute the same sections as part of a whole which is a work based
on the Library, the distribution of the whole must be on the terms of
this License, whose permissions for other licensees extend to the
entire whole, and thus to each and every part regardless of who wrote
it.

Thus, it is not the intent of this section to claim rights or contest
your rights to work written entirely by you; rather, the intent is to
exercise the right to control the distribution of derivative or
collective works based on the Library.

In addition, mere aggregation of another work not based on the Library
with the Library (or with a work based on the Library) on a volume of
a storage or distribution medium does not bring the other work under
the scope of this License.
```

```
  3. You may opt to apply the terms of the ordinary GNU General Public
License instead of this License to a given copy of the Library.  To do
this, you must alter all the notices that refer to this License, so
that they refer to the ordinary GNU General Public License, version 2,
instead of to this License.  (If a newer version than version 2 of the
ordinary GNU General Public License has appeared, then you can specify
that version instead if you wish.)  Do not make any other change in
these notices.

  Once this change is made in a given copy, it is irreversible for
that copy, so the ordinary GNU General Public License applies to all
subsequent copies and derivative works made from that copy.

  This option is useful when you wish to copy part of the code of
the Library into a program that is not a library.

  4. You may copy and distribute the Library (or a portion or
derivative of it, under Section 2) in object code or executable form
under the terms of Sections 1 and 2 above provided that you accompany
it with the complete corresponding machine-readable source code, which
must be distributed under the terms of Sections 1 and 2 above on a
medium customarily used for software interchange.

  If distribution of object code is made by offering access to copy
from a designated place, then offering equivalent access to copy the
source code from the same place satisfies the requirement to
distribute the source code, even though third parties are not
compelled to copy the source along with the object code.

  5. A program that contains no derivative of any portion of the
Library, but is designed to work with the Library by being compiled or
linked with it, is called a "work that uses the Library".  Such a
work, in isolation, is not a derivative work of the Library, and
therefore falls outside the scope of this License.

  However, linking a "work that uses the Library" with the Library
creates an executable that is a derivative of the Library (because it
contains portions of the Library), rather than a "work that uses the
library".  The executable is therefore covered by this License.
Section 6 states terms for distribution of such executables.

  When a "work that uses the Library" uses material from a header file
that is part of the Library, the object code for the work may be a
derivative work of the Library even though the source code is not.
Whether this is true is especially significant if the work can be
linked without the Library, or if the work is itself a library.  The
threshold for this to be true is not precisely defined by law.

  If such an object file uses only numerical parameters, data
structure layouts and accessors, and small macros and small inline
functions (ten lines or less in length), then the use of the object
file is unrestricted, regardless of whether it is legally a derivative
work.  (Executables containing this object code plus portions of the
Library will still fall under Section 6.)

  Otherwise, if the work is a derivative of the Library, you may
distribute the object code for the work under the terms of Section 6.
Any executables containing that work also fall under Section 6,
whether or not they are linked directly with the Library itself.

  6. As an exception to the Sections above, you may also combine or
link a "work that uses the Library" with the Library to produce a
work containing portions of the Library, and distribute that work
under terms of your choice, provided that the terms permit
modification of the work for the customer's own use and reverse
engineering for debugging such modifications.

  You must give prominent notice with each copy of the work that the
Library is used in it and that the Library and its use are covered by
this License.  You must supply a copy of this License.  If the work
during execution displays copyright notices, you must include the
copyright notice for the Library among them, as well as a reference
directing the user to the copy of this License.  Also, you must do one
of these things:

    a) Accompany the work with the complete corresponding
    machine-readable source code for the Library including whatever
    changes were used in the work (which must be distributed under
    Sections 1 and 2 above); and, if the work is an executable linked
    with the Library, with the complete machine-readable "work that
    uses the Library", as object code and/or source code, so that the
    user can modify the Library and then relink to produce a modified
    executable containing the modified Library.  (It is understood
    that the user who changes the contents of definitions files in the
    Library will not necessarily be able to recompile the application
    to use the modified definitions.)

    b) Use a suitable shared library mechanism for linking with the
    Library.  A suitable mechanism is one that (1) uses at run time a
    copy of the library already present on the user's computer system,
    rather than copying library functions into the executable, and (2)
    will operate properly with a modified version of the library, if
    the user installs one, as long as the modified version is
    interface-compatible with the version that the work was made with.

    c) Accompany the work with a written offer, valid for at
    least three years, to give the same user the materials
```

```
    specified in Subsection 6a, above, for a charge no more
    than the cost of performing this distribution.

    d) If distribution of the work is made by offering access to copy
    from a designated place, offer equivalent access to copy the above
    specified materials from the same place.

    e) Verify that the user has already received a copy of these
    materials or that you have already sent this user a copy.

  For an executable, the required form of the "work that uses the
Library" must include any data and utility programs needed for
reproducing the executable from it.  However, as a special exception,
the materials to be distributed need not include anything that is
normally distributed (in either source or binary form) with the major
components (compiler, kernel, and so on) of the operating system on
which the executable runs, unless that component itself accompanies
the executable.

  It may happen that this requirement contradicts the license
restrictions of other proprietary libraries that do not normally
accompany the operating system.  Such a contradiction means you cannot
use both them and the Library together in an executable that you
distribute.

  7. You may place library facilities that are a work based on the
Library side-by-side in a single library together with other library
facilities not covered by this License, and distribute such a combined
library, provided that the separate distribution of the work based on
the Library and of the other library facilities is otherwise
permitted, and provided that you do these two things:

    a) Accompany the combined library with a copy of the same work
    based on the Library, uncombined with any other library
    facilities.  This must be distributed under the terms of the
    Sections above.

    b) Give prominent notice with the combined library of the fact
    that part of it is a work based on the Library, and explaining
    where to find the accompanying uncombined form of the same work.

  8. You may not copy, modify, sublicense, link with, or distribute
the Library except as expressly provided under this License.  Any
attempt otherwise to copy, modify, sublicense, link with, or
distribute the Library is void, and will automatically terminate your
rights under this License.  However, parties who have received copies,
or rights, from you under this License will not have their licenses
terminated so long as such parties remain in full compliance.

  9. You are not required to accept this License, since you have not
signed it.  However, nothing else grants you permission to modify or
distribute the Library or its derivative works.  These actions are
prohibited by law if you do not accept this License.  Therefore, by
modifying or distributing the Library (or any work based on the
Library), you indicate your acceptance of this License to do so, and
all its terms and conditions for copying, distributing or modifying
the Library or works based on it.

  10. Each time you redistribute the Library (or any work based on the
Library), the recipient automatically receives a license from the
original licensor to copy, distribute, link with or modify the Library
subject to these terms and conditions.  You may not impose any further
restrictions on the recipients' exercise of the rights granted herein.
You are not responsible for enforcing compliance by third parties with
this License.

  11. If, as a consequence of a court judgment or allegation of patent
infringement or for any other reason (not limited to patent issues),
conditions are imposed on you (whether by court order, agreement or
otherwise) that contradict the conditions of this License, they do not
excuse you from the conditions of this License.  If you cannot
distribute so as to satisfy simultaneously your obligations under this
License and any other pertinent obligations, then as a consequence you
may not distribute the Library at all.  For example, if a patent
license would not permit royalty-free redistribution of the Library by
all those who receive copies directly or indirectly through you, then
the only way you could satisfy both it and this License would be to
refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under
any particular circumstance, the balance of the section is intended
to apply, and the section as a whole is intended to apply in other
circumstances.

It is not the purpose of this section to induce you to infringe any
patents or other property right claims or to contest validity of any
such claims; this section has the sole purpose of protecting the
integrity of the free software distribution system which is
implemented by public license practices.  Many people have made
generous contributions to the wide range of software distributed
through that system in reliance on consistent application of that
system; it is up to the author/donor to decide if he or she is willing
to distribute software through any other system and a licensee cannot
impose that choice.

This section is intended to make thoroughly clear what is believed to
be a consequence of the rest of this License.
```

```
  12. If the distribution and/or use of the Library is restricted in
certain countries either by patents or by copyrighted interfaces, the
original copyright holder who places the Library under this License
may add an explicit geographical distribution limitation excluding
those countries, so that distribution is permitted only in or among
countries not thus excluded.  In such case, this License incorporates
the limitation as if written in the body of this License.

  13. The Free Software Foundation may publish revised and/or new
versions of the Lesser General Public License from time to time.
Such new versions will be similar in spirit to the present version,
but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number.  If the Library
specifies a version number of this License which applies to it and
"any later version", you have the option of following the terms and
conditions either of that version or of any later version published by
the Free Software Foundation.  If the Library does not specify a
license version number, you may choose any version ever published by
the Free Software Foundation.

  14. If you wish to incorporate parts of the Library into other free
programs whose distribution conditions are incompatible with these,
write to the author to ask for permission.  For software which is
copyrighted by the Free Software Foundation, write to the Free
Software Foundation; we sometimes make exceptions for this.  Our
decision will be guided by the two goals of preserving the free status
of all derivatives of our free software and of promoting the sharing
and reuse of software generally.

                            NO WARRANTY

  15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO
WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW.
EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR
OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY
KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE
IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR
PURPOSE.  THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE
LIBRARY IS WITH YOU.  SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME
THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

  16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN
WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY
AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU
FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR
CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE
LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING
RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A
FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF
SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH
DAMAGES.

                     END OF TERMS AND CONDITIONS

           How to Apply These Terms to Your New Libraries

  If you develop a new library, and you want it to be of the greatest
possible use to the public, we recommend making it free software that
everyone can redistribute and change.  You can do so by permitting
redistribution under these terms (or, alternatively, under the terms
of the ordinary General Public License).

  To apply these terms, attach the following notices to the library.
It is safest to attach them to the start of each source file to most
effectively convey the exclusion of warranty; and each file should
have at least the "copyright" line and a pointer to where the full
notice is found.

    <one line to give the library's name and a brief idea of what it does.>
    Copyright (C) <year>  <name of author>

    This library is free software; you can redistribute it and/or
    modify it under the terms of the GNU Lesser General Public
    License as published by the Free Software Foundation; either
    version 2.1 of the License, or (at your option) any later version.

    This library is distributed in the hope that it will be useful,
    but WITHOUT ANY WARRANTY; without even the implied warranty of
    MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE.  See the GNU
    Lesser General Public License for more details.

    You should have received a copy of the GNU Lesser General Public
    License along with this library; if not, write to the Free Software
    Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA
    02110-1301  USA

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your
school, if any, to sign a "copyright disclaimer" for the library, if
necessary.  Here is a sample; alter the names:

  Yoyodyne, Inc., hereby disclaims all copyright interest in the
  library `Frob' (a library for tweaking knobs) written by James
  Random Hacker.
```

  Ty Coon, President of Vice

That's all there is to it!
```

A.12. GNU Libtool License

The following software may be included in this product:

GNU Libtool (The GNU Portable Library Tool)

```
If you are receiving a copy of the Oracle software in
source code, you are also receiving a copy of two files
(ltmain.sh and ltdl.h) generated by the GNU Libtool in
source code. If you received the Oracle software under
a license other than a commercial (non-GPL) license,
then the terms of the Oracle license do NOT apply to
these files from GNU Libtool; they are licensed under
the following licenses, separately from the Oracle
programs you receive.

Oracle elects to use GNU General Public License version
2 (GPL) for any software where a choice of GPL or GNU
Lesser/Library General Public License (LGPL) license
versions are made available with the language indicating
that GPL/LGPL or any later version may be used, or where
a choice of which version of the GPL/LGPL is applied is
unspecified.

From GNU Libtool:

ltmain.sh - Provide generalized library-building support
services.
NOTE: Changing this file will not affect anything until
you rerun configure.

A.13. GNU Readline License

The following software may be included in this product:

GNU Readline Library

```
GNU Readline Library
With respect to MySQL Server/Cluster software licensed
under GNU General Public License, you are receiving a
copy of the GNU Readline Library in source code. The
terms of any Oracle license that might accompany the
Oracle programs do NOT apply to the GNU Readline Library;
it is licensed under the following license, separately
from the Oracle programs you receive. Oracle elects to
use GNU General Public License version 2 (GPL) for any
software where a choice of GPL license versions are
made available with the language indicating that GPLv2
or any later version may be used, or where a choice of
which version of the GPL is applied is unspecified.
```

This component is licensed under Section A.10, “GNU General Public License Version 2.0, June 1991”

A.14. Google Controlling Master Thread I/O Rate Patch License

                  GNU LESSER GENERAL PUBLIC LICENSE
                       Version 2.1, February 1999

 Copyright (C) 1991, 1999 Free Software Foundation, Inc.
 51 Franklin Street, Fifth Floor, Boston, MA  02110-1301  USA
 Everyone is permitted to copy and distribute verbatim copies
 of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL.  It also counts
```

```
 as the successor of the GNU Library Public License, version 2, hence
 the version number 2.1.]

                            Preamble

  The licenses for most software are designed to take away your
freedom to share and change it.  By contrast, the GNU General Public
Licenses are intended to guarantee your freedom to share and change
free software--to make sure the software is free for all its users.

  This license, the Lesser General Public License, applies to some
specially designated software packages--typically libraries--of the
Free Software Foundation and other authors who decide to use it.  You
can use it too, but we suggest you first think carefully about whether
this license or the ordinary General Public License is the better
strategy to use in any particular case, based on the explanations below.

  When we speak of free software, we are referring to freedom of use,
not price.  Our General Public Licenses are designed to make sure that
you have the freedom to distribute copies of free software (and charge
for this service if you wish); that you receive source code or can get
it if you want it; that you can change the software and use pieces of
it in new free programs; and that you are informed that you can do
these things.

  To protect your rights, we need to make restrictions that forbid
distributors to deny you these rights or to ask you to surrender these
rights.  These restrictions translate to certain responsibilities for
you if you distribute copies of the library or if you modify it.

  For example, if you distribute copies of the library, whether gratis
or for a fee, you must give the recipients all the rights that we gave
you.  You must make sure that they, too, receive or can get the source
code.  If you link other code with the library, you must provide
complete object files to the recipients, so that they can relink them
with the library after making changes to the library and recompiling
it.  And you must show them these terms so they know their rights.

  We protect your rights with a two-step method: (1) we copyright the
library, and (2) we offer you this license, which gives you legal
permission to copy, distribute and/or modify the library.

  To protect each distributor, we want to make it very clear that
there is no warranty for the free library.  Also, if the library is
modified by someone else and passed on, the recipients should know
that what they have is not the original version, so that the original
author's reputation will not be affected by problems that might be
introduced by others.

  Finally, software patents pose a constant threat to the existence of
any free program.  We wish to make sure that a company cannot
effectively restrict the users of a free program by obtaining a
restrictive license from a patent holder.  Therefore, we insist that
any patent license obtained for a version of the library must be
consistent with the full freedom of use specified in this license.

  Most GNU software, including some libraries, is covered by the
ordinary GNU General Public License.  This license, the GNU Lesser
General Public License, applies to certain designated libraries, and
is quite different from the ordinary General Public License.  We use
this license for certain libraries in order to permit linking those
libraries into non-free programs.

  When a program is linked with a library, whether statically or using
a shared library, the combination of the two is legally speaking a
combined work, a derivative of the original library.  The ordinary
General Public License therefore permits such linking only if the
entire combination fits its criteria of freedom.  The Lesser General
Public License permits more lax criteria for linking other code with
the library.

  We call this license the "Lesser" General Public License because it
does Less to protect the user's freedom than the ordinary General
Public License.  It also provides other free software developers Less
of an advantage over competing non-free programs.  These disadvantages
are the reason we use the ordinary General Public License for many
libraries.  However, the Lesser license provides advantages in certain
special circumstances.

  For example, on rare occasions, there may be a special need to
encourage the widest possible use of a certain library, so that it
becomes a de-facto standard.  To achieve this, non-free programs
must be allowed to use the library.  A more frequent case is that
a free library does the same job as widely used non-free libraries.
In this case, there is little to gain by limiting the free library
to free software only, so we use the Lesser General Public License.

  In other cases, permission to use a particular library in non-free
programs enables a greater number of people to use a large body of
free software.  For example, permission to use the GNU C Library in
non-free programs enables many more people to use the whole GNU
operating system, as well as its variant, the GNU/Linux operating
system.

  Although the Lesser General Public License is Less protective of the
users' freedom, it does ensure that the user of a program that is
linked with the Library has the freedom and the wherewithal to run
```

```
that program using a modified version of the Library.

  The precise terms and conditions for copying, distribution and
modification follow.  Pay close attention to the difference between a
"work based on the library" and a "work that uses the library".  The
former contains code derived from the library, whereas the latter must
be combined with the library in order to run.

                  GNU LESSER GENERAL PUBLIC LICENSE
   TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

  0. This License Agreement applies to any software library or other
program which contains a notice placed by the copyright holder or
other authorized party saying it may be distributed under the terms of
this Lesser General Public License (also called "this License").
Each licensee is addressed as "you".

  A "library" means a collection of software functions and/or data
prepared so as to be conveniently linked with application programs
(which use some of those functions and data) to form executables.

  The "Library", below, refers to any such software library or work
which has been distributed under these terms.  A "work based on the
Library" means either the Library or any derivative work under
copyright law: that is to say, a work containing the Library or a
portion of it, either verbatim or with modifications and/or translated
straightforwardly into another language.  (Hereinafter, translation is
included without limitation in the term "modification".)

  "Source code" for a work means the preferred form of the work for
making modifications to it.  For a library, complete source code means
all the source code for all modules it contains, plus any associated
interface definition files, plus the scripts used to control
compilation and installation of the library.

  Activities other than copying, distribution and modification are not
covered by this License; they are outside its scope.  The act of
running a program using the Library is not restricted, and output from
such a program is covered only if its contents constitute a work based
on the Library (independent of the use of the Library in a tool for
writing it).  Whether that is true depends on what the Library does
and what the program that uses the Library does.

  1. You may copy and distribute verbatim copies of the Library's
complete source code as you receive it, in any medium, provided that
you conspicuously and appropriately publish on each copy an
appropriate copyright notice and disclaimer of warranty; keep intact
all the notices that refer to this License and to the absence of any
warranty; and distribute a copy of this License along with the
Library.

  You may charge a fee for the physical act of transferring a copy,
and you may at your option offer warranty protection in exchange for a
fee.

  2. You may modify your copy or copies of the Library or any portion
of it, thus forming a work based on the Library, and copy and
distribute such modifications or work under the terms of Section 1
above, provided that you also meet all of these conditions:

    a) The modified work must itself be a software library.

    b) You must cause the files modified to carry prominent notices
    stating that you changed the files and the date of any change.

    c) You must cause the whole of the work to be licensed at no
    charge to all third parties under the terms of this License.

    d) If a facility in the modified Library refers to a function or a
    table of data to be supplied by an application program that uses
    the facility, other than as an argument passed when the facility
    is invoked, then you must make a good faith effort to ensure that,
    in the event an application does not supply such function or
    table, the facility still operates, and performs whatever part of
    its purpose remains meaningful.

    (For example, a function in a library to compute square roots has
    a purpose that is entirely well-defined independent of the
    application.  Therefore, Subsection 2d requires that any
    application-supplied function or table used by this function must
    be optional: if the application does not supply it, the square
    root function must still compute square roots.)

These requirements apply to the modified work as a whole.  If
identifiable sections of that work are not derived from the Library,
and can be reasonably considered independent and separate works in
themselves, then this License, and its terms, do not apply to those
sections when you distribute them as separate works.  But when you
distribute the same sections as part of a whole which is a work based
on the Library, the distribution of the whole must be on the terms of
this License, whose permissions for other licensees extend to the
entire whole, and thus to each and every part regardless of who wrote
it.

Thus, it is not the intent of this section to claim rights or contest
your rights to work written entirely by you; rather, the intent is to
exercise the right to control the distribution of derivative or
```

```
collective works based on the Library.

In addition, mere aggregation of another work not based on the Library
with the Library (or with a work based on the Library) on a volume of
a storage or distribution medium does not bring the other work under
the scope of this License.

  3. You may opt to apply the terms of the ordinary GNU General Public
License instead of this License to a given copy of the Library.  To do
this, you must alter all the notices that refer to this License, so
that they refer to the ordinary GNU General Public License, version 2,
instead of to this License.  (If a newer version than version 2 of the
ordinary GNU General Public License has appeared, then you can specify
that version instead if you wish.)  Do not make any other change in
these notices.

  Once this change is made in a given copy, it is irreversible for
that copy, so the ordinary GNU General Public License applies to all
subsequent copies and derivative works made from that copy.

  This option is useful when you wish to copy part of the code of
the Library into a program that is not a library.

  4. You may copy and distribute the Library (or a portion or
derivative of it, under Section 2) in object code or executable form
under the terms of Sections 1 and 2 above provided that you accompany
it with the complete corresponding machine-readable source code, which
must be distributed under the terms of Sections 1 and 2 above on a
medium customarily used for software interchange.

  If distribution of object code is made by offering access to copy
from a designated place, then offering equivalent access to copy the
source code from the same place satisfies the requirement to
distribute the source code, even though third parties are not
compelled to copy the source along with the object code.

  5. A program that contains no derivative of any portion of the
Library, but is designed to work with the Library by being compiled or
linked with it, is called a "work that uses the Library".  Such a
work, in isolation, is not a derivative work of the Library, and
therefore falls outside the scope of this License.

  However, linking a "work that uses the Library" with the Library
creates an executable that is a derivative of the Library (because it
contains portions of the Library), rather than a "work that uses the
library".  The executable is therefore covered by this License.
Section 6 states terms for distribution of such executables.

  When a "work that uses the Library" uses material from a header file
that is part of the Library, the object code for the work may be a
derivative work of the Library even though the source code is not.
Whether this is true is especially significant if the work can be
linked without the Library, or if the work is itself a library.  The
threshold for this to be true is not precisely defined by law.

  If such an object file uses only numerical parameters, data
structure layouts and accessors, and small macros and small inline
functions (ten lines or less in length), then the use of the object
file is unrestricted, regardless of whether it is legally a derivative
work.  (Executables containing this object code plus portions of the
Library will still fall under Section 6.)

  Otherwise, if the work is a derivative of the Library, you may
distribute the object code for the work under the terms of Section 6.
Any executables containing that work also fall under Section 6,
whether or not they are linked directly with the Library itself.

  6. As an exception to the Sections above, you may also combine or
link a "work that uses the Library" with the Library to produce a
work containing portions of the Library, and distribute that work
under terms of your choice, provided that the terms permit
modification of the work for the customer's own use and reverse
engineering for debugging such modifications.

  You must give prominent notice with each copy of the work that the
Library is used in it and that the Library and its use are covered by
this License.  You must supply a copy of this License.  If the work
during execution displays copyright notices, you must include the
copyright notice for the Library among them, as well as a reference
directing the user to the copy of this License.  Also, you must do one
of these things:

    a) Accompany the work with the complete corresponding
    machine-readable source code for the Library including whatever
    changes were used in the work (which must be distributed under
    Sections 1 and 2 above); and, if the work is an executable linked
    with the Library, with the complete machine-readable "work that
    uses the Library", as object code and/or source code, so that the
    user can modify the Library and then relink to produce a modified
    executable containing the modified Library.  (It is understood
    that the user who changes the contents of definitions files in the
    Library will not necessarily be able to recompile the application
    to use the modified definitions.)

    b) Use a suitable shared library mechanism for linking with the
    Library.  A suitable mechanism is one that (1) uses at run time a
    copy of the library already present on the user's computer system,
```

```
    rather than copying library functions into the executable, and (2)
    will operate properly with a modified version of the library, if
    the user installs one, as long as the modified version is
    interface-compatible with the version that the work was made with.

    c) Accompany the work with a written offer, valid for at
    least three years, to give the same user the materials
    specified in Subsection 6a, above, for a charge no more
    than the cost of performing this distribution.

    d) If distribution of the work is made by offering access to copy
    from a designated place, offer equivalent access to copy the above
    specified materials from the same place.

    e) Verify that the user has already received a copy of these
    materials or that you have already sent this user a copy.

  For an executable, the required form of the "work that uses the
Library" must include any data and utility programs needed for
reproducing the executable from it.  However, as a special exception,
the materials to be distributed need not include anything that is
normally distributed (in either source or binary form) with the major
components (compiler, kernel, and so on) of the operating system on
which the executable runs, unless that component itself accompanies
the executable.

  It may happen that this requirement contradicts the license
restrictions of other proprietary libraries that do not normally
accompany the operating system.  Such a contradiction means you cannot
use both them and the Library together in an executable that you
distribute.

  7. You may place library facilities that are a work based on the
Library side-by-side in a single library together with other library
facilities not covered by this License, and distribute such a combined
library, provided that the separate distribution of the work based on
the Library and of the other library facilities is otherwise
permitted, and provided that you do these two things:

    a) Accompany the combined library with a copy of the same work
    based on the Library, uncombined with any other library
    facilities.  This must be distributed under the terms of the
    Sections above.

    b) Give prominent notice with the combined library of the fact
    that part of it is a work based on the Library, and explaining
    where to find the accompanying uncombined form of the same work.

  8. You may not copy, modify, sublicense, link with, or distribute
the Library except as expressly provided under this License.  Any
attempt otherwise to copy, modify, sublicense, link with, or
distribute the Library is void, and will automatically terminate your
rights under this License.  However, parties who have received copies,
or rights, from you under this License will not have their licenses
terminated so long as such parties remain in full compliance.

  9. You are not required to accept this License, since you have not
signed it.  However, nothing else grants you permission to modify or
distribute the Library or its derivative works.  These actions are
prohibited by law if you do not accept this License.  Therefore, by
modifying or distributing the Library (or any work based on the
Library), you indicate your acceptance of this License to do so, and
all its terms and conditions for copying, distributing or modifying
the Library or works based on it.

  10. Each time you redistribute the Library (or any work based on the
Library), the recipient automatically receives a license from the
original licensor to copy, distribute, link with or modify the Library
subject to these terms and conditions.  You may not impose any further
restrictions on the recipients' exercise of the rights granted herein.
You are not responsible for enforcing compliance by third parties with
this License.

  11. If, as a consequence of a court judgment or allegation of patent
infringement or for any other reason (not limited to patent issues),
conditions are imposed on you (whether by court order, agreement or
otherwise) that contradict the conditions of this License, they do not
excuse you from the conditions of this License.  If you cannot
distribute so as to satisfy simultaneously your obligations under this
License and any other pertinent obligations, then as a consequence you
may not distribute the Library at all.  For example, if a patent
license would not permit royalty-free redistribution of the Library by
all those who receive copies directly or indirectly through you, then
the only way you could satisfy both it and this License would be to
refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under
any particular circumstance, the balance of the section is intended
to apply, and the section as a whole is intended to apply in other
circumstances.

It is not the purpose of this section to induce you to infringe any
patents or other property right claims or to contest validity of any
such claims; this section has the sole purpose of protecting the
integrity of the free software distribution system which is
implemented by public license practices.  Many people have made
generous contributions to the wide range of software distributed
```

```
through that system in reliance on consistent application of that
system; it is up to the author/donor to decide if he or she is willing
to distribute software through any other system and a licensee cannot
impose that choice.

This section is intended to make thoroughly clear what is believed to
be a consequence of the rest of this License.

  12. If the distribution and/or use of the Library is restricted in
certain countries either by patents or by copyrighted interfaces, the
original copyright holder who places the Library under this License
may add an explicit geographical distribution limitation excluding
those countries, so that distribution is permitted only in or among
countries not thus excluded.  In such case, this License incorporates
the limitation as if written in the body of this License.

  13. The Free Software Foundation may publish revised and/or new
versions of the Lesser General Public License from time to time.
Such new versions will be similar in spirit to the present version,
but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number.  If the Library
specifies a version number of this License which applies to it and
"any later version", you have the option of following the terms and
conditions either of that version or of any later version published by
the Free Software Foundation.  If the Library does not specify a
license version number, you may choose any version ever published by
the Free Software Foundation.

  14. If you wish to incorporate parts of the Library into other free
programs whose distribution conditions are incompatible with these,
write to the author to ask for permission.  For software which is
copyrighted by the Free Software Foundation, write to the Free
Software Foundation; we sometimes make exceptions for this.  Our
decision will be guided by the two goals of preserving the free status
of all derivatives of our free software and of promoting the sharing
and reuse of software generally.

                            NO WARRANTY

  15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO
WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW.
EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR
OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY
KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE
IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR
PURPOSE.  THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE
LIBRARY IS WITH YOU.  SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME
THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

  16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN
WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY
AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU
FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR
CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE
LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING
RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A
FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF
SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH
DAMAGES.

                     END OF TERMS AND CONDITIONS

           How to Apply These Terms to Your New Libraries

  If you develop a new library, and you want it to be of the greatest
possible use to the public, we recommend making it free software that
everyone can redistribute and change.  You can do so by permitting
redistribution under these terms (or, alternatively, under the terms
of the ordinary General Public License).

  To apply these terms, attach the following notices to the library.
It is safest to attach them to the start of each source file to most
effectively convey the exclusion of warranty; and each file should
have at least the "copyright" line and a pointer to where the full
notice is found.

    <one line to give the library's name and a brief idea of what it does.>
    Copyright (C) <year>  <name of author>

    This library is free software; you can redistribute it and/or
    modify it under the terms of the GNU Lesser General Public
    License as published by the Free Software Foundation; either
    version 2.1 of the License, or (at your option) any later version.

    This library is distributed in the hope that it will be useful,
    but WITHOUT ANY WARRANTY; without even the implied warranty of
    MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE.  See the GNU
    Lesser General Public License for more details.

    You should have received a copy of the GNU Lesser General Public
    License along with this library; if not, write to the Free Software
    Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA
    02110-1301  USA

Also add information on how to contact you by electronic and paper mail.
```

```
You should also get your employer (if you work as a programmer) or your
school, if any, to sign a "copyright disclaimer" for the library, if
necessary.  Here is a sample; alter the names:

  Yoyodyne, Inc., hereby disclaims all copyright interest in the
  library `Frob' (a library for tweaking knobs) written by James
  Random Hacker.

  <signature of Ty Coon>, 1 April 1990
  Ty Coon, President of Vice

That's all there is to it!
```

A.22. Linux-PAM License

The following software may be included in this product:

```
Linux-PAM (pam-devel, Pluggable authentication modules for Linux)

Copyright Theodore Ts'o, 1996. All rights reserved.

(For the avoidance of doubt, Oracle uses and distributes this
component under the terms below and elects not to do so under
the GPL even though the GPL is referenced as an option below.)

Redistribution and use in source and binary forms, with or
without modification, are permitted provided that the following
conditions are met:

1. Redistributions of source code must retain the above copyright
   notice, and the entire permission notice in its entirety,
   including the disclaimer of warranties.
2. Redistributions in binary form must reproduce the above copyright
   notice, this list of conditions and the following disclaimer in
   the documentation and/or other materials provided with the
   distribution.
3. The name of the author may not be used to endorse or promote
   products derived from this software without specific prior
   written permission.

ALTERNATIVELY, this product may be distributed under the terms
of the GNU Public License, in which case the provisions of the
GPL are required INSTEAD OF the above restrictions. (This clause
is necessary due to a potential bad interaction between the GPL
and the restrictions contained in a BSD-style copyright.)

WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.
```

A.26. md5 (Message-Digest Algorithm 5) License

The following software may be included in this product:

```
md5 (Message-Digest Algorithm 5)

 This code implements the MD5 message-digest algorithm.
 The algorithm is due to Ron Rivest.  This code was
 written by Colin Plumb in 1993, no copyright is claimed.
 This code is in the public domain; do with it what you wish.

 Equivalent code is available from RSA Data Security, Inc.
 This code has been tested against that, and is equivalent,
 except that you don't need to include two pages of legalese
 with every copy.

 The code has been modified by Mikael Ronstroem to handle
 calculating a hash value of a key that is always a multiple
 of 4 bytes long. Word 0 of the calculated 4-word hash value
 is returned as the hash value.
```

A.27. nt_servc (Windows NT Service class library) License

The following software may be included in this product:

nt_servc (Windows NT Service class library)

```
Windows NT Service class library
Copyright Abandoned 1998 Irena Pancirov - Irnet Snc

A.29. PCRE License

The following software may be included in this product:

PCRE (Perl Compatible Regular Expressions) Library

```
PCRE LICENCE

PCRE is a library of functions to support regular expressions
whose syntax and semantics are as close as possible to those
of the Perl 5 language.

Release 7 of PCRE is distributed under the terms of the "BSD"
licence, as specified below. The documentation for PCRE,
supplied in the "doc" directory, is distributed under the same
terms as the software itself.

The basic library functions are written in C and are
freestanding. Also included in the distribution is a set
of C++ wrapper functions.

B.14.10. DRBD and Support and Consulting 2911

B.1. MySQL 5.5 FAQ: General

Questions

- B.1.1: Which version of MySQL is production-ready (GA)?
- B.1.2: What is the state of development (non-GA) versions?
- B.1.3: Can MySQL 5.5 do subqueries?
- B.1.4: Can MySQL 5.5 perform multiple-table inserts, updates, and deletes?
- B.1.5: Does MySQL 5.5 have a Query Cache? Does it work on Server, Instance or Database?
- B.1.6: Does MySQL 5.5 have Sequences?
- B.1.7: Does MySQL 5.5 have a `NOW()` function with fractions of seconds?
- B.1.8: Does MySQL 5.5 work with multi-core processors?
- B.1.9: Why do I see multiple processes for `mysqld`?
- B.1.10: Have there been there any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?
- B.1.11: Can MySQL 5.5 perform ACID transactions?

Questions and Answers

B.1.1: Which version of MySQL is production-ready (GA)?

At the time of writing this (December 2011), MySQL 5.5, MySQL 5.1, and MySQL 5.0 are supported for production use.

MySQL 5.5 achieved General Availability (GA) status with MySQL 5.5.8, which was released for production use on 3 December

2010.

MySQL 5.1 achieved General Availability (GA) status with MySQL 5.1.30, which was released for production use on 14 November 2008.

MySQL 5.0 achieved General Availability (GA) status with MySQL 5.0.15, which was released for production use on 19 October 2005. Note that active development for MySQL 5.0 has ended.

B.1.2: What is the state of development (non-GA) versions?

MySQL follows a milestone release model that introduces pre-production-quality features and stabilizes them to release quality (see http://forge.mysql.com/wiki/Development_Cycle). This process then repeats, so releases cycle between pre-production and release quality status. Please check the change logs to identify the status of a given release.

MySQL 5.4 was a development series. Work on this series has ceased.

MySQL 5.5 is being actively developed using the milestone release methodology described above.

MySQL 5.6 is being actively developed using the milestone release methodology described above.

MySQL 6.0 was a development series. Work on this series has ceased.

B.1.3: Can MySQL 5.5 do subqueries?

Yes. See Section 12.2.10, “Subquery Syntax”.

B.1.4: Can MySQL 5.5 perform multiple-table inserts, updates, and deletes?

Yes. For the syntax required to perform multiple-table updates, see Section 12.2.11, “`UPDATE` Syntax”; for that required to perform multiple-table deletes, see Section 12.2.2, “`DELETE` Syntax”.

A multiple-table insert can be accomplished using a trigger whose `FOR EACH ROW` clause contains multiple `INSERT` statements within a `BEGIN ... END` block. See Section 18.3, “Using Triggers”.

B.1.5: Does MySQL 5.5 have a Query Cache? Does it work on Server, Instance or Database?

Yes. The query cache operates on the server level, caching complete result sets matched with the original query string. If an exactly identical query is made (which often happens, particularly in web applications), no parsing or execution is necessary; the result is sent directly from the cache. Various tuning options are available. See Section 7.9.3, “The MySQL Query Cache”.

B.1.6: Does MySQL 5.5 have Sequences?

No. However, MySQL has an `AUTO_INCREMENT` system, which in MySQL 5.5 can also handle inserts in a multi-master replication setup. With the `auto_increment_increment` and `auto_increment_offset` system variables, you can set each server to generate auto-increment values that don't conflict with other servers. The `auto_increment_increment` value should be greater than the number of servers, and each server should have a unique offset.

B.1.7: Does MySQL 5.5 have a `NOW()` function with fractions of seconds?

No. This is on the MySQL roadmap as a “rolling feature”. This means that it is not a flagship feature, but will be implemented, development time permitting. Specific customer demand may change this scheduling.

However, MySQL does parse time strings with a fractional component. See Section 10.3.2, “The `TIME` Type”.

B.1.8: Does MySQL 5.5 work with multi-core processors?

Yes. MySQL is fully multi-threaded, and will make use of multiple CPUs, provided that the operating system supports them.

B.1.9: Why do I see multiple processes for `mysqld`?

When using LinuxThreads, you should see a minimum of three `mysqld` processes running. These are in fact threads. There is one thread for the LinuxThreads manager, one thread to handle connections, and one thread to handle alarms and signals.

B.1.10: Have there been there any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?

The foreign key support in `InnoDB` has seen improvements in each major version of MySQL. Foreign key support generic to all storage engines is scheduled for MySQL 6.x; this should resolve any inadequacies in the current storage engine specific implementation.

B.1.11: Can MySQL 5.5 perform ACID transactions?

Yes. All current MySQL versions support transactions. The `InnoDB` storage engine offers full ACID transactions with row-level locking, multi-versioning, nonlocking repeatable reads, and all four SQL standard isolation levels.

The `NDB` storage engine supports the `READ COMMITTED` transaction isolation level only.

B.2. MySQL 5.5 FAQ: Storage Engines

Questions

- B.2.1: Where can I obtain complete documentation for MySQL storage engines?
- B.2.2: Are there any new storage engines in MySQL 5.5?
- B.2.3: Have any storage engines been removed in MySQL 5.5?
- B.2.4: What are the unique benefits of the `ARCHIVE` storage engine?
- B.2.5: Do the new features in MySQL 5.5 apply to all storage engines?

Questions and Answers

B.2.1: Where can I obtain complete documentation for MySQL storage engines?

See Chapter 13, *Storage Engines*. That chapter contains information about all MySQL storage engines except for the `NDB` storage engine used for MySQL Cluster; `NDB` is covered in Chapter 16, *MySQL Cluster NDB 7.2*.

B.2.2: Are there any new storage engines in MySQL 5.5?

The features from the optional `InnoDB Plugin` from MySQL 5.1 are folded into the built-in `InnoDB` storage engine, so you can take advantage of features such as the Barracuda file format, `InnoDB` table compression, and the new configuration options for performance. See Section 13.4, “New Features of InnoDB 1.1” for details. `InnoDB` also becomes the default storage engine for new tables. See Section 13.3.1, “InnoDB as the Default MySQL Storage Engine” for details.

B.2.3: Have any storage engines been removed in MySQL 5.5?

No.

B.2.4: What are the unique benefits of the `ARCHIVE` storage engine?

The `ARCHIVE` storage engine is ideally suited for storing large amounts of data without indexes; it has a very small footprint, and performs selects using table scans. See Section 13.8, “The ARCHIVE Storage Engine”, for details.

B.2.5: Do the new features in MySQL 5.5 apply to all storage engines?

The general new features such as views, stored procedures, triggers, `INFORMATION_SCHEMA`, precision math (`DECIMAL` column type), and the `BIT` column type, apply to all storage engines. There are also additions and changes for specific storage engines.

B.3. MySQL 5.5 FAQ: Server SQL Mode

Questions

- B.3.1: What are server SQL modes?
- B.3.2: How many server SQL modes are there?
- B.3.3: How do you determine the server SQL mode?
- B.3.4: Is the mode dependent on the database or connection?
- B.3.5: Can the rules for strict mode be extended?
- B.3.6: Does strict mode impact performance?
- B.3.7: What is the default server SQL mode when My SQL 5.5 is installed?

Questions and Answers

B.3.1: What are server SQL modes?

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server apply these modes individually to different clients. For more information, see Section 5.1.6, “Server SQL Modes”.

B.3.2: How many server SQL modes are there?

Each mode can be independently switched on and off. See Section 5.1.6, “Server SQL Modes”, for a complete list of available modes.

B.3.3: How do you determine the server SQL mode?

You can set the default SQL mode (for `mysqld` startup) with the `--sql-mode` option. Using the statement `SET [GLOBAL|SESSION] sql_mode='modes'`, you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a `SELECT @@sql_mode` statement.

B.3.4: Is the mode dependent on the database or connection?

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. you can change these settings using `SET [GLOBAL|SESSION] sql_mode='modes'`.

B.3.5: Can the rules for strict mode be extended?

When we refer to *strict mode*, we mean a mode where at least one of the modes `TRADITIONAL`, `STRICT_TRANS_TABLES`, or `STRICT_ALL_TABLES` is enabled. Options can be combined, so you can add restrictions to a mode. See Section 5.1.6, “Server SQL Modes”, for more information.

B.3.6: Does strict mode impact performance?

The intensive validation of input data that some settings requires more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However—if you do require it—strict mode can provide such validation.

B.3.7: What is the default server SQL mode when My SQL 5.5 is installed?

By default, no special modes are enabled. See Section 5.1.6, “Server SQL Modes”, for information about all available modes and MySQL's default behavior.

B.4. MySQL 5.5 FAQ: Stored Procedures and Functions

Questions

- B.4.1: Does MySQL 5.5 support stored procedures and functions?
- B.4.2: Where can I find documentation for MySQL stored procedures and stored functions?
- B.4.3: Is there a discussion forum for MySQL stored procedures?
- B.4.4: Where can I find the ANSI SQL 2003 specification for stored procedures?
- B.4.5: How do you manage stored routines?
- B.4.6: Is there a way to view all stored procedures and stored functions in a given database?
- B.4.7: Where are stored procedures stored?
- B.4.8: Is it possible to group stored procedures or stored functions into packages?
- B.4.9: Can a stored procedure call another stored procedure?
- B.4.10: Can a stored procedure call a trigger?
- B.4.11: Can a stored procedure access tables?
- B.4.12: Do stored procedures have a statement for raising application errors?
- B.4.13: Do stored procedures provide exception handling?

- B.4.14: Can MySQL 5.5 stored routines return result sets?
- B.4.15: Is `WITH RECOMPILE` supported for stored procedures?
- B.4.16: Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?
- B.4.17: Can I pass an array as input to a stored procedure?
- B.4.18: Can I pass a cursor as an `IN` parameter to a stored procedure?
- B.4.19: Can I return a cursor as an `OUT` parameter from a stored procedure?
- B.4.20: Can I print out a variable's value within a stored routine for debugging purposes?
- B.4.21: Can I commit or roll back transactions inside a stored procedure?
- B.4.22: Do MySQL 5.5 stored procedures and functions work with replication?
- B.4.23: Are stored procedures and functions created on a master server replicated to a slave?
- B.4.24: How are actions that take place inside stored procedures and functions replicated?
- B.4.25: Are there special security requirements for using stored procedures and functions together with replication?
- B.4.26: What limitations exist for replicating stored procedure and function actions?
- B.4.27: Do the preceding limitations affect MySQL's ability to do point-in-time recovery?
- B.4.28: What is being done to correct the aforementioned limitations?

Questions and Answers

B.4.1: Does MySQL 5.5 support stored procedures and functions?

Yes. MySQL 5.5 supports two types of stored routines—stored procedures and stored functions.

B.4.2: Where can I find documentation for MySQL stored procedures and stored functions?

See Section 18.2, “Using Stored Routines (Procedures and Functions)”.

B.4.3: Is there a discussion forum for MySQL stored procedures?

Yes. See http://forums.mysql.com/list.php?98.

B.4.4: Where can I find the ANSI SQL 2003 specification for stored procedures?

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books—such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer—which give a comprehensive overview of the standard, including coverage of stored procedures.

B.4.5: How do you manage stored routines?

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with `CREATE [FUNCTION|PROCEDURE]`, `ALTER [FUNCTION|PROCEDURE]`, `DROP [FUNCTION|PROCEDURE]`, and `SHOW CREATE [FUNCTION|PROCEDURE]`. You can obtain information about existing stored procedures using the `ROUTINES` table in the `INFORMATION_SCHEMA` database (see Section 19.18, “The `INFORMATION_SCHEMA ROUTINES` Table”).

B.4.6: Is there a way to view all stored procedures and stored functions in a given database?

Yes. For a database named *`dbname`*, use this query on the `INFORMATION_SCHEMA.ROUTINES` table:

```
SELECT ROUTINE_TYPE, ROUTINE_NAME
    FROM INFORMATION_SCHEMA.ROUTINES
    WHERE ROUTINE_SCHEMA='dbname';
```

For more information, see Section 19.18, “The `INFORMATION_SCHEMA ROUTINES` Table”.

The body of a stored routine can be viewed using `SHOW CREATE FUNCTION` (for a stored function) or `SHOW CREATE PROCEDURE` (for a stored procedure). See Section 12.7.5.11, “`SHOW CREATE PROCEDURE` Syntax”, for more information.

B.4.7: Where are stored procedures stored?

In the `proc` table of the `mysql` system database. However, you should not access the tables in the system database directly. Instead, use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See Section 12.7.5.11, "`SHOW CREATE PROCEDURE` Syntax", for more information about these statements.

You can also query the `ROUTINES` table in the `INFORMATION_SCHEMA` database—see Section 19.18, "The `INFORMATION_SCHEMA ROUTINES` Table", for information about this table.

B.4.8: Is it possible to group stored procedures or stored functions into packages?

No. This is not supported in MySQL 5.5.

B.4.9: Can a stored procedure call another stored procedure?

Yes.

B.4.10: Can a stored procedure call a trigger?

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to activate.

B.4.11: Can a stored procedure access tables?

Yes. A stored procedure can access one or more tables as required.

B.4.12: Do stored procedures have a statement for raising application errors?

Yes. MySQL 5.5 implements the SQL standard `SIGNAL` and `RESIGNAL` statements. See Section 12.6.7, "Condition Handling".

B.4.13: Do stored procedures provide exception handling?

MySQL implements `HANDLER` definitions according to the SQL standard. See Section 12.6.7.2, "`DECLARE ... HANDLER` Syntax", for details.

B.4.14: Can MySQL 5.5 stored routines return result sets?

Stored procedures can, but stored functions cannot. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or above) client/server protocol for this to work. This means that—for instance—in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

B.4.15: Is `WITH RECOMPILE` supported for stored procedures?

Not in MySQL 5.5.

B.4.16: Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?

There is no equivalent in MySQL 5.5.

B.4.17: Can I pass an array as input to a stored procedure?

Not in MySQL 5.5.

B.4.18: Can I pass a cursor as an `IN` parameter to a stored procedure?

In MySQL 5.5, cursors are available inside stored procedures only.

B.4.19: Can I return a cursor as an `OUT` parameter from a stored procedure?

In MySQL 5.5, cursors are available inside stored procedures only. However, if you do not open a cursor on a `SELECT`, the result will be sent directly to the client. You can also `SELECT INTO` variables. See Section 12.2.9, "`SELECT` Syntax".

B.4.20: Can I print out a variable's value within a stored routine for debugging purposes?

Yes, you can do this in a *stored procedure*, but not in a stored function. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You will need to use the MySQL 4.1 (or above) client/server protocol for this to work. This means that—for instance—in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

B.4.21: Can I commit or roll back transactions inside a stored procedure?

Yes. However, you cannot perform transactional operations within a stored function.

B.4.22: Do MySQL 5.5 stored procedures and functions work with replication?

Yes, standard actions carried out in stored procedures and functions are replicated from a master MySQL server to a slave server. There are a few limitations that are described in detail in Section 18.7, “Binary Logging of Stored Programs”.

B.4.23: Are stored procedures and functions created on a master server replicated to a slave?

Yes, creation of stored procedures and functions carried out through normal DDL statements on a master server are replicated to a slave, so the objects will exist on both servers. `ALTER` and `DROP` statements for stored procedures and functions are also replicated.

B.4.24: How are actions that take place inside stored procedures and functions replicated?

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a slave server. The actual calls made to execute stored procedures are not replicated.

Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

B.4.25: Are there special security requirements for using stored procedures and functions together with replication?

Yes. Because a slave server has authority to execute any statement read from a master's binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active, then MySQL DBAs have two security options open to them:

1. Any user wishing to create stored functions must be granted the `SUPER` privilege.
2. Alternatively, a DBA can set the `log_bin_trust_function_creators` system variable to 1, which enables anyone with the standard `CREATE ROUTINE` privilege to create stored functions.

B.4.26: What limitations exist for replicating stored procedure and function actions?

Nondeterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced, and therefore, random actions replicated to a slave will not mirror those performed on a master. Note that declaring stored functions to be `DETERMINISTIC` or setting the `log_bin_trust_function_creators` system variable to 0 will not allow random-valued operations to be invoked.

In addition, time-based actions cannot be reproduced on a slave because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, nontransactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a master may be partially updated from DML activity, but no updates are done to the slave because of the errors that occurred. A workaround is for a function's DML actions to be carried out with the `IGNORE` keyword so that updates on the master that cause errors are ignored and updates that do not cause errors are replicated to the slave.

B.4.27: Do the preceding limitations affect MySQL's ability to do point-in-time recovery?

The same limitations that affect replication do affect point-in-time recovery.

B.4.28: What is being done to correct the aforementioned limitations?

You can choose either statement-based replication or row-based replication. The original replication implementation is based on statement-based binary logging. Row-based binary logging resolves the limitations mentioned earlier.

Mixed replication is also available (by starting the server with `--binlog-format=mixed`). This hybrid, “smart” form of replication “knows” whether statement-level replication can safely be used, or row-level replication is required.

For additional information, see Section 15.1.2, “Replication Formats”.

B.5. MySQL 5.5 FAQ: Triggers

Questions

- B.5.1: Where can I find the documentation for MySQL 5.5 triggers?
- B.5.2: Is there a discussion forum for MySQL Triggers?
- B.5.3: Does MySQL 5.5 have statement-level or row-level triggers?
- B.5.4: Are there any default triggers?

- B.5.5: How are triggers managed in MySQL?
- B.5.6: Is there a way to view all triggers in a given database?
- B.5.7: Where are triggers stored?
- B.5.8: Can a trigger call a stored procedure?
- B.5.9: Can triggers access tables?
- B.5.10: Can triggers call an external application through a UDF?
- B.5.11: Is it possible for a trigger to update tables on a remote server?
- B.5.12: Do triggers work with replication?
- B.5.13: How are actions carried out through triggers on a master replicated to a slave?

Questions and Answers

B.5.1: Where can I find the documentation for MySQL 5.5 triggers?

See Section 18.3, “Using Triggers”.

B.5.2: Is there a discussion forum for MySQL Triggers?

Yes. It is available at http://forums.mysql.com/list.php?99.

B.5.3: Does MySQL 5.5 have statement-level or row-level triggers?

In MySQL 5.5, all triggers are `FOR EACH ROW`—that is, the trigger is activated for each row that is inserted, updated, or deleted. MySQL 5.5 does not support triggers using `FOR EACH STATEMENT`.

B.5.4: Are there any default triggers?

Not explicitly. MySQL does have specific special behavior for some `TIMESTAMP` columns, as well as for columns which are defined using `AUTO_INCREMENT`.

B.5.5: How are triggers managed in MySQL?

In MySQL 5.5, triggers can be created using the `CREATE TRIGGER` statement, and dropped using `DROP TRIGGER`. See Section 12.1.19, “`CREATE TRIGGER` Syntax”, and Section 12.1.30, “`DROP TRIGGER` Syntax”, for more about these statements.

Information about triggers can be obtained by querying the `INFORMATION_SCHEMA.TRIGGERS` table. See Section 19.26, “The `INFORMATION_SCHEMA TRIGGERS` Table”.

B.5.6: Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database `dbname` using a query on the `INFORMATION_SCHEMA.TRIGGERS` table such as the one shown here:

```
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
    FROM INFORMATION_SCHEMA.TRIGGERS
    WHERE TRIGGER_SCHEMA='dbname';
```

For more information about this table, see Section 19.26, “The `INFORMATION_SCHEMA TRIGGERS` Table”.

You can also use the `SHOW TRIGGERS` statement, which is specific to MySQL. See Section 12.7.5.39, “`SHOW TRIGGERS` Syntax”.

B.5.7: Where are triggers stored?

Triggers for a table are currently stored in `.TRG` files, with one such file one per table.

B.5.8: Can a trigger call a stored procedure?

Yes.

B.5.9: Can triggers access tables?

A trigger can access both old and new data in its own table. A trigger can also affect other tables, but it is not permitted to modify a

table that is already being used (for reading or writing) by the statement that invoked the function or trigger.

B.5.10: Can triggers call an external application through a UDF?

Yes. For example, a trigger could invoke the `sys_exec()` UDF available at MySQL Forge here: http://forge.mysql.com/projects/project.php?id=211

B.5.11: Is it possible for a trigger to update tables on a remote server?

Yes. A table on a remote server could be updated using the `FEDERATED` storage engine. (See Section 13.11, "The `FEDERATED` Storage Engine").

B.5.12: Do triggers work with replication?

Yes. However, the way in which they work depends whether you are using MySQL's "classic" statement-based replication available in all versions of MySQL, or the row-based replication format introduced in MySQL 5.1.

When using statement-based replication, triggers on the slave are executed by statements that are executed on the master (and replicated to the slave).

When using row-based replication, triggers are not executed on the slave due to statements that were run on the master and then replicated to the slave. Instead, when using row-based replication, the changes caused by executing the trigger on the master are applied on the slave.

For more information, see Section 15.4.1.30, "Replication and Triggers".

B.5.13: How are actions carried out through triggers on a master replicated to a slave?

Again, this depends on whether you are using statement-based or row-based replication.

Statement-based replication. First, the triggers that exist on a master must be re-created on the slave server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table `EMP` that has an `AFTER` insert trigger, which exists on a master MySQL server. The same `EMP` table and `AFTER` insert trigger exist on the slave server as well. The replication flow would be:

1. An `INSERT` statement is made to `EMP`.
2. The `AFTER` trigger on `EMP` activates.
3. The `INSERT` statement is written to the binary log.
4. The replication slave picks up the `INSERT` statement to `EMP` and executes it.
5. The `AFTER` trigger on `EMP` that exists on the slave activates.

Row-based replication. When you use row-based replication, the changes caused by executing the trigger on the master are applied on the slave. However, the triggers themselves are not actually executed on the slave under row-based replication. This is because, if both the master and the slave applied the changes from the master and—in addition—the trigger causing these changes were applied on the slave, the changes would in effect be applied twice on the slave, leading to different data on the master and the slave.

In most cases, the outcome is the same for both row-based and statement-based replication. However, if you use different triggers on the master and slave, you cannot use row-based replication. (This is because the row-based format replicates the changes made by triggers executing on the master to the slaves, rather than the statements that caused the triggers to execute, and the corresponding triggers on the slave are not executed.) Instead, any statements causing such triggers to be executed must be replicated using statement-based replication.

For more information, see Section 15.4.1.30, "Replication and Triggers".

B.6. MySQL 5.5 FAQ: Views

Questions

- B.6.1: Where can I find documentation covering MySQL Views?
- B.6.2: Is there a discussion forum for MySQL Views?
- B.6.3: What happens to a view if an underlying table is dropped or renamed?

- B.6.4: Does MySQL 5.5 have table snapshots?
- B.6.5: Does MySQL 5.5 have materialized views?
- B.6.6: Can you insert into views that are based on joins?

Questions and Answers

B.6.1: Where can I find documentation covering MySQL Views?

See Section 18.5, “Using Views”.

B.6.2: Is there a discussion forum for MySQL Views?

Yes. See http://forums.mysql.com/list.php?100

B.6.3: What happens to a view if an underlying table is dropped or renamed?

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the `CHECK TABLE` statement. (See Section 12.7.2.2, “`CHECK TABLE` Syntax”.)

B.6.4: Does MySQL 5.5 have table snapshots?

No.

B.6.5: Does MySQL 5.5 have materialized views?

No.

B.6.6: Can you insert into views that are based on joins?

It is possible, provided that your `INSERT` statement has a column list that makes it clear there is only one table involved.

You *cannot* insert into multiple tables with a single insert on a view.

B.7. MySQL 5.5 FAQ: `INFORMATION_SCHEMA`

Questions

- B.7.1: Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?
- B.7.2: Is there a discussion forum for `INFORMATION_SCHEMA`?
- B.7.3: Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?
- B.7.4: What is the difference between the Oracle Data Dictionary and MySQL's `INFORMATION_SCHEMA`?
- B.7.5: Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

Questions and Answers

B.7.1: Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?

See Chapter 19, *`INFORMATION_SCHEMA` Tables*

B.7.2: Is there a discussion forum for `INFORMATION_SCHEMA`?

See http://forums.mysql.com/list.php?101.

B.7.3: Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available—such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer—which give a comprehensive overview of the standard, including `INFORMATION_SCHEMA`.

B.7.4: What is the difference between the Oracle Data Dictionary and MySQL's `INFORMATION_SCHEMA`?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names.

MySQL's implementation is more similar to those found in DB2 and SQL Server, which also support `INFORMATION_SCHEMA` as defined in the SQL standard.

B.7.5: Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, *we cannot support bugs or other issues which result from modifying `INFORMATION_SCHEMA` tables or data*.

B.8. MySQL 5.5 FAQ: Migration

Questions

- B.8.1: Where can I find information on how to migrate from MySQL 5.1 to MySQL 5.5?
- B.8.2: How has storage engine (table type) support changed in MySQL 5.5 from previous versions?

Questions and Answers

B.8.1: Where can I find information on how to migrate from MySQL 5.1 to MySQL 5.5?

For detailed upgrade information, see Section 2.11.1, “Upgrading MySQL”. Do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major version to the next in each step. This may seem more complicated, but it will you save time and trouble—if you encounter problems during the upgrade, their origin will be easier to identify, either by you or—if you have a MySQL Enterprise subscription—by MySQL support.

B.8.2: How has storage engine (table type) support changed in MySQL 5.5 from previous versions?

Storage engine support has changed as follows:

- Support for `ISAM` tables was removed in MySQL 5.0 and you should now use the `MyISAM` storage engine in place of `ISAM`. To convert a table *`tblname`* from `ISAM` to `MyISAM`, simply issue a statement such as this one:

  ```
  ALTER TABLE tblname ENGINE=MYISAM;
  ```

- Internal `RAID` for `MyISAM` tables was also removed in MySQL 5.0. This was formerly used to allow large tables in file systems that did not support file sizes greater than 2GB. All modern file systems allow for larger tables; in addition, there are now other solutions such as `MERGE` tables and views.
- The `VARCHAR` column type now retains trailing spaces in all storage engines.
- `MEMORY` tables (formerly known as `HEAP` tables) can also contain `VARCHAR` columns.

B.9. MySQL 5.5 FAQ: Security

Questions

- B.9.1: Where can I find documentation that addresses security issues for MySQL?
- B.9.2: Does MySQL 5.5 have native support for SSL?
- B.9.3: Is SSL support be built into MySQL binaries, or must I recompile the binary myself to enable it?
- B.9.4: Does MySQL 5.5 have built-in authentication against LDAP directories?
- B.9.5: Does MySQL 5.5 include support for Roles Based Access Control (RBAC)?

Questions and Answers

B.9.1: Where can I find documentation that addresses security issues for MySQL?

The best place to start is Section 5.3, “General Security Issues”.

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- Section 5.3.1, “General Security Guidelines”.
- Section 5.3.3, “Making MySQL Secure Against Attackers”.
- Section C.5.4.1, “How to Reset the Root Password”.
- Section 5.3.6, “How to Run MySQL as a Normal User”.
- Section 22.3.2.6, “User-Defined Function Security Precautions”.
- Section 5.3.4, “Security-Related `mysqld` Options”.
- Section 5.3.5, “Security Issues with `LOAD DATA LOCAL`”.
- Section 2.10, “Postinstallation Setup and Testing”.
- Section 5.5.8.1, “Basic SSL Concepts”.

B.9.2: Does MySQL 5.5 have native support for SSL?

Most 5.5 binaries have support for SSL connections between the client and server. We can't currently build with the new YaSSL library everywhere, as it is still quite new and does not compile on all platforms yet. See Section 5.5.8, “Using SSL for Secure Connections”.

You can also tunnel a connection using SSH, if (for example) the client application doesn't support SSL connections. For an example, see Section 5.5.9, “Connecting to MySQL Remotely from Windows with SSH”.

B.9.3: Is SSL support be built into MySQL binaries, or must I recompile the binary myself to enable it?

Most 5.5 binaries have SSL enabled for client/server connections that are secured, authenticated, or both. However, the YaSSL library currently does not compile on all platforms. See Section 5.5.8, “Using SSL for Secure Connections”, for a complete listing of supported and unsupported platforms.

B.9.4: Does MySQL 5.5 have built-in authentication against LDAP directories?

Not at this time.

B.9.5: Does MySQL 5.5 include support for Roles Based Access Control (RBAC)?

Not at this time.

B.10. MySQL FAQ: MySQL 5.5 and MySQL Cluster

In the following section, we answer questions that are frequently asked about MySQL Cluster and the `NDBCLUSTER` storage engine.

Questions

- B.10.1: Which versions of the MySQL software support Cluster? Do I have to compile from source?
- B.10.2: What do “NDB” and “NDBCLUSTER” mean?
- B.10.3: What is the difference between using MySQL Cluster *vs* using MySQL Replication?
- B.10.4: Do I need any special networking to run MySQL Cluster? How do computers in a cluster communicate?
- B.10.5: How many computers do I need to run a MySQL Cluster, and why?
- B.10.6: What do the different computers do in a MySQL Cluster?
- B.10.7: When I run the `SHOW` command in the MySQL Cluster management client, I see a line of output that looks like this:

  ```
  id=2    @10.100.10.32  (Version: 5.5.23, Nodegroup: 0, Master)
  ```

  What is a “master node”, and what does it do? How do I configure a node so that it is the master?
- B.10.8: With which operating systems can I use MySQL Cluster?
- B.10.9: What are the hardware requirements for running MySQL Cluster?

- B.10.10: How much RAM do I need to use MySQL Cluster? Is it possible to use disk memory at all?
- B.10.11: What file systems can I use with MySQL Cluster? What about network file systems or network shares?
- B.10.12: Can I run MySQL Cluster nodes inside virtual machines (such as those created by VMWare, Parallels, or Xen)?
- B.10.13: I am trying to populate a MySQL Cluster database. The loading process terminates prematurely and I get an error message like this one: `ERROR 1114: THE TABLE 'MY_CLUSTER_TABLE' IS FULL` Why is this happening?
- B.10.14: MySQL Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or more nodes in remote locations?
- B.10.15: Do I have to learn a new programming or query language to use MySQL Cluster?
- B.10.16: How do I find out what an error or warning message means when using MySQL Cluster?
- B.10.17: Is MySQL Cluster transaction-safe? What isolation levels are supported?
- B.10.18: What storage engines are supported by MySQL Cluster?
- B.10.19: In the event of a catastrophic failure—say, for instance, the whole city loses power *and* my UPS fails—would I lose all my data?
- B.10.20: Is it possible to use `FULLTEXT` indexes with MySQL Cluster?
- B.10.21: Can I run multiple nodes on a single computer?
- B.10.22: Are there any limitations that I should be aware of when using MySQL Cluster?
- B.10.23: How do I import an existing MySQL database into a MySQL Cluster?
- B.10.24: How do MySQL Cluster nodes communicate with one another?
- B.10.25: What is an *arbitrator*?
- B.10.26: What data types are supported by MySQL Cluster?
- B.10.27: How do I start and stop MySQL Cluster?
- B.10.28: What happens to MySQL Cluster data when the MySQL Cluster is shut down?
- B.10.29: Is it a good idea to have more than one management node for a MySQL Cluster?
- B.10.30: Can I mix different kinds of hardware and operating systems in one MySQL Cluster?
- B.10.31: Can I run two data nodes on a single host? Two SQL nodes?
- B.10.32: Can I use host names with MySQL Cluster?
- B.10.33: Does MySQL Cluster support IPv6?
- B.10.34: How do I handle MySQL users in a MySQL Cluster having multiple MySQL servers?
- B.10.35: How do I continue to send queries in the event that one of the SQL nodes fails?
- B.10.36: How do I back up and restore a MySQL Cluster?
- B.10.37: What is an “angel process”?

Questions and Answers

B.10.1: Which versions of the MySQL software support Cluster? Do I have to compile from source?

MySQL Cluster is not supported in standard MySQL Server 5.5 releases. Instead, MySQL Cluster is provided as a separate product. Currently, the following MySQL Cluster release series are available for production use:

- **MySQL Cluster NDB 6.3.** This series is still maintained and available for use but is not recommended for new deployments. The most recent MySQL Cluster NDB 6.3 release can be obtained from `http://dev.mysql.com/downloads/cluster/`.

- **MySQL Cluster NDB 7.0.** This series is still available for use in production, although MySQL Cluster NDB 7.2 is recommended for new deployments. The most recent MySQL Cluster NDB 7.0 release can be obtained from http://dev.mysql.com/downloads/cluster/.

- **MySQL Cluster NDB 7.1.** This series is the previous Generally Available (GA) version of MySQL Cluster, still available for production, although we recommend that new deployments use the latest MySQL Cluster NDB 7.2 release. The most recent MySQL Cluster NDB 7.1 release can be obtained from http://dev.mysql.com/downloads/cluster/.

MySQL Cluster NDB 7.2. This series is the latest Generally Available (GA) version of MySQL Cluster, based on version 7.2 of the `NDBCLUSTER` storage engine and MySQL Server 5.5. New deployments should use the latest release in this series. The most recent MySQL Cluster NDB 7.2 release can be obtained from http://dev.mysql.com/downloads/cluster/.

You should use MySQL NDB Cluster NDB 7.1 or MySQL NDB Cluster NDB 7.2 for any new deployments; if you are using an older version of MySQL Cluster, you should upgrade to one of these soon as possible. For an overview of improvements made in MySQL Cluster NDB 7.1, see MySQL Cluster Development in MySQL Cluster NDB 7.1; for information about improvements made in MySQL Cluster NDB 7.2, see Section 16.1.4.1, “MySQL Cluster Development in MySQL Cluster NDB 7.2”.

You can determine whether your MySQL Server has `NDBCLUSTER` support using one of the statements `SHOW VARIABLES LIKE 'have_%'`, `SHOW ENGINES`, or `SHOW PLUGINS`.

B.10.2: What do “NDB” and “NDBCLUSTER” mean?

“NDB” stands for “**N**etwork **D**ata**b**ase”. `NDB` and `NDBCLUSTER` are both names for the storage engine that enables clustering support in MySQL. While our developers prefer `NDB`, either name is correct; both names appear in our documentation, and either name can be used in the `ENGINE` option of a `CREATE TABLE` statement for creating a MySQL Cluster table.

B.10.3: What is the difference between using MySQL Cluster *vs* using MySQL Replication?

In traditional MySQL replication, a master MySQL server updates one or more slaves. Transactions are committed sequentially, and a slow transaction can cause the slave to lag behind the master. This means that if the master fails, it is possible that the slave might not have recorded the last few transactions. If a transaction-safe engine such as `InnoDB` is being used, a transaction will either be complete on the slave or not applied at all, but replication does not guarantee that all data on the master and the slave will be consistent at all times. In MySQL Cluster, all data nodes are kept in synchrony, and a transaction committed by any one data node is committed for all data nodes. In the event of a data node failure, all remaining data nodes remain in a consistent state.

In short, whereas standard MySQL replication is *asynchronous*, MySQL Cluster is *synchronous*.

Asynchronous replication is also available in MySQL Cluster. *MySQL Cluster Replication* (also sometimes known as “geo-replication”) includes the capability to replicate both between two MySQL Clusters, and from a MySQL Cluster to a non-Cluster MySQL server. See Section 16.6, “MySQL Cluster Replication”.

B.10.4: Do I need any special networking to run MySQL Cluster? How do computers in a cluster communicate?

MySQL Cluster is intended to be used in a high-bandwidth environment, with computers connecting using TCP/IP. Its performance depends directly upon the connection speed between the cluster's computers. The minimum connectivity requirements for MySQL Cluster include a typical 100-megabit Ethernet network or the equivalent. We recommend you use gigabit Ethernet whenever available.

The faster SCI protocol is also supported, but requires special hardware. See Section 16.3.5, “Using High-Speed Interconnects with MySQL Cluster”, for more information about SCI.

B.10.5: How many computers do I need to run a MySQL Cluster, and why?

A minimum of three computers is required to run a viable cluster. However, the minimum *recommended* number of computers in a MySQL Cluster is four: one each to run the management and SQL nodes, and two computers to serve as data nodes. The purpose of the two data nodes is to provide redundancy; the management node must run on a separate machine to guarantee continued arbitration services in the event that one of the data nodes fails.

To provide increased throughput and high availability, you should use multiple SQL nodes (MySQL Servers connected to the cluster). It is also possible (although not strictly necessary) to run multiple management servers.

B.10.6: What do the different computers do in a MySQL Cluster?

A MySQL Cluster has both a physical and logical organization, with computers being the physical elements. The logical or functional elements of a cluster are referred to as *nodes*, and a computer housing a cluster node is sometimes referred to as a *cluster host*. There are three types of nodes, each corresponding to a specific role within the cluster. These are:

- **Management node.** This node provides management services for the cluster as a whole, including startup, shutdown, backups, and configuration data for the other nodes. The management node server is implemented as the application `ndb_mgmd`; the

management client used to control MySQL Cluster is `ndb_mgm`. See Section 16.4.4, “`ndb_mgmd` — The MySQL Cluster Management Server Daemon”, and Section 16.4.5, “`ndb_mgm` — The MySQL Cluster Management Client”, for information about these programs.

- **Data node.** This type of node stores and replicates data. Data node functionality is handled by instances of the `NDB` data node process `ndbd`. For more information, see Section 16.4.2, “`ndbd` — The MySQL Cluster Data Node Daemon”.

- **SQL node.** This is simply an instance of MySQL Server (`mysqld`) that is built with support for the `NDBCLUSTER` storage engine and started with the `--ndb-cluster` option to enable the engine and the `--ndb-connectstring` option to enable it to connect to a MySQL Cluster management server. For more about these options, see Section 16.3.4.2, “MySQL Server Options for MySQL Cluster”.

  > **Note**
  >
  > An *API node* is any application that makes direct use of Cluster data nodes for data storage and retrieval. An SQL node can thus be considered a type of API node that uses a MySQL Server to provide an SQL interface to the Cluster. You can write such applications (that do not depend on a MySQL Server) using the NDB API, which supplies a direct, object-oriented transaction and scanning interface to MySQL Cluster data; see MySQL Cluster API Overview: The NDB API, for more information.

B.10.7: When I run the `SHOW` command in the MySQL Cluster management client, I see a line of output that looks like this:

```
id=2    @10.100.10.32  (Version: 5.5.23, Nodegroup: 0, Master)
```

What is a “master node”, and what does it do? How do I configure a node so that it is the master?

The simplest answer is, “It's not something you can control, and it's nothing that you need to worry about in any case, unless you're a software engineer writing or analyzing the MySQL Cluster source code”.

If you don't find that answer satisfactory, here's a longer and more technical version:

A number of mechanisms in MySQL Cluster require distributed coordination among the data nodes. These distributed algorithms and protocols include global checkpointing, DDL (schema) changes, and node restart handling. To make this coordination simpler, the data nodes “elect” one of their number to be a “master”. There is no user-facing mechanism for influencing this selection, which is is completely automatic; the fact that it *is* automatic is a key part of MySQL Cluster's internal architecture.

When a node acts as a master for any of these mechanisms, it is usually the point of coordination for the activity, and the other nodes act as “servants”, carrying out their parts of the activity as directed by the master. If the node acting as master fails, then the remaining nodes elect a new master. Tasks in progress that were being coordinated by the old master may either fail or be continued by the new master, depending on the actual mechanism involved.

It is possible for some of these different mechanisms and protocols to have different master nodes, but in general the same master is chosen for all of them. The node indicated as the master in the output of `SHOW` in the management client is actually the `DICT` master (see The `DBDICT` Block, in the *MySQL Cluster API Developer Guide*, for more information), responsible for coordinating DDL and metadata activity.

MySQL Cluster is designed in such a way that the choice of master has no discernable effect outside the cluster itself. For example, the current master does not have significantly higher CPU or resource usage than the other data nodes, and failure of the master should not have a significantly different impact on the cluster than the failure of any other data node.

B.10.8: With which operating systems can I use MySQL Cluster?

MySQL Cluster is supported on most Unix-like operating systems. MySQL Cluster NDB 7.2 is also supported in production settings on Microsoft Windows operating systems.

For more detailed information concerning the level of support which is offered for MySQL Cluster on various operating system versions, operating system distributions, and hardware platforms, please refer to `http://www.mysql.com/support/supportedplatforms/cluster.html`.

B.10.9: What are the hardware requirements for running MySQL Cluster?

MySQL Cluster should run on any platform for which `NDB`-enabled binaries are available. For data nodes and API nodes, faster CPUs and more memory are likely to improve performance, and 64-bit CPUs are likely to be more effective than 32-bit processors. There must be sufficient memory on machines used for data nodes to hold each node's share of the database (see *How much RAM do I Need?* for more information). For a computer which is used only for running the MySQL Cluster management server, the requirements are minimal; a common desktop PC (or the equivalent) is generally sufficient for this task. Nodes can communicate through the standard TCP/IP network and hardware. They can also use the high-speed SCI protocol; however, special networking hardware and software are required to use SCI (see Section 16.3.5, “Using High-Speed Interconnects with MySQL Cluster”).

B.10.10: How much RAM do I need to use MySQL Cluster? Is it possible to use disk memory at all?

Formerly MySQL Cluster was in-memory only. MySQL 5.1 and later also provide the ability to store MySQL Cluster on disk. (Note that we have no plans to backport this capability to previous releases.) See Section 16.5.11, "MySQL Cluster Disk Data Tables", for more information.

For in-memory `NDB` tables, you can use the following formula for obtaining a rough estimate of how much RAM is needed for each data node in the cluster:

```
(SizeofDatabase × NumberOfReplicas × 1.1 ) / NumberOfDataNodes
```

To calculate the memory requirements more exactly requires determining, for each table in the cluster database, the storage space required per row (see Section 10.5, "Data Type Storage Requirements", for details), and multiplying this by the number of rows. You must also remember to account for any column indexes as follows:

- Each primary key or hash index created for an `NDBCLUSTER` table requires 21–25 bytes per record. These indexes use `IndexMemory`.
- Each ordered index requires 10 bytes storage per record, using `DataMemory`.
- Creating a primary key or unique index also creates an ordered index, unless this index is created with `USING HASH`. In other words:
  - A primary key or unique index on a Cluster table normally takes up 31 to 35 bytes per record.
  - However, if the primary key or unique index is created with `USING HASH`, then it requires only 21 to 25 bytes per record.

Note that creating MySQL Cluster tables with `USING HASH` for all primary keys and unique indexes will generally cause table updates to run more quickly—in some cases by a much as 20 to 30 percent faster than updates on tables where `USING HASH` was not used in creating primary and unique keys. This is due to the fact that less memory is required (because no ordered indexes are created), and that less CPU must be utilized (because fewer indexes must be read and possibly updated). However, it also means that queries that could otherwise use range scans must be satisfied by other means, which can result in slower selects.

When calculating Cluster memory requirements, you may find useful the `ndb_size.pl` utility which is available in recent MySQL 5.5 releases. This Perl script connects to a current (non-Cluster) MySQL database and creates a report on how much space that database would require if it used the `NDBCLUSTER` storage engine. For more information, see Section 16.4.21, "`ndb_size.pl` — NDBCLUSTER Size Requirement Estimator".

It is especially important to keep in mind that *every MySQL Cluster table must have a primary key*. The `NDB` storage engine creates a primary key automatically if none is defined; this primary key is created without `USING HASH`.

There is no easy way to determine exactly how much memory is being used for storage of Cluster indexes at any given time; however, warnings are written to the Cluster log when 80% of available `DataMemory` or `IndexMemory` is in use, and again when use reaches 85%, 90%, and so on.

B.10.11: What file systems can I use with MySQL Cluster? What about network file systems or network shares?

Generally, any file system that is native to the host operating system should work well with MySQL Cluster. If you find that a given file system works particularly well (or not so especially well) with MySQL Cluster, we invite you to discuss your findings in the MySQL Cluster Forums.

For Windows, we recommend that you use `NTFS` file systems for MySQL Cluster, just as we do for standard MySQL. We do not test MySQL Cluster with `FAT` or `VFAT` file systems. Because of this, we do not recommend their use with MySQL or MySQL Cluster.

MySQL Cluster is implemented as a shared-nothing solution; the idea behind this is that the failure of a single piece of hardware should not cause the failure of multiple cluster nodes, or possibly even the failure of the cluster as a whole. For this reason, the use of network shares or network file systems is not supported for MySQL Cluster. This also applies to shared storage devices such as SANs.

B.10.12: Can I run MySQL Cluster nodes inside virtual machines (such as those created by VMWare, Parallels, or Xen)?

This is possible but not recommended for a production environment.

We have found that running MySQL Cluster processes inside a virtual machine can give rise to issues with timing and disk subsystems that have a strong negative impact on the operation of the cluster. The behavior of the cluster is often unpredictable in these cases.

If an issue can be reproduced outside the virtual environment, then we may be able to provide assistance. Otherwise, we cannot support it at this time.

B.10.13: I am trying to populate a MySQL Cluster database. The loading process terminates prematurely and I get an error message like this one: `ERROR 1114: THE TABLE 'MY_CLUSTER_TABLE' IS FULL` Why is this happening?

The cause is very likely to be that your setup does not provide sufficient RAM for all table data and all indexes, *including the primary key required by the `NDB` storage engine and automatically created in the event that the table definition does not include the definition of a primary key*.

It is also worth noting that all data nodes should have the same amount of RAM, since no data node in a cluster can use more memory than the least amount available to any individual data node. For example, if there are four computers hosting Cluster data nodes, and three of these have 3GB of RAM available to store Cluster data while the remaining data node has only 1GB RAM, then each data node can devote at most 1GB to MySQL Cluster data and indexes.

In some cases it is possible to get `TABLE IS FULL` errors in MySQL client applications even when `ndb_mgm -e "ALL REPORT MEMORYUSAGE"` shows significant free `DataMemory`. You can force `NDB` to create extra partitions for MySQL Cluster tables and thus have more memory available for hash indexes by using the `MAX_ROWS` option for `CREATE TABLE`. In general, setting `MAX_ROWS` to twice the number of rows that you expect to store in the table should be sufficient.

For similar reasons, you can also sometimes encounter problems with data node restarts on nodes that are heavily loaded with data. In MySQL Cluster NDB 7.1 and MySQL Cluster NDB 7.2, the addition of the `MinFreePct` parameter helps with this issue.

B.10.14: MySQL Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or more nodes in remote locations?

It is *very* unlikely that a cluster would perform reliably under such conditions, as MySQL Cluster was designed and implemented with the assumption that it would be run under conditions guaranteeing dedicated high-speed connectivity such as that found in a LAN setting using 100 Mbps or gigabit Ethernet—preferably the latter. We neither test nor warrant its performance using anything slower than this.

Also, it is extremely important to keep in mind that communications between the nodes in a MySQL Cluster are not secure; they are neither encrypted nor safeguarded by any other protective mechanism. The most secure configuration for a cluster is in a private network behind a firewall, with no direct access to any Cluster data or management nodes from outside. (For SQL nodes, you should take the same precautions as you would with any other instance of the MySQL server.) For more information, see Section 16.5.10, “MySQL Cluster Security Issues”.

B.10.15: Do I have to learn a new programming or query language to use MySQL Cluster?

No. Although some specialized commands are used to manage and configure the cluster itself, only standard (My)SQL statements are required for the following operations:

- Creating, altering, and dropping tables
- Inserting, updating, and deleting table data
- Creating, changing, and dropping primary and unique indexes

Some specialized configuration parameters and files are required to set up a MySQL Cluster—see Section 16.3.2, “MySQL Cluster Configuration Files”, for information about these.

A few simple commands are used in the MySQL Cluster management client (`ndb_mgm`) for tasks such as starting and stopping cluster nodes. See Section 16.5.2, “Commands in the MySQL Cluster Management Client”.

B.10.16: How do I find out what an error or warning message means when using MySQL Cluster?

There are two ways in which this can be done:

- From within the `mysql` client, use `SHOW ERRORS` or `SHOW WARNINGS` immediately upon being notified of the error or warning condition.
- From a system shell prompt, use `perror --ndb error_code`.

B.10.17: Is MySQL Cluster transaction-safe? What isolation levels are supported?

Yes. For tables created with the `NDB` storage engine, transactions are supported. Currently, MySQL Cluster supports only the `READ COMMITTED` transaction isolation level.

B.10.18: What storage engines are supported by MySQL Cluster?

Clustering with MySQL is supported only by the NDB storage engine. That is, in order for a table to be shared between nodes in a MySQL Cluster, the table must be created using ENGINE=NDB (or the equivalent option ENGINE=NDBCLUSTER).

It is possible to create tables using other storage engines (such as MyISAM or InnoDB) on a MySQL server being used with a MySQL Cluster, but these non-NDB tables do *not* participate in clustering; each such table is strictly local to the individual MySQL server instance on which it is created.

B.10.19: In the event of a catastrophic failure—say, for instance, the whole city loses power and my UPS fails—would I lose all my data?

All committed transactions are logged. Therefore, although it is possible that some data could be lost in the event of a catastrophe, this should be quite limited. Data loss can be further reduced by minimizing the number of operations per transaction. (It is not a good idea to perform large numbers of operations per transaction in any case.)

B.10.20: Is it possible to use FULLTEXT indexes with MySQL Cluster?

FULLTEXT indexing is currently not supported by any MySQL storage engine other than MyISAM.

B.10.21: Can I run multiple nodes on a single computer?

It is possible but not always advisable. One of the chief reasons to run a cluster is to provide redundancy. To obtain the full benefits of this redundancy, each node should reside on a separate machine. If you place multiple nodes on a single machine and that machine fails, you lose all of those nodes. For this reason, if you do run multiple data nodes on a single machine, it is *extremely* important that they be set up in such a way that the failure of this machine does not cause the loss of all the data nodes in a given node group.

Given that MySQL Cluster can be run on commodity hardware loaded with a low-cost (or even no-cost) operating system, the expense of an extra machine or two is well worth it to safeguard mission-critical data. It also worth noting that the requirements for a cluster host running a management node are minimal. This task can be accomplished with a 300 MHz Pentium or equivalent CPU and sufficient RAM for the operating system, plus a small amount of overhead for the ndb_mgmd and ndb_mgm processes.

It is acceptable to run multiple cluster data nodes on a single host that has multiple CPUs, cores, or both. MySQL Cluster NDB 7.0 and later also provide a multi-threaded version of the data node binary intended for use on such systems. For more information, see Section 16.4.3, “ndbmtd — The MySQL Cluster Data Node Daemon (Multi-Threaded)”.

It is also possible in some cases to run data nodes and SQL nodes concurrently on the same machine; how well such an arrangement performs is dependent on a number of factors such as number of cores and CPUs as well as the amount of disk and memory available to the data node and SQL node processes, and you must take these factors into account when planning such a configuration.

B.10.22: Are there any limitations that I should be aware of when using MySQL Cluster?

Limitations on NDB tables in MySQL MySQL Cluster NDB 7.2 include the following:

- Temporary tables are not supported; a CREATE TEMPORARY TABLE statement using ENGINE=NDB or ENGINE=NDBCLUSTER fails with an error.
- The only types of user-defined partitioning supported for NDBCLUSTER tables are KEY and LINEAR KEY. Trying to create an NDB table using any other partitioning type fails with an error.
- FULLTEXT indexes are not supported.
- Index prefixes are not supported. Only complete columns may be indexed.
- Spatial indexes are not supported (although spatial columns can be used). See Section 11.17, “Spatial Extensions”.
- Support for partial transactions and partial rollbacks is comprabale to that of other transactional storage engines such as InnoDB that can roll back individual statements.
- The maximum number of attributes allowed per table is 512. Attribute names cannot be any longer than 31 characters. For each table, the maximum combined length of the table and database names is 122 characters.
- The maximum size for a table row is 14 kilobytes, not counting BLOB values.

  There is no set limit for the number of rows per NDB table. Limts on table size depend on a number of factors, in particular on the amount of RAM available to each data node.
- The NDBCLUSTER engine does not support foreign key constraints. As with MyISAM tables, if these are specified in a CREATE TABLE or ALTER TABLE statement, they are ignored.

For a complete listing of limitations in MySQL Cluster, see Section 16.1.6, “Known Limitations of MySQL Cluster”. See also Section 16.1.6.11, “Previous MySQL Cluster Issues Resolved in MySQL 5.1, MySQL Cluster NDB 6.x, and MySQL Cluster NDB 7.x”.

B.10.23: How do I import an existing MySQL database into a MySQL Cluster?

You can import databases into MySQL Cluster much as you would with any other version of MySQL. Other than the limitations mentioned elsewhere in this FAQ, the only other special requirement is that any tables to be included in the cluster must use the `NDB` storage engine. This means that the tables must be created with `ENGINE=NDB` or `ENGINE=NDBCLUSTER`.

It is also possible to convert existing tables that use other storage engines to `NDBCLUSTER` using one or more `ALTER TABLE` statement. However, the definition of the table must be compatible with the `NDBCLUSTER` storage engine prior to making the conversion. In MySQL 5.5, an additional workaround is also required; see Section 16.1.6, “Known Limitations of MySQL Cluster”, for details.

B.10.24: How do MySQL Cluster nodes communicate with one another?

Cluster nodes can communicate through any of three different transport mechanisms: TCP/IP, SHM (shared memory), and SCI (Scalable Coherent Interface). Where available, SHM is used by default between nodes residing on the same cluster host; however, this is considered experimental. SCI is a high-speed (1 gigabit per second and higher), high-availability protocol used in building scalable multi-processor systems; it requires special hardware and drivers. See Section 16.3.5, “Using High-Speed Interconnects with MySQL Cluster”, for more about using SCI as a transport mechanism for MySQL Cluster.

B.10.25: What is an *arbitrator*?

If one or more data nodes in a cluster fail, it is possible that not all cluster data nodes will be able to “see” one another. In fact, it is possible that two sets of data nodes might become isolated from one another in a network partitioning, also known as a “split-brain” scenario. This type of situation is undesirable because each set of data nodes tries to behave as though it is the entire cluster. An arbitrator is required to decide between the competing sets of data nodes.

When all data nodes in at least one node group are alive, network partitioning is not an issue, because no single subset of the cluster can form a functional cluster on its own. The real problem arises when no single node group has all its nodes alive, in which case network partitioning (the “split-brain” scenario) becomes possible. Then an arbitrator is required. All cluster nodes recognize the same node as the arbitrator, which is normally the management server; however, it is possible to configure any of the MySQL Servers in the cluster to act as the arbitrator instead. The arbitrator accepts the first set of cluster nodes to contact it, and tells the remaining set to shut down. Arbitrator selection is controlled by the `ArbitrationRank` configuration parameter for MySQL Server and management server nodes. In MySQL Cluster NDB 7.0.7 and later, you can also use the `ArbitrationRank` configuration parameter to control the arbitrator selection process. For more information about these parameters, see Section 16.3.2.5, “Defining a MySQL Cluster Management Server”.

The role of arbitrator does not in and of itself impose any heavy demands upon the host so designated, and thus the arbitrator host does not need to be particularly fast or to have extra memory especially for this purpose.

B.10.26: What data types are supported by MySQL Cluster?

MySQL Cluster supports all of the usual MySQL data types, including those associated with MySQL's spatial extensions; however, the `NDB` storage engine does not support spatial indexes. (Spatial indexes are supported only by `MyISAM`; see Section 11.17, “Spatial Extensions”, for more information.) In addition, there are some differences with regard to indexes when used with `NDB` tables.

> **Note**
>
> MySQL Cluster Disk Data tables (that is, tables created with `TABLESPACE ... STORAGE DISK ENGINE=NDB` or `TABLESPACE ... STORAGE DISK ENGINE=NDBCLUSTER`) have only fixed-width rows. This means that (for example) each Disk Data table record containing a `VARCHAR(255)` column requires space for 255 characters (as required for the character set and collation being used for the table), regardless of the actual number of characters stored therein.

See Section 16.1.6, “Known Limitations of MySQL Cluster”, for more information about these issues.

B.10.27: How do I start and stop MySQL Cluster?

It is necessary to start each node in the cluster separately, in the following order:

1. Start the management node, using the `ndb_mgmd` command.

   You must include the `-f` or `--config-file` option to tell the management node where its configuration file can be found.

2. Start each data node with the `ndbd` command.

Each data node must be started with the `-c` or `--connect-string` option so that the data node knows how to connect to the management server.

3. Start each MySQL Server (SQL node) using your preferred startup script, such as `mysqld_safe`.

   Each MySQL Server must be started with the `--ndbcluster` and `--ndb-connectstring` options. These options cause mysqld to enable `NDBCLUSTER` storage engine support and how to connect to the management server.

Each of these commands must be run from a system shell on the machine housing the affected node. (You do not have to be physically present at the machine—a remote login shell can be used for this purpose.) You can verify that the cluster is running by starting the `NDB` management client `ndb_mgm` on the machine housing the management node and issuing the `SHOW` or `ALL STATUS` command.

To shut down a running cluster, issue the command `SHUTDOWN` in the management client. Alternatively, you may enter the following command in a system shell:

```
shell> ndb_mgm -e "SHUTDOWN"
```

(The quotation marks in this example are optional, since there are no spaces in the command string following the `-e` option; in addition, the `SHUTDOWN` command, like other management client commands, is not case-sensitive.)

Either of these commands causes the `ndb_mgm`, `ndb_mgm`, and any `ndbd` processes to terminate gracefully. MySQL servers running as SQL nodes can be stopped using `mysqladmin shutdown`.

For more information, see Section 16.5.2, “Commands in the MySQL Cluster Management Client”, and Section 16.2.6, “Safe Shutdown and Restart of MySQL Cluster”.

B.10.28: What happens to MySQL Cluster data when the MySQL Cluster is shut down?

The data that was held in memory by the cluster's data nodes is written to disk, and is reloaded into memory the next time that the cluster is started.

B.10.29: Is it a good idea to have more than one management node for a MySQL Cluster?

It can be helpful as a fail-safe. Only one management node controls the cluster at any given time, but it is possible to configure one management node as primary, and one or more additional management nodes to take over in the event that the primary management node fails.

See Section 16.3.2, “MySQL Cluster Configuration Files”, for information on how to configure MySQL Cluster management nodes.

B.10.30: Can I mix different kinds of hardware and operating systems in one MySQL Cluster?

Yes, as long as all machines and operating systems have the same “endianness” (all big-endian or all little-endian). We are working to overcome this limitation in a future MySQL Cluster release.

It is also possible to use software from different MySQL Cluster releases on different nodes. However, we support this only as part of a rolling upgrade procedure (see Section 16.5.4, “Performing a Rolling Restart of a MySQL Cluster”).

B.10.31: Can I run two data nodes on a single host? Two SQL nodes?

Yes, it is possible to do this. In the case of multiple data nodes, it is advisable (but not required) for each node to use a different data directory. If you want to run multiple SQL nodes on one machine, each instance of `mysqld` must use a different TCP/IP port. However, in MySQL 5.5, running more than one cluster node of a given type per machine is generally not encouraged or supported for production use.

We also advise against running data nodes and SQL nodes together on the same host, since the `ndbd` and `mysqld` processes may compete for memory.

B.10.32: Can I use host names with MySQL Cluster?

Yes, it is possible to use DNS and DHCP for cluster hosts. However, if your application requires “five nines” availability, you should use fixed (numeric) IP addresses, since making communication between Cluster hosts dependent on services such as DNS and DHCP introduces additional potential points of failure.

B.10.33: Does MySQL Cluster support IPv6?

IPv6 is supported for connections between SQL nodes (MySQL servers), but connections between all other types of MySQL Cluster nodes must use IPv4.

In practical terms, this means that you can use IPv6 for replication between MySQL Clusters, but connections between nodes in the same MySQL Cluster must use IPv4. For more information, see Section 16.6.3, “Known Issues in MySQL Cluster Replication”.

B.10.34: How do I handle MySQL users in a MySQL Cluster having multiple MySQL servers?

MySQL user accounts and privileges are normally not automatically propagated between different MySQL servers accessing the same MySQL Cluster. Beginning with MySQL Cluster NDB 7.2, MySQL Cluster provides support for distributed privileges. While privilege distribution is not enabled automatically, you can activate it by following a procedure provided in the MySQL Cluster documentation. See Section 16.5.13, “Distributed MySQL Privileges for MySQL Cluster”, for more information.

B.10.35: How do I continue to send queries in the event that one of the SQL nodes fails?

MySQL Cluster does not provide any sort of automatic failover between SQL nodes. Your application must be prepared to handlethe loss of SQL nodes and to fail over between them.

B.10.36: How do I back up and restore a MySQL Cluster?

You can use the NDB native backup and restore functionality in the MySQL Cluster management client and the `ndb_restore` program. See Section 16.5.3, “Online Backup of MySQL Cluster”, and Section 16.4.17, “`ndb_restore` — Restore a MySQL Cluster Backup”.

You can also use the traditional functionality provided for this purpose in `mysqldump` and the MySQL server. See Section 4.5.4, “`mysqldump` — A Database Backup Program”, for more information.

B.10.37: What is an “angel process”?

This process monitors and, if necessary, attempts to restart the data node process. If you check the list of active processes on your system after starting `ndbd`, you can see that there are actually 2 processes running by that name, as shown here (we omit the output from `ndb_mgmd` and `ndbd` for brevity):

```
shell> ./ndb_mgmd

shell> ps aux | grep ndb
me      23002  0.0  0.0 122948  3104 ?        Ssl  14:14   0:00 ./ndb_mgmd
me      23025  0.0  0.0   5284   820 pts/2    S+   14:14   0:00 grep ndb

shell> ./ndbd -c 127.0.0.1 --initial

shell> ps aux | grep ndb
me      23002  0.0  0.0 123080  3356 ?        Ssl  14:14   0:00 ./ndb_mgmd
me      23096  0.0  0.0  35876  2036 ?        Ss   14:14   0:00 ./ndbd -c 127.0.0.1 --initial
me      23097  1.0  2.4 524116 91096 ?        Sl   14:14   0:00 ./ndbd -c 127.0.0.1 --initial
me      23168  0.0  0.0   5284   812 pts/2    R+   14:15   0:00 grep ndb
```

The `ndbd` process showing 0 memory and CPU usage is the angel process. It actually does use a very small amount of each, of course. It simply checks to see if the main `ndbd` process (the primary data node process that actually handles the data) is running. If permitted to do so (for example, if the `StopOnError` configuration parameter is set to false—see Section 16.3.3.1, “MySQL Cluster Data Node Configuration Parameters”), the angel process tries to restart the primary data node process.

B.11. MySQL 5.5 FAQ: MySQL Chinese, Japanese, and Korean Character Sets

This set of Frequently Asked Questions derives from the experience of MySQL's Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

Questions

- B.11.1: What CJK character sets are available in MySQL?
- B.11.2: I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?
- B.11.3: What problems should I be aware of when working with the Big5 Chinese character set?
- B.11.4: Why do Japanese character set conversions fail?
- B.11.5: What should I do if I want to convert SJIS `81CA` to `cp932`?
- B.11.6: How does MySQL represent the Yen (¥) sign?
- B.11.7: Does MySQL plan to make a separate character set where `5C` is the Yen sign, as at least one other major DBMS does?

- B.11.8: Of what issues should I be aware when working with Korean character sets in MySQL?
- B.11.9: Why do I get `INCORRECT STRING VALUE` error messages?
- B.11.10: Why does my GUI front end or browser not display CJK characters correctly in my application using Access, PHP, or another API?
- B.11.11: I've upgraded to MySQL 5.5. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?
- B.11.12: Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?
- B.11.13: How do I know whether character *X* is available in all character sets?
- B.11.14: Why do CJK strings sort incorrectly in Unicode? (I)
- B.11.15: Why do CJK strings sort incorrectly in Unicode? (II)
- B.11.16: Why are my supplementary characters rejected by MySQL?
- B.11.17: Shouldn't it be “CJKV”?
- B.11.18: Does MySQL allow CJK characters to be used in database and table names?
- B.11.19: Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?
- B.11.20: Where can I get help with CJK and related issues in MySQL?

Questions and Answers

B.11.1: What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the `eucjpms` character set was not supported prior to MySQL 5.0.3 (see Changes in MySQL 5.0.3). However, since the name of the applicable language appears in the `DESCRIPTION` column for every entry in the `INFORMATION_SCHEMA.CHARACTER_SETS` table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
    -> FROM INFORMATION_SCHEMA.CHARACTER_SETS
    -> WHERE DESCRIPTION LIKE '%Chinese%'
    -> OR DESCRIPTION LIKE '%Japanese%'
    -> OR DESCRIPTION LIKE '%Korean%'
    -> ORDER BY CHARACTER_SET_NAME;
+--------------------+---------------------------+
| CHARACTER_SET_NAME | DESCRIPTION               |
+--------------------+---------------------------+
| big5               | Big5 Traditional Chinese  |
| cp932              | SJIS for Windows Japanese |
| eucjpms            | UJIS for Windows Japanese |
| euckr              | EUC-KR Korean             |
| gb2312             | GB2312 Simplified Chinese |
| gbk                | GBK Simplified Chinese    |
| sjis               | Shift-JIS Japanese        |
| ujis               | EUC-JP Japanese           |
+--------------------+---------------------------+
8 rows in set (0.01 sec)
```

(See Section 19.1, “The `INFORMATION_SCHEMA CHARACTER_SETS` Table”, for more information.)

MySQL supports the two common variants of the *GB* (*Guojia Biaozhun*, or *National Standard*, or *Simplified Chinese*) character sets which are official in the People's Republic of China: `gb2312` and `gbk`. Sometimes people try to insert `gbk` characters into `gb2312`, and it works most of the time because `gbk` is a superset of `gb2312`—but eventually they try to insert a rarer Chinese character and it doesn't work. (See Bug #16072 for an example).

Here, we try to clarify exactly what characters are legitimate in `gb2312` or `gbk`, with reference to the official documents. Please check these references before reporting `gb2312` or `gbk` bugs.

- For a complete listing of the `gb2312` characters, ordered according to the `gb2312_chinese_ci` collation: gb2312
- MySQL's `gbk` is in reality “Microsoft code page 936”. This differs from the official `gbk` for characters `A1A4` (middle dot), `A1AA` (em dash), `A6E0-A6F5`, and `A8BB-A8C0`.
- For a listing of `gbk`/Unicode mappings, see http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT.

- For MySQL's listing of `gbk` characters, see gbk.

B.11.2: I have inserted CJK characters into my table. Why does `SELECT` display them as "?" characters?

This problem is usually due to a setting in MySQL that doesn't match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:

- *Be certain of what MySQL version you are using.*

  Use the statement `SELECT VERSION();` to determine this.

- *Make sure that the database is actually using the desired character set.*

  People often think that the client character set is always the same as either the server character set or the character set used for display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or—better yet—by using this statement:

```
SELECT character_set_name, collation_name
    FROM information_schema.columns
    WHERE table_schema = your_database_name
        AND table_name = your_table_name
        AND column_name = your_column_name;
```

- *Determine the hexadecimal value of the character or characters that are not being displayed correctly.*

  You can obtain this information for a column `column_name` in the table `table_name` using the following query:

```
SELECT HEX(column_name)
FROM table_name;
```

  `3F` is the encoding for the `?` character; this means that `?` is the character actually stored in the column. This most often happens because of a problem converting a particular character from your client character set to the target character set.

- *Make sure that a round trip possible—that is, when you select `literal` (or `_introducer hexadecimal-value`), you obtain `literal` as a result.*

  For example, the Japanese *Katakana* character *Pe* (ペ) exists in all CJK character sets, and has the code point value (hexadecimal coding) `0x30da`. To test a round trip for this character, use this query:

```
SELECT 'ペ' AS `ペ`;         /* or SELECT _ucs2 0x30da; */
```

  If the result is not also ペ, then the round trip has failed.

  For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX('ペ');`. Then we can determine whether the client encoding is correct.

- *Make sure that the problem is not with the browser or other application, rather than with MySQL.*

  Use the `mysql` client program (on Windows: `mysql.exe`) to accomplish this task. If `mysql` displays correctly but your application doesn't, then your problem is probably due to system settings.

  To find out what your settings are, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

```
mysql> SHOW VARIABLES LIKE 'char%';
+--------------------------+---------------------------------------+
| Variable_name            | Value                                 |
+--------------------------+---------------------------------------+
| character_set_client     | utf8                                  |
| character_set_connection | utf8                                  |
| character_set_database   | latin1                                |
| character_set_filesystem | binary                                |
| character_set_results    | utf8                                  |
| character_set_server     | latin1                                |
| character_set_system     | utf8                                  |
| character_sets_dir       | /usr/local/mysql/share/mysql/charsets/ |
+--------------------------+---------------------------------------+
8 rows in set (0.03 sec)
```

  These are typical character-set settings for an international-oriented client (notice the use of `utf8` Unicode) connected to a server in the West (`latin1` is a West Europe character set and a default for MySQL).

  Although Unicode (usually the `utf8` variant on Unix, and the `ucs2` variant on Windows) is preferable to Latin, it is often not

what your operating system utilities support best. Many Windows users find that a Microsoft character set, such as `cp932` for Japanese Windows, is suitable.

If you cannot control the server settings, and you have no idea what your underlying computer is, then try changing to a common character set for the country that you're in (`euckr` = Korea; `gb2312` or `gbk` = People's Republic of China; `big5` = Taiwan; `sjis`, `ujis`, `cp932`, or `eucjpms` = Japan; `ucs2` or `utf8` = anywhere). Usually it is necessary to change only the client and connection and results settings. There is a simple statement which changes all three at once: `SET NAMES`. For example:

```
SET NAMES 'big5';
```

Once the setting is correct, you can make it permanent by editing `my.cnf` or `my.ini`. For example you might add lines looking like these:

```
[mysqld]
character-set-server=big5
[client]
default-character-set=big5
```

It is also possible that there are issues with the API configuration setting being used in your application; see *Why does my GUI front end or browser not display CJK characters correctly...?* for more information.

B.11.3: What problems should I be aware of when working with the Big5 Chinese character set?

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). MySQL's `big5` is in reality Microsoft code page 950, which is very similar to the original `big5` character set. We changed to this character set starting with MySQL version 4.1.16 / 5.0.16 (as a result of Bug #12476). For example, the following statements work in current versions of MySQL, but not in old versions:

```
mysql> CREATE TABLE big5 (BIG5 CHAR(1) CHARACTER SET BIG5);
Query OK, 0 rows affected (0.13 sec)

mysql> INSERT INTO big5 VALUES (0xf9dc);
Query OK, 1 row affected (0.00 sec)

mysql> SELECT * FROM big5;
+------+
| big5 |
+------+
| 嫺   |
+------+
1 row in set (0.02 sec)
```

A feature request for adding `HKSCS` extensions has been filed. People who need this extension may find the suggested patch for Bug #13577 to be of interest.

B.11.4: Why do Japanese character set conversions fail?

MySQL supports the `sjis`, `ujis`, `cp932`, and `eucjpms` character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with `sjis` or `ujis`) and a Windows client (typically with `cp932`).

In the following conversion table, the `ucs2` column represents the source, and the `sjis`, `cp932`, `ujis`, and `eucjpms` columns represent the destinations—that is, the last 4 columns provide the hexadecimal result when we use `CONVERT(ucs2)` or we assign a `ucs2` column containing the value to an `sjis`, `cp932`, `ujis`, or `eucjpms` column.

Character Name	ucs2	sjis	cp932	ujis	eucjpms
BROKEN BAR	00A6	3F	3F	8FA2C3	3F
FULLWIDTH BROKEN BAR	FFE4	3F	FA55	3F	8FA2
YEN SIGN	00A5	3F	3F	20	3F
FULLWIDTH YEN SIGN	FFE5	818F	818F	A1EF	3F
TILDE	007E	7E	7E	7E	7E
OVERLINE	203E	3F	3F	20	3F
HORIZONTAL BAR	2015	815C	815C	A1BD	A1BD
EM DASH	2014	3F	3F	3F	3F
REVERSE SOLIDUS	005C	815F	5C	5C	5C
FULLWIDTH ""	FF3C	3F	815F	3F	A1C0

Character Name	ucs2	sjis	cp932	ujis	eucjpms
WAVE DASH	301C	8160	3F	A1C1	3F
FULLWIDTH TILDE	FF5E	3F	8160	3F	A1C1
DOUBLE VERTICAL LINE	2016	8161	3F	A1C2	3F
PARALLEL TO	2225	3F	8161	3F	A1C2
MINUS SIGN	2212	817C	3F	A1DD	3F
FULLWIDTH HYPHEN-MINUS	FF0D	3F	817C	3F	A1DD
CENT SIGN	00A2	8191	3F	A1F1	3F
FULLWIDTH CENT SIGN	FFE0	3F	8191	3F	A1F1
POUND SIGN	00A3	8192	3F	A1F2	3F
FULLWIDTH POUND SIGN	FFE1	3F	8192	3F	A1F2
NOT SIGN	00AC	81CA	3F	A2CC	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA	3F	A2CC

Now consider the following portion of the table.

	ucs2	sjis	cp932
NOT SIGN	00AC	81CA	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA

This means that MySQL converts the `NOT SIGN` (Unicode `U+00AC`) to `sjis` code point `0x81CA` and to `cp932` code point `3F`. (`3F` is the question mark (“?”)—this is what is always used when the conversion cannot be performed.

B.11.5: What should I do if I want to convert SJIS `81CA` to `cp932`?

Our answer is: “?”. There are serious complaints about this: many people would prefer a “loose” conversion, so that `81CA (NOT SIGN)` in `sjis` becomes `81CA (FULLWIDTH NOT SIGN)` in `cp932`. We are considering a change to this behavior.

B.11.6: How does MySQL represent the Yen (`¥`) sign?

A problem arises because some versions of Japanese character sets (both `sjis` and `euc`) treat `5C` as a *reverse solidus* (`\`—also known as a backslash), and others treat it as a yen sign (`¥`).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, *`5C` is always the reverse solidus (`\`)*.

B.11.7: Does MySQL plan to make a separate character set where `5C` is the Yen sign, as at least one other major DBMS does?

This is one possible solution to the Yen sign issue; however, this will not happen in MySQL 5.1 or 6.0.

B.11.8: Of what issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the `euckr` (*Extended Unix Code Korea*) character set, only one problem has been noted.

We use the “ASCII” variant of EUC-KR, in which the code point `0x5c` is REVERSE SOLIDUS, that is `\`, instead of the “KS-Roman” variant of EUC-KR, in which the code point `0x5c` is `WON SIGN`(`₩`). This means that you cannot convert Unicode `U+20A9` to `euckr`:

```
mysql> SELECT
    ->     CONVERT('₩' USING euckr) AS euckr,
    ->     HEX(CONVERT('₩' USING euckr)) AS hexeuckr;
+-------+----------+
| euckr | hexeuckr |
+-------+----------+
| ?     | 3F       |
+-------+----------+
1 row in set (0.00 sec)
```

MySQL's graphic Korean chart is here: euckr.

B.11.9: Why do I get `INCORRECT STRING VALUE` error messages?

For illustration, we'll create a table with one Unicode (`ucs2`) column and one Chinese (`gb2312`) column.

```
mysql> CREATE TABLE ch
    -> (ucs2 CHAR(3) CHARACTER SET ucs2,
    -> gb2312 CHAR(3) CHARACTER SET gb2312);
Query OK, 0 rows affected (0.05 sec)
```

We'll try to place the rare character 汃 in both columns.

```
mysql> INSERT INTO ch VALUES ('A汃B','A汃B');
Query OK, 1 row affected, 1 warning (0.00 sec)
```

Ah, there is a warning. Use the following statement to see what it is:

```
mysql> SHOW WARNINGS\G
*************************** 1. row ***************************
  Level: Warning
   Code: 1366
Message: Incorrect string value: '\xE6\xB1\x8CB' for column 'gb2312' at row 1
1 row in set (0.00 sec)
```

So it is a warning about the `gb2312` column only.

```
mysql> SELECT ucs2,HEX(ucs2),gb2312,HEX(gb2312) FROM ch;
+-------+--------------+--------+-------------+
| ucs2  | HEX(ucs2)    | gb2312 | HEX(gb2312) |
+-------+--------------+--------+-------------+
| A汃B | 00416C4C0042 | A?B    | 413F42      |
+-------+--------------+--------+-------------+
1 row in set (0.00 sec)
```

Several things need explanation here:

1. The fact that it is a “warning” rather than an “error” is characteristic of MySQL. We like to try to do what we can, to get the best fit, rather than give up.
2. The 汃 character is not in the `gb2312` character set. We described that problem earlier.
3. If you are using an old version of MySQL, you will probably see a different message.
4. With `sql_mode=TRADITIONAL`, there would be an error message, rather than a warning.

B.11.10: Why does my GUI front end or browser not display CJK characters correctly in my application using Access, PHP, or another API?

Obtain a direct connection to the server using the `mysql` client (Windows: `mysql.exe`), and try the same query there. If `mysql` responds correctly, then the trouble may be that your application interface requires initialization. Use `mysql` to tell you what character set or sets it uses with the statement `SHOW VARIABLES LIKE 'char%';`. If you are using Access, then you are most likely connecting with Connector/ODBC. In this case, you should check Section 21.1.4, “Connector/ODBC Configuration”. If, for instance, you use `big5`, you would enter `SET NAMES 'big5'`. (Note that no `;` is required in this case). If you are using ASP, you might need to add `SET NAMES` in the code. Here is an example that has worked in the past:

```
<%
Session.CodePage=0
Dim strConnection
Dim Conn
strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username;" \
              & "pwd=password;database=database;stmt=SET NAMES 'big5';"
Set Conn = Server.CreateObject("ADODB.Connection")
Conn.Open strConnection
%>
```

In much the same way, if you are using any character set other than `latin1` with Connector/Net, then you must specify the character set in the connection string. See Section 21.2.5.1, “Connecting to MySQL Using Connector/Net”, for more information.

If you are using PHP, try this:

```
<?php
  $link = mysql_connect($host, $usr, $pwd);

  mysql_select_db($db);

  if( mysql_error() ) { print "Database ERROR: " . mysql_error(); }
  mysql_query("SET NAMES 'utf8'", $link);
?>
```

In this case, we used `SET NAMES` to change `character_set_client` and `character_set_connection` and `character_set_results`.

We encourage the use of the newer `mysqli` extension, rather than `mysql`. Using `mysqli`, the previous example could be rewritten as shown here:

```
<?php
  $link = new mysqli($host, $usr, $pwd, $db);

  if( mysqli_connect_errno() )
  {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
  }

  $link->query("SET NAMES 'utf8'");
?>
```

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a `<meta>` tag suffices to correct the problem: for example, to insure that the user agent interprets page content as `UTF-8`, you should include `<meta http-equiv="Content-Type" content="text/html; charset=utf-8">` in the `<head>` of the HTML page.

If you are using Connector/J, see Section 21.3.5.4, “Using Character Sets and Unicode”.

B.11.11: I've upgraded to MySQL 5.5. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single “global” character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a “handshake”, as described in Section 9.1.4, “Connection Character Sets and Collations”:

> When a client connects, it sends to the server the name of the character set that it wants to use. The server uses the name to set the `character_set_client`, `character_set_results`, and `character_set_connection` system variables. In effect, the server performs a `SET NAMES` operation using the character set name.

The effect of this is that you cannot control the client character set by starting `mysqld` with `--character-set-server=utf8`. However, some of our Asian customers have said that they prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a `mysqld` switch, `--character-set-client-handshake`, which can be turned off with `--skip-character-set-client-handshake`. If you start `mysqld` with `--skip-character-set-client-handshake`, then, when a client connects, it sends to the server the name of the character set that it wants to use—however, *the server ignores this request from the client*.

By way of example, suppose that your favorite server character set is `latin1` (unlikely in a CJK area, but this is the default value). Suppose further that the client uses `utf8` because this is what the client's operating system supports. Now, start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The current settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
+--------------------------+----------------------------------------+
| Variable_name            | Value                                  |
+--------------------------+----------------------------------------+
| character_set_client     | utf8                                   |
| character_set_connection | utf8                                   |
| character_set_database   | latin1                                 |
| character_set_filesystem | binary                                 |
| character_set_results    | utf8                                   |
| character_set_server     | latin1                                 |
| character_set_system     | utf8                                   |
| character_sets_dir       | /usr/local/mysql/share/mysql/charsets/ |
+--------------------------+----------------------------------------+
8 rows in set (0.01 sec)
```

Now stop the client, and then stop the server using `mysqladmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```

Start the client with `utf8` once again as the default character set, then display the current settings:

```
mysql> SHOW VARIABLES LIKE 'char%';
+--------------------------+----------------------------------------+
| Variable_name            | Value                                  |
+--------------------------+----------------------------------------+
| character_set_client     | latin1                                 |
| character_set_connection | latin1                                 |
| character_set_database   | latin1                                 |
| character_set_filesystem | binary                                 |
| character_set_results    | latin1                                 |
| character_set_server     | latin1                                 |
| character_set_system     | utf8                                   |
| character_sets_dir       | /usr/local/mysql/share/mysql/charsets/ |
+--------------------------+----------------------------------------+
8 rows in set (0.01 sec)
```

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client's initial settings if the `--skip-character-set-client-handshake` is used.

B.11.12: Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?

There is a very simple problem with `LIKE` searches on `BINARY` and `BLOB` columns: we need to know the end of a character. With multi-byte character sets, different characters might have different octet lengths. For example, in `utf8`, `A` requires one byte but 𠜎 requires three bytes, as shown here:

```
+-------------------------+--------------------------+
| OCTET_LENGTH(_utf8 'A') | OCTET_LENGTH(_utf8 '𠜎') |
+-------------------------+--------------------------+
|                       1 |                        3 |
+-------------------------+--------------------------+
1 row in set (0.00 sec)
```

If we don't know where the first character ends, then we don't know where the second character begins, in which case even very simple searches such as `LIKE '_A%'` fail. The solution is to use a regular CJK character set in the first place, or to convert to a CJK character set before comparing.

This is one reason why MySQL cannot allow encodings of nonexistent characters. If it is not strict about rejecting bad input, then it has no way of knowing where characters end.

For `FULLTEXT` searches, we need to know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary—the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a comprehensive word list, which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

B.11.13: How do I know whether character *`X`* is available in all character sets?

The majority of simplified Chinese and basic nonhalfwidth Japanese *Kana* characters appear in all CJK character sets. This stored procedure accepts a `UCS-2` Unicode character, converts it to all other character sets, and displays the results in hexadecimal.

```
DELIMITER //

CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN

CREATE TABLE tj
             (ucs2 CHAR(1) character set ucs2,
              utf8 CHAR(1) character set utf8,
              big5 CHAR(1) character set big5,
              cp932 CHAR(1) character set cp932,
              eucjpms CHAR(1) character set eucjpms,
              euckr CHAR(1) character set euckr,
              gb2312 CHAR(1) character set gb2312,
              gbk CHAR(1) character set gbk,
              sjis CHAR(1) character set sjis,
              ujis CHAR(1) character set ujis);

INSERT INTO tj (ucs2) VALUES (ucs2_char);

UPDATE tj SET utf8=ucs2,
              big5=ucs2,
              cp932=ucs2,
              eucjpms=ucs2,
              euckr=ucs2,
              gb2312=ucs2,
              gbk=ucs2,
              sjis=ucs2,
              ujis=ucs2;

/* If there is a conversion problem, UPDATE will produce a warning. */
```

```
SELECT hex(ucs2) AS ucs2,
       hex(utf8) AS utf8,
       hex(big5) AS big5,
       hex(cp932) AS cp932,
       hex(eucjpms) AS eucjpms,
       hex(euckr) AS euckr,
       hex(gb2312) AS gb2312,
       hex(gbk) AS gbk,
       hex(sjis) AS sjis,
       hex(ujis) AS ujis
FROM tj;

DROP TABLE tj;

END//
```

The input can be any single `ucs2` character, or it can be the code point value (hexadecimal representation) of that character. For example, from Unicode's list of `ucs2` encodings and names (http://www.unicode.org/Public/UNIDATA/UnicodeData.txt), we know that the *Katakana* character *Pe* appears in all CJK character sets, and that its code point value is `0x30da`. If we use this value as the argument to `p_convert()`, the result is as shown here:

```
mysql> CALL p_convert(0x30da)//
+------+--------+------+-------+---------+-------+--------+------+------+------+
| ucs2 | utf8   | big5 | cp932 | eucjpms | euckr | gb2312 | gbk  | sjis | ujis |
+------+--------+------+-------+---------+-------+--------+------+------+------+
| 30DA | E3839A | C772 | 8379  | A5DA    | ABDA  | A5DA   | A5DA | 8379 | A5DA |
+------+--------+------+-------+---------+-------+--------+------+------+------+
1 row in set (0.04 sec)
```

Since none of the column values is `3F`—that is, the question mark character (`?`)—we know that every conversion worked.

B.11.14: Why do CJK strings sort incorrectly in Unicode? (I)

Sometimes people observe that the result of a `utf8_unicode_ci` or `ucs2_unicode_ci` search, or of an `ORDER BY` sort is not what they think a native would expect. Although we never rule out the possibility that there is a bug, we have found in the past that many people do not read correctly the standard table of weights for the Unicode Collation Algorithm. MySQL uses the table found at http://www.unicode.org/Public/UCA/4.0.0/allkeys-4.0.0.txt. This is not the first table you will find by navigating from the `unicode.org` home page, because MySQL uses the older 4.0.0 “allkeys” table, rather than the more recent 4.1.0 table. (The newer `'520'` collations in MySQL 5.6 use the 5.2 “allkeys” table.) This is because we are very wary about changing ordering which affects indexes, lest we bring about situations such as that reported in Bug #16526, illustrated as follows:

```
mysql< CREATE TABLE tj (s1 CHAR(1) CHARACTER SET utf8 COLLATE utf8_unicode_ci);
Query OK, 0 rows affected (0.05 sec)

mysql> INSERT INTO tj VALUES ('が'),('か');
Query OK, 2 rows affected (0.00 sec)
Records: 2  Duplicates: 0  Warnings: 0

mysql> SELECT * FROM tj WHERE s1 = 'か';
+------+
| s1   |
+------+
| が   |
| か   |
+------+
2 rows in set (0.00 sec)
```

The character in the first result row is not the one that we searched for. Why did MySQL retrieve it? First we look for the Unicode code point value, which is possible by reading the hexadecimal number for the `ucs2` version of the characters:

```
mysql> SELECT s1, HEX(CONVERT(s1 USING ucs2)) FROM tj;
+------+-----------------------------+
| s1   | HEX(CONVERT(s1 USING ucs2)) |
+------+-----------------------------+
| が   | 304C                        |
| か   | 304B                        |
+------+-----------------------------+
2 rows in set (0.03 sec)
```

Now we search for `304B` and `304C` in the `4.0.0 allkeys` table, and find these lines:

```
304B  ; [.1E57.0020.000E.304B] # HIRAGANA LETTER KA
304C  ; [.1E57.0020.000E.304B][.0000.0140.0002.3099] # HIRAGANA LETTER GA; QQCM
```

The official Unicode names (following the “#” mark) tell us the Japanese syllabary (Hiragana), the informal classification (letter, digit, or punctuation mark), and the Western identifier (`KA` or `GA`, which happen to be voiced and unvoiced components of the same letter pair). More importantly, the *primary weight* (the first hexadecimal number inside the square brackets) is `1E57` on both lines. For comparisons in both searching and sorting, MySQL pays attention to the primary weight only, ignoring all the other numbers. This means that we are sorting が and か correctly according to the Unicode specification. If we wanted to distinguish them, we'd have to use a non-UCA (Unicode Collation Algorithm) collation (`utf8_bin` or `utf8_general_ci`), or to compare the `HEX()`

values, or use `ORDER BY CONVERT(s1 USING sjis)`. Being correct "according to Unicode" isn't enough, of course: the person who submitted the bug was equally correct. We plan to add another collation for Japanese according to the JIS X 4061 standard, in which voiced/unvoiced letter pairs like `KA`/`GA` are distinguishable for ordering purposes.

B.11.15: Why do CJK strings sort incorrectly in Unicode? (II)

If you are using Unicode (`ucs2` or `utf8`), and you know what the Unicode sort order is (see Section B.11, "MySQL 5.5 FAQ: MySQL Chinese, Japanese, and Korean Character Sets"), but MySQL still seems to sort your table incorrectly, then you should first verify the table character set:

```
mysql> SHOW CREATE TABLE t\G
*************************** 1. row ***************************
Table: t
Create Table: CREATE TABLE `t` (
`s1` char(1) CHARACTER SET ucs2 DEFAULT NULL
) ENGINE=MyISAM DEFAULT CHARSET=latin1
1 row in set (0.00 sec)
```

Since the character set appears to be correct, let's see what information the `INFORMATION_SCHEMA.COLUMNS` table can provide about this column:

```
mysql> SELECT COLUMN_NAME, CHARACTER_SET_NAME, COLLATION_NAME
    -> FROM INFORMATION_SCHEMA.COLUMNS
    -> WHERE COLUMN_NAME = 's1'
    -> AND TABLE_NAME = 't';
+-------------+--------------------+-----------------+
| COLUMN_NAME | CHARACTER_SET_NAME | COLLATION_NAME  |
+-------------+--------------------+-----------------+
| s1          | ucs2               | ucs2_general_ci |
+-------------+--------------------+-----------------+
1 row in set (0.01 sec)
```

(See Section 19.4, "The `INFORMATION_SCHEMA COLUMNS` Table", for more information.)

You can see that the collation is `ucs2_general_ci` instead of `ucs2_unicode_ci`. The reason why this is so can be found using `SHOW CHARSET`, as shown here:

```
mysql> SHOW CHARSET LIKE 'ucs2%';
+---------+--------------+-------------------+--------+
| Charset | Description  | Default collation | Maxlen |
+---------+--------------+-------------------+--------+
| ucs2    | UCS-2 Unicode | ucs2_general_ci   |      2 |
+---------+--------------+-------------------+--------+
1 row in set (0.00 sec)
```

For `ucs2` and `utf8`, the default collation is "general". To specify a Unicode collation, use `COLLATE ucs2_unicode_ci`.

B.11.16: Why are my supplementary characters rejected by MySQL?

Before MySQL 5.5.3, MySQL does not support supplementary characters—that is, characters which need more than 3 bytes—for `UTF-8`. We support only what Unicode calls the *Basic Multilingual Plane / Plane 0*. Only a few very rare Han characters are supplementary; support for them is uncommon. This has led to reports such as that found in Bug #12600, which we rejected as "not a bug". With `utf8`, we must truncate an input string when we encounter bytes that we don't understand. Otherwise, we wouldn't know how long the bad multi-byte character is.

One possible workaround is to use `ucs2` instead of `utf8`, in which case the "bad" characters are changed to question marks; however, no truncation takes place. You can also change the data type to `BLOB` or `BINARY`, which perform no validity checking.

As of MySQL 5.5.3, Unicode support is extended to include supplementary characters by means of additional Unicode character sets: `utf16`, `utf32`, and 4-byte `utf8mb4`. These character sets support supplementary Unicode characters outside the Basic Multilingual Plane (BMP).

B.11.17: Shouldn't it be "CJKV"?

No. The term "CJKV" (*Chinese Japanese Korean Vietnamese*) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL has no plan to support the old Vietnamese script using Han characters. MySQL does of course support the modern Vietnamese script with Western characters.

As of MySQL 5.6, there are Vietnamese collations for Unicode character sets, as described in Section 9.1.14.1, "Unicode Character Sets".

B.11.18: Does MySQL allow CJK characters to be used in database and table names?

This issue is fixed in MySQL 5.1, by automatically rewriting the names of the corresponding directories and files.

For example, if you create a database named 楮 on a server whose operating system does not support CJK in directory names,

MySQL creates a directory named `@0w@00a5@00ae`. which is just a fancy way of encoding `E6A5AE`—that is, the Unicode hexadecimal representation for the 楮 character. However, if you run a `SHOW DATABASES` statement, you can see that the database is listed as 楮.

B.11.19: Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?

A Simplified Chinese version of the Manual, current for MySQL 5.1.12, can be found at http://dev.mysql.com/doc/. The Japanese translation of the MySQL 4.1 manual can be downloaded from http://dev.mysql.com/doc/.

B.11.20: Where can I get help with CJK and related issues in MySQL?

The following resources are available:

- A listing of MySQL user groups can be found at http://dev.mysql.com/user-groups/.
- View feature requests relating to character set issues at http://tinyurl.com/y6xcuf.
- Visit the MySQL Character Sets, Collation, Unicode Forum. We are also in the process of adding foreign-language forums at http://forums.mysql.com/.

B.12. MySQL 5.5 FAQ: Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- Section 21.9.11, “Common Questions and Problems When Using the C API”
- Section 21.10.6, “Common Problems with MySQL and PHP”
- Section 21.1.7, “Connector/ODBC Notes and Tips”
- Section 21.2.5, “Connector/Net Programming”
- Section 21.3, “MySQL Connector/J”
- Section 21.4.6, “Connector/MXJ Notes and Tips”

B.13. MySQL 5.5 FAQ: Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication.

Questions

- B.13.1: Must the slave be connected to the master all the time?
- B.13.2: Must I enable networking on my master and slave to enable replication?
- B.13.3: How do I know how late a slave is compared to the master? In other words, how do I know the date of the last statement replicated by the slave?
- B.13.4: How do I force the master to block updates until the slave catches up?
- B.13.5: What issues should I be aware of when setting up two-way replication?
- B.13.6: How can I use replication to improve performance of my system?
- B.13.7: What should I do to prepare client code in my own applications to use performance-enhancing replication?
- B.13.8: When and how much can MySQL replication improve the performance of my system?
- B.13.9: How can I use replication to provide redundancy or high availability?
- B.13.10: How do I tell whether a master server is using statement-based or row-based binary logging format?
- B.13.11: How do I tell a slave to use row-based replication?

- B.13.12: How do I prevent `GRANT` and `REVOKE` statements from replicating to slave machines?
- B.13.13: Does replication work on mixed operating systems (for example, the master runs on Linux while slaves run on Mac OS X and Windows)?
- B.13.14: Does replication work on mixed hardware architectures (for example, the master runs on a 64-bit machine while slaves run on 32-bit machines)?

Questions and Answers

B.13.1: Must the slave be connected to the master all the time?

No, it does not. The slave can go down or stay disconnected for hours or even days, and then reconnect and catch up on updates. For example, you can set up a master/slave relationship over a dial-up link where the link is up only sporadically and for short periods of time. The implication of this is that, at any given time, the slave is not guaranteed to be in synchrony with the master unless you take some special measures.

To ensure that catchup can occur for a slave that has been disconnected, you must not remove binary log files from the master that contain information that has not yet been replicated to the slaves. Asynchronous replication can work only if the slave is able to continue reading the binary log from the point where it last read events.

B.13.2: Must I enable networking on my master and slave to enable replication?

Yes, networking must be enabled on the master and slave. If networking is not enabled, the slave cannot connect to the master and transfer the binary log. Check that the `skip-networking` option has not been enabled in the configuration file for either server.

B.13.3: How do I know how late a slave is compared to the master? In other words, how do I know the date of the last statement replicated by the slave?

Check the `Seconds_Behind_Master` column in the output from `SHOW SLAVE STATUS`. See Section 15.1.4.1, “Checking Replication Status”.

When the slave SQL thread executes an event read from the master, it modifies its own time to the event timestamp. (This is why `TIMESTAMP` is well replicated.) In the `Time` column in the output of `SHOW PROCESSLIST`, the number of seconds displayed for the slave SQL thread is the number of seconds between the timestamp of the last replicated event and the real time of the slave machine. You can use this to determine the date of the last replicated event. Note that if your slave has been disconnected from the master for one hour, and then reconnects, you may immediately see large `Time` values such as 3600 for the slave SQL thread in `SHOW PROCESSLIST`. This is because the slave is executing statements that are one hour old. See Section 15.2.1, “Replication Implementation Details”.

B.13.4: How do I force the master to block updates until the slave catches up?

Use the following procedure:

1. On the master, execute these statements:

   ```
   mysql> FLUSH TABLES WITH READ LOCK;
   mysql> SHOW MASTER STATUS;
   ```

   Record the replication coordinates (the current binary log file name and position) from the output of the `SHOW` statement.

2. On the slave, issue the following statement, where the arguments to the `MASTER_POS_WAIT()` function are the replication coordinate values obtained in the previous step:

   ```
   mysql> SELECT MASTER_POS_WAIT('log_name', log_pos);
   ```

   The `SELECT` statement blocks until the slave reaches the specified log file and position. At that point, the slave is in synchrony with the master and the statement returns.

3. On the master, issue the following statement to enable the master to begin processing updates again:

   ```
   mysql> UNLOCK TABLES;
   ```

B.13.5: What issues should I be aware of when setting up two-way replication?

MySQL replication currently does not support any locking protocol between master and slave to guarantee the atomicity of a distributed (cross-server) update. In other words, it is possible for client A to make an update to co-master 1, and in the meantime, be-

fore it propagates to co-master 2, client B could make an update to co-master 2 that makes the update of client A work differently than it did on co-master 1. Thus, when the update of client A makes it to co-master 2, it produces tables that are different from what you have on co-master 1, even after all the updates from co-master 2 have also propagated. This means that you should not chain two servers together in a two-way replication relationship unless you are sure that your updates can safely happen in any order, or unless you take care of mis-ordered updates somehow in the client code.

You should also realize that two-way replication actually does not improve performance very much (if at all) as far as updates are concerned. Each server must do the same number of updates, just as you would have a single server do. The only difference is that there is a little less lock contention because the updates originating on another server are serialized in one slave thread. Even this benefit might be offset by network delays.

B.13.6: How can I use replication to improve performance of my system?

Set up one server as the master and direct all writes to it. Then configure as many slaves as you have the budget and rackspace for, and distribute the reads among the master and the slaves. You can also start the slaves with the `--skip-innodb`, `--low-priority-updates`, and `--delay-key-write=ALL` options to get speed improvements on the slave end. In this case, the slave uses nontransactional `MyISAM` tables instead of `InnoDB` tables to get more speed by eliminating transactional overhead.

B.13.7: What should I do to prepare client code in my own applications to use performance-enhancing replication?

See the guide to using replication as a scale-out solution, Section 15.3.3, “Using Replication for Scale-Out”.

B.13.8: When and how much can MySQL replication improve the performance of my system?

MySQL replication is most beneficial for a system that processes frequent reads and infrequent writes. In theory, by using a single-master/multiple-slave setup, you can scale the system by adding more slaves until you either run out of network bandwidth, or your update load grows to the point that the master cannot handle it.

To determine how many slaves you can use before the added benefits begin to level out, and how much you can improve performance of your site, you must know your query patterns, and determine empirically by benchmarking the relationship between the throughput for reads and writes on a typical master and a typical slave. The example here shows a rather simplified calculation of what you can get with replication for a hypothetical system. Let `reads` and `writes` denote the number of reads and writes per second, respectively.

Let's say that system load consists of 10% writes and 90% reads, and we have determined by benchmarking that `reads` is 1200 - 2 * `writes`. In other words, the system can do 1,200 reads per second with no writes, the average write is twice as slow as the average read, and the relationship is linear. Suppose that the master and each slave have the same capacity, and that we have one master and *N* slaves. Then we have for each server (master or slave):

`reads` = 1200 - 2 * `writes`

`reads` = 9 * `writes` / (*N* + 1) (reads are split, but writes replicated to all slaves)

9 * `writes` / (*N* + 1) + 2 * `writes` = 1200

`writes` = 1200 / (2 + 9/(*N* + 1))

The last equation indicates the maximum number of writes for *N* slaves, given a maximum possible read rate of 1,200 per minute and a ratio of nine reads per write.

This analysis yields the following conclusions:

- If *N* = 0 (which means we have no replication), our system can handle about 1200/11 = 109 writes per second.
- If *N* = 1, we get up to 184 writes per second.
- If *N* = 8, we get up to 400 writes per second.
- If *N* = 17, we get up to 480 writes per second.
- Eventually, as *N* approaches infinity (and our budget negative infinity), we can get very close to 600 writes per second, increasing system throughput about 5.5 times. However, with only eight servers, we increase it nearly four times.

Note that these computations assume infinite network bandwidth and neglect several other factors that could be significant on your system. In many cases, you may not be able to perform a computation similar to the one just shown that accurately predicts what will happen on your system if you add *N* replication slaves. However, answering the following questions should help you decide whether and by how much replication will improve the performance of your system:

- What is the read/write ratio on your system?
- How much more write load can one server handle if you reduce the reads?
- For how many slaves do you have bandwidth available on your network?

B.13.9: How can I use replication to provide redundancy or high availability?

How you implement redundancy is entirely dependent on your application and circumstances. High-availability solutions (with automatic failover) require active monitoring and either custom scripts or third party tools to provide the failover support from the original MySQL server to the slave.

To handle the process manually, you should be able to switch from a failed master to a pre-configured slave by altering your application to talk to the new server or by adjusting the DNS for the MySQL server from the failed server to the new server.

For more information and some example solutions, see Section 15.3.6, “Switching Masters During Failover”.

B.13.10: How do I tell whether a master server is using statement-based or row-based binary logging format?

Check the value of the `binlog_format` system variable:

```
mysql> SHOW VARIABLES LIKE 'binlog_format';
```

The value shown will be one of `STATEMENT`, `ROW`, or `MIXED`. For `MIXED` mode, row-based logging is preferred but replication switches automatically to statement-based logging under certain conditions; for information about when this may occur, see Section 5.2.4.3, “Mixed Binary Logging Format”.

B.13.11: How do I tell a slave to use row-based replication?

Slaves automatically know which format to use.

B.13.12: How do I prevent `GRANT` and `REVOKE` statements from replicating to slave machines?

Start the server with the `--replicate-wild-ignore-table=mysql.%` option to ignore replication for tables in the `mysql` database.

B.13.13: Does replication work on mixed operating systems (for example, the master runs on Linux while slaves run on Mac OS X and Windows)?

Yes.

B.13.14: Does replication work on mixed hardware architectures (for example, the master runs on a 64-bit machine while slaves run on 32-bit machines)?

Yes.

B.14. MySQL 5.5 FAQ: MySQL, DRBD, and Heartbeat

B.14.1. Distributed Replicated Block Device (DRBD)

In the following section, we provide answers to questions that are most frequently asked about Distributed Replicated Block Device (DRBD).

Questions

- B.14.1.1: What is DRBD?
- B.14.1.2: What are “Block Devices”?
- B.14.1.3: How is DRBD licensed?
- B.14.1.4: Where can I download DRBD?
- B.14.1.5: If I find a bug in DRBD, to whom do I submit the issue?
- B.14.1.6: Where can I get more technical and business information concerning MySQL and DRBD?

Questions and Answers

B.14.1.1: What is DRBD?

DRBD is an acronym for Distributed Replicated Block Device. DRBD is an open source Linux kernel block device which leverages synchronous replication to achieve a consistent view of data between two systems, typically an Active and Passive system. DRBD currently supports all the major flavors of Linux and comes bundled in several major Linux distributions. The DRBD project is maintained by LINBIT.

B.14.1.2: What are “Block Devices”?

A *block device* is the type of device used to represent storage in the Linux Kernel. All physical disk devices present a block device interface. Additionally, virtual disk systems like LVM or DRBD present a block device interface. In this way, the file system or other software that might want to access a disk device can be used with any number of real or virtual devices without having to know anything about their underlying implementation details.

B.14.1.3: How is DRBD licensed?

DRBD is licensed under the GPL.

B.14.1.4: Where can I download DRBD?

Please see http://www.drbd.org/download/packages/.

B.14.1.5: If I find a bug in DRBD, to whom do I submit the issue?

Bug reports should be submitted to the DRBD mailing list. Please see http://lists.linbit.com/.

B.14.1.6: Where can I get more technical and business information concerning MySQL and DRBD?

Please visit http://mysql.com/drbd/.

B.14.2. Linux Heartbeat

In the following section, we provide answers to questions that are most frequently asked about Linux Heartbeat.

Questions

- B.14.2.1: How is Linux Heartbeat licensed?
- B.14.2.2: Where can I download Linux Heartbeat?
- B.14.2.3: If I find a bug with Linux Heartbeat, to whom do I submit the issue?

Questions and Answers

B.14.2.1: How is Linux Heartbeat licensed?

Linux Heartbeat is licensed under the GPL.

B.14.2.2: Where can I download Linux Heartbeat?

Please see http://linux-ha.org/download/index.html.

B.14.2.3: If I find a bug with Linux Heartbeat, to whom do I submit the issue?

Bug reports should be submitted to http://www.linux-ha.org/ClusterResourceManager/BugReports.

B.14.3. DRBD Architecture

In the following section, we provide answers to questions that are most frequently asked about DRBD Architecture.

Questions

- B.14.3.1: Is an Active/Active option available for MySQL with DRBD?
- B.14.3.2: What MySQL storage engines are supported with DRBD?

- B.14.3.3: How long does a failover take?
- B.14.3.4: How long does it take to resynchronize data after a failure?
- B.14.3.5: Are there any situations where you shouldn't use DRBD?
- B.14.3.6: Are there any limitations to DRBD?
- B.14.3.7: Where can I find more information on sample architectures?

Questions and Answers

B.14.3.1: Is an Active/Active option available for MySQL with DRBD?

Currently, MySQL does not support Active/Active configurations using DRBD “out of the box”.

B.14.3.2: What MySQL storage engines are supported with DRBD?

All of the MySQL transactional storage engines are supported by DRBD, including InnoDB and Falcon. For archived or read-only data, MyISAM or Archive can also be used.

B.14.3.3: How long does a failover take?

Failover time is dependent on many things, some of which are configurable. After activating the passive host, MySQL will have to start and run a normal recovery process. If the InnoDB log files have been configured to a large size and there was heavy write traffic, this may take a reasonably long period of time. However, under normal circumstances, failover tends to take less than a minute.

B.14.3.4: How long does it take to resynchronize data after a failure?

Resynchronization time depends on how long the two machines are out of communication and how much data was written during that period of time. Resynchronization time is a function of data to be synced, network speed and disk speed. DRBD maintains a bitmap of changed blocks on the primary machine, so only those blocks that have changed will need to be transferred.

B.14.3.5: Are there any situations where you shouldn't use DRBD?

See When Not To Use DRBD.

B.14.3.6: Are there any limitations to DRBD?

See DRBD limitations (or are they?).

B.14.3.7: Where can I find more information on sample architectures?

For an example of a Heartbeat R1-compatible resource configuration involving a MySQL database backed by DRBD, see DRBD User's Guide.

For an example of the same DRBD-backed configuration for a MySQL database in a Heartbeat CRM cluster, see DRBD User's Guide.

B.14.4. DRBD and MySQL Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication Scale-out.

Questions

- B.14.4.1: What is the difference between MySQL Cluster and DRBD?
- B.14.4.2: What is the difference between MySQL Replication and DRBD?
- B.14.4.3: How can I combine MySQL Replication scale-out with DRBD?

Questions and Answers

B.14.4.1: What is the difference between MySQL Cluster and DRBD?

Both MySQL Cluster and DRBD replicate data synchronously. MySQL Cluster leverages a shared-nothing storage architecture in which the cluster can be architected beyond an Active/Passive configuration. DRBD operates at a much lower level within the

"stack", at the disk I/O level. For a comparison of various high availability features between these two options, please refer to Chapter 14, *High Availability and Scalability*.

B.14.4.2: What is the difference between MySQL Replication and DRBD?

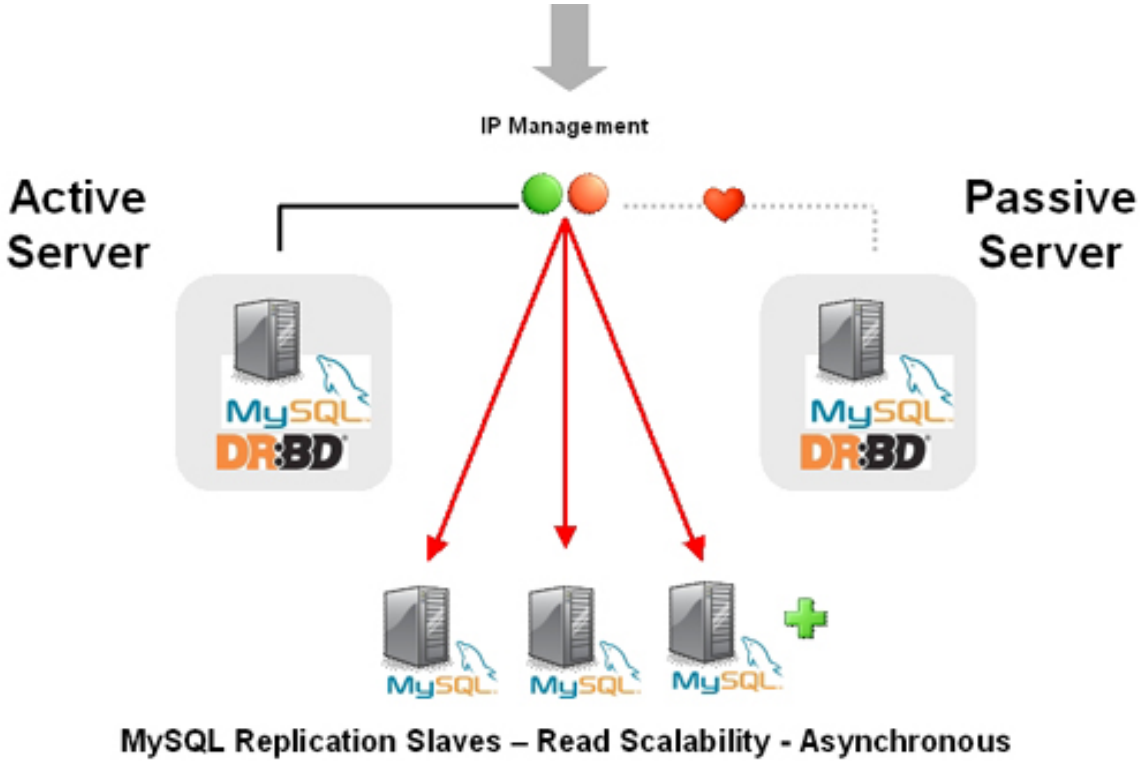
MySQL Replication replicates data asynchronously while DRBD replicates data synchronously. Also, MySQL Replication replicates MySQL statements, while DRBD replicates the underlying block device that stores the MySQL data files. For a comparison of various high availability features between these two options, please refer to the high availability comparison grid, Chapter 14, *High Availability and Scalability*.

B.14.4.3: How can I combine MySQL Replication scale-out with DRBD?

MySQL Replication is typically deployed in a Master to many Slaves configuration. In this configuration, having many Slaves provides read scalability. DRBD is used to provide high-availability for the Master MySQL Server in an Active/Passive configuration. This provides for automatic failover, safeguards against data loss, and automatically synchronizes the failed MySQL Master after a failover.

The most likely scenario in which MySQL Replication scale-out can be leveraged with DRBD is in the form of attaching replicated MySQL "read-slaves" off of the Active-Master MySQL Server. Since DRBD replicates an entire block device, master information such as the binary logs are also replicated. In this way, all of the slaves can attach to the Virtual IP Address managed by Linux Heartbeat. In the event of a failure, the asynchronous nature of MySQL Replication allows the slaves to continue with the new Active machine as their master with no intervention needed.

Figure B.1. Active-Master MySQL Server



B.14.5. DRBD and File Systems

In the following section, we provide answers to questions that are most frequently asked about DRBD and file systems.

Questions

- B.14.5.1: Can XFS be used with DRBD?

Questions and Answers

B.14.5.1: Can XFS be used with DRBD?

Yes. XFS uses dynamic block size, thus DRBD 0.7 or later is needed.

B.14.6. DRBD and LVM

In the following section, we provide answers to questions that are most frequently asked about DRBD and LVM.

Questions

- B.14.6.1: Can I use DRBD on top of LVM?
- B.14.6.2: Can I use LVM on top of DRBD?
- B.14.6.3: Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?

Questions and Answers

B.14.6.1: Can I use DRBD on top of LVM?

Yes, DRBD supports on-line resizing. If you enlarge your logical volume that acts as a backing device for DRBD, you can enlarge DRBD itself too, and of course your file system if it supports resizing.

B.14.6.2: Can I use LVM on top of DRBD?

Yes, you can use DRBD as a Physical Volume (PV) for LVM. Depending on the default LVM configuration shipped with your distribution, you may need to add the `/dev/drbd*` device files to the `filter` option in your `lvm.conf` so LVM scans your DRBDs for PV signatures.

B.14.6.3: Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?

This requires careful tuning of your LVM configuration to avoid duplicate PV scans, but yes, it is possible.

B.14.7. DRBD and Virtualization

In the following section, we provide answers to questions that are most frequently asked about DRBD and virtualization.

Questions

- B.14.7.1: Can I use DRBD with OpenVZ?
- B.14.7.2: Can I use DRBD with Xen or KVM?

Questions and Answers

B.14.7.1: Can I use DRBD with OpenVZ?

See http://wiki.openvz.org/HA_cluster_with_DRBD_and_Heartbeat.

B.14.7.2: Can I use DRBD with Xen or KVM?

Yes. If you are looking for professional consultancy or expert commercial support for Xen- or KVM-based virtualization clusters with DRBD, contact LINBIT (http://www.linbit.com).

B.14.8. DRBD and Security

In the following section, we provide answers to questions that are most frequently asked about DRBD and security.

Questions

- B.14.8.1: Can I encrypt/compress the exchanged data?
- B.14.8.2: Does DRBD do mutual node authentication?

Questions and Answers

B.14.8.1: Can I encrypt/compress the exchanged data?

Yes. But there is no option within DRBD to allow for this. You'll need to leverage a VPN and the network layer should do the rest.

B.14.8.2: Does DRBD do mutual node authentication?

Yes, starting with DRBD 8 shared-secret mutual node authentication is supported.

B.14.9. DRBD and System Requirements

In the following section, we provide answers to questions that are most frequently asked about DRBD and System Requirements.

Questions

- B.14.9.1: What other packages besides DRBD are required?
- B.14.9.2: How many machines are required to set up DRBD?
- B.14.9.3: Does DRBD only run on Linux?

Questions and Answers

B.14.9.1: What other packages besides DRBD are required?

When using pre-built binary packages, none except a matching kernel, plus packages for `glibc` and your favorite shell. When compiling DRBD from source additional prerequisite packages may be required. They include but are not limited to:

- glib-devel
- openssl
- devel
- libgcrypt-devel
- glib2-devel
- pkgconfig
- ncurses-devel
- rpm-build
- rpm-devel
- redhat-rpm-config
- gcc
- gcc-c++
- bison
- flex
- gnutls-devel
- lm_sensors-devel
- net-snmp-devel
- python-devel
- bzip2-devel
- libselinux-devel
- perl-DBI

- libnet

Pre-built x86 and x86_64 packages for specific kernel versions are available with a support subscription from LINBIT. Please note that if the kernel is upgraded, DRBD must be as well.

B.14.9.2: How many machines are required to set up DRBD?

Two machines are required to achieve the minimum degree of high availability. Although at any one given point in time one will be primary and one will be secondary, it is better to consider the machines as part of a mirrored pair without a “natural” primary machine.

B.14.9.3: Does DRBD only run on Linux?

DRBD is a Linux Kernel Module, and can work with many popular Linux distributions. DRBD is currently not available for non-Linux operating systems.

B.14.10. DRBD and Support and Consulting

In the following section, we provide answers to questions that are most frequently asked about DRBD and resources.

Questions

- B.14.10.1: Does MySQL offer professional consulting to help with designing a DRBD system?
- B.14.10.2: Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?
- B.14.10.3: Are pre-built binaries or RPMs available?
- B.14.10.4: Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?
- B.14.10.5: Is there a dedicated discussion forum for MySQL High-Availability?
- B.14.10.6: Where can I get more information about MySQL for DRBD?

Questions and Answers

B.14.10.1: Does MySQL offer professional consulting to help with designing a DRBD system?

Yes. MySQL offers consulting for the design, installation, configuration, and monitoring of high availability DRBD. For more information concerning a High Availability Jumpstart, please see: http://www.mysql.com/consulting/packaged/scaleout.html.

B.14.10.2: Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?

Yes. Support for DRBD is available with an add-on subscription to MySQL Enterprise called “DRBD for MySQL”. For more information about support options for DRBD see: http://mysql.com/products/enterprise/features.html.

For the list of supported Linux distributions, please see: http://www.mysql.com/support/supportedplatforms/enterprise.html.

> **Note**
>
> DRBD is only available on Linux. DRBD is not available on Windows, MacOS, Solaris, HPUX, AIX, FreeBSD, or other non-Linux platforms.

B.14.10.3: Are pre-built binaries or RPMs available?

Yes. “DRBD for MySQL” is an add-on subscription to MySQL Enterprise, which provides pre-built binaries for DRBD. For more information, see: http://mysql.com/products/enterprise/features.html.

B.14.10.4: Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?

For MySQL-specific DRBD documentation, see Section 14.2, “Using MySQL with DRBD”.

For general DRBD documentation, see DRBD User's Guide.

B.14.10.5: Is there a dedicated discussion forum for MySQL High-Availability?

Yes, http://forums.mysql.com/list.php?144.

B.14.10.6: Where can I get more information about MySQL for DRBD?

For more information about MySQL for DRBD, including a technical white paper please see: http://www.mysql.com/products/enterprise/drbd.html.

Appendix C. Errors, Error Codes, and Common Problems

Table of Contents

C.1. Sources of Error Information 2913
C.2. Types of Error Values 2913
C.3. Server Error Codes and Messages 2914
C.4. Client Error Codes and Messages 2955
C.5. Problems and Common Errors 2959
C.5.1. How to Determine What Is Causing a Problem 2959
C.5.2. Common Errors When Using MySQL Programs 2960
C.5.3. Installation-Related Issues 2970
C.5.4. Administration-Related Issues 2971
C.5.5. Query-Related Issues 2976
C.5.6. Optimizer-Related Issues 2982
C.5.7. Table Definition-Related Issues 2982
C.5.8. Known Issues in MySQL 2983

This appendix lists common problems and errors that may occur and potential resolutions, in addition to listing the errors that may appear when you call MySQL from any host language. The first section covers problems and resolutions. Detailed information on errors is provided: One list displays server error messages. Another list displays client program messages.

C.1. Sources of Error Information

There are several sources of error information in MySQL:

- Each SQL statement executed results in an error code, an SQLSTATE value, and an error message, as described in Section C.2, “Types of Error Values”. These errors are returned from the server side; see Section C.3, “Server Error Codes and Messages”.
- Errors can occur on the client side, usually involving problems communicating with the server; see Section C.4, “Client Error Codes and Messages”.
- SQL statement warning and error information is available through the `SHOW WARNINGS` and `SHOW ERRORS` statements. The `warning_count` system variable indicates the number of errors, warnings, and notes. The `error_count` system variable indicates the number of errors. Its value excludes warnings and notes.
- `SHOW SLAVE STATUS` statement output includes information about replication errors occurring on the slave side.
- `SHOW ENGINE INNODB STATUS` statement output includes information about the most recent foreign key error if a `CREATE TABLE` statement for an `InnoDB` table fails.
- The `perror` program provides information from the command line about error numbers. See Section 4.8.1, “`perror` — Explain Error Codes”.

Descriptions of server and client errors are provided later in this Appendix. For information about errors related to `InnoDB`, see Section 13.3.13, “`InnoDB` Error Handling”.

C.2. Types of Error Values

When an error occurs in MySQL, the server returns two types of error values:

- A MySQL-specific error code. This value is numeric. It is not portable to other database systems.
- An SQLSTATE value. The value is a five-character string (for example, `'42S02'`). The values are taken from ANSI SQL and ODBC and are more standardized.

A message string that provides a textual description of the error is also available.

When an error occurs, the MySQL error code, SQLSTATE value, and message string are available using C API functions:

- MySQL error code: Call `mysql_errno()`
- SQLSTATE value: Call `mysql_sqlstate()`
- Error message: Call `mysql_error()`

For prepared statements, the corresponding error functions are `mysql_stmt_errno()`, `mysql_stmt_sqlstate()`, and `mysql_stmt_error()`. All error functions are described in Section 21.9, “MySQL C API”.

The number of errors, warnings, and notes for the previous statement can be obtained by calling `mysql_warning_count()`. See Section 21.9.3.72, “`mysql_warning_count()`”.

The first two characters of an SQLSTATE value indicate the error class:

- Class = `'00'` indicates success.
- Class = `'01'` indicates a warning.
- Class = `'02'` indicates “not found.” This is relevant within the context of cursors and is used to control what happens when a cursor reaches the end of a data set. This condition also occurs for `SELECT ... INTO var_list` statements that retrieve no rows.
- Class > `'02'` indicates an exception.

C.3. Server Error Codes and Messages

MySQL programs have access to several types of error information when the server returns an error. For example, the `mysql` client program displays errors using the following format:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

The message displayed contains three types of information:

- A numeric error code (`1146`). This number is MySQL-specific and is not portable to other database systems.
- A five-character SQLSTATE value (`'42S02'`). The values are taken from ANSI SQL and ODBC and are more standardized. Not all MySQL error numbers have corresponding SQLSTATE values. In these cases, `'HY000'` (general error) is used.
- A message string that provides a textual description of the error.

For error checking, use error codes, not error messages. Error messages do not change often, but it is possible. Also if the database administrator changes the language setting, that affects the language of error messages.

Error codes are stable across GA releases of a given MySQL series. Before a series reaches GA status, new codes may still be under development and subject to change.

Server error information comes from the following source files. For details about the way that error information is defined, see the MySQL Internals manual, available at http://forge.mysql.com/wiki/MySQL_Internals.

- Error message information is listed in the `share/errmsg.txt` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the Message values when they are displayed.
- The Error values listed in `share/errmsg.txt` are used to generate the definitions in the `include/mysqld_error.h` and `include/mysqld_ername.h` MySQL source files.
- The SQLSTATE values listed in `share/errmsg.txt` are used to generate the definitions in the `include/sql_state.h` MySQL source file.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: `1000` SQLSTATE: `HY000` (`ER_HASHCHK`)

Message: hashchk

- Error: 1001 SQLSTATE: HY000 (ER_NISAMCHK)

  Message: isamchk

- Error: 1002 SQLSTATE: HY000 (ER_NO)

  Message: NO

- Error: 1003 SQLSTATE: HY000 (ER_YES)

  Message: YES

- Error: 1004 SQLSTATE: HY000 (ER_CANT_CREATE_FILE)

  Message: Can't create file '%s' (errno: %d)

- Error: 1005 SQLSTATE: HY000 (ER_CANT_CREATE_TABLE)

  Message: Can't create table '%s' (errno: %d)

- Error: 1006 SQLSTATE: HY000 (ER_CANT_CREATE_DB)

  Message: Can't create database '%s' (errno: %d)

- Error: 1007 SQLSTATE: HY000 (ER_DB_CREATE_EXISTS)

  Message: Can't create database '%s'; database exists

- Error: 1008 SQLSTATE: HY000 (ER_DB_DROP_EXISTS)

  Message: Can't drop database '%s'; database doesn't exist

- Error: 1009 SQLSTATE: HY000 (ER_DB_DROP_DELETE)

  Message: Error dropping database (can't delete '%s', errno: %d)

- Error: 1010 SQLSTATE: HY000 (ER_DB_DROP_RMDIR)

  Message: Error dropping database (can't rmdir '%s', errno: %d)

- Error: 1011 SQLSTATE: HY000 (ER_CANT_DELETE_FILE)

  Message: Error on delete of '%s' (errno: %d)

- Error: 1012 SQLSTATE: HY000 (ER_CANT_FIND_SYSTEM_REC)

  Message: Can't read record in system table

- Error: 1013 SQLSTATE: HY000 (ER_CANT_GET_STAT)

  Message: Can't get status of '%s' (errno: %d)

- Error: 1014 SQLSTATE: HY000 (ER_CANT_GET_WD)

  Message: Can't get working directory (errno: %d)

- Error: 1015 SQLSTATE: HY000 (ER_CANT_LOCK)

  Message: Can't lock file (errno: %d)

- Error: 1016 SQLSTATE: HY000 (ER_CANT_OPEN_FILE)

  Message: Can't open file: '%s' (errno: %d)

- Error: 1017 SQLSTATE: HY000 (ER_FILE_NOT_FOUND)

  Message: Can't find file: '%s' (errno: %d)

- Error: 1018 SQLSTATE: HY000 (ER_CANT_READ_DIR)

Message: Can't read dir of '%s' (errno: %d)

- Error: 1019 SQLSTATE: HY000 (ER_CANT_SET_WD)

  Message: Can't change dir to '%s' (errno: %d)

- Error: 1020 SQLSTATE: HY000 (ER_CHECKREAD)

  Message: Record has changed since last read in table '%s'

- Error: 1021 SQLSTATE: HY000 (ER_DISK_FULL)

  Message: Disk full (%s); waiting for someone to free some space...

- Error: 1022 SQLSTATE: 23000 (ER_DUP_KEY)

  Message: Can't write; duplicate key in table '%s'

- Error: 1023 SQLSTATE: HY000 (ER_ERROR_ON_CLOSE)

  Message: Error on close of '%s' (errno: %d)

- Error: 1024 SQLSTATE: HY000 (ER_ERROR_ON_READ)

  Message: Error reading file '%s' (errno: %d)

- Error: 1025 SQLSTATE: HY000 (ER_ERROR_ON_RENAME)

  Message: Error on rename of '%s' to '%s' (errno: %d)

- Error: 1026 SQLSTATE: HY000 (ER_ERROR_ON_WRITE)

  Message: Error writing file '%s' (errno: %d)

- Error: 1027 SQLSTATE: HY000 (ER_FILE_USED)

  Message: '%s' is locked against change

- Error: 1028 SQLSTATE: HY000 (ER_FILSORT_ABORT)

  Message: Sort aborted

- Error: 1029 SQLSTATE: HY000 (ER_FORM_NOT_FOUND)

  Message: View '%s' doesn't exist for '%s'

- Error: 1030 SQLSTATE: HY000 (ER_GET_ERRNO)

  Message: Got error %d from storage engine

- Error: 1031 SQLSTATE: HY000 (ER_ILLEGAL_HA)

  Message: Table storage engine for '%s' doesn't have this option

- Error: 1032 SQLSTATE: HY000 (ER_KEY_NOT_FOUND)

  Message: Can't find record in '%s'

- Error: 1033 SQLSTATE: HY000 (ER_NOT_FORM_FILE)

  Message: Incorrect information in file: '%s'

- Error: 1034 SQLSTATE: HY000 (ER_NOT_KEYFILE)

  Message: Incorrect key file for table '%s'; try to repair it

- Error: 1035 SQLSTATE: HY000 (ER_OLD_KEYFILE)

  Message: Old key file for table '%s'; repair it!

- Error: 1036 SQLSTATE: HY000 (ER_OPEN_AS_READONLY)

Message: Table '%s' is read only

- Error: 1037 SQLSTATE: HY001 (ER_OUTOFMEMORY)

  Message: Out of memory; restart server and try again (needed %d bytes)

- Error: 1038 SQLSTATE: HY001 (ER_OUT_OF_SORTMEMORY)

  Message: Out of sort memory, consider increasing server sort buffer size

- Error: 1039 SQLSTATE: HY000 (ER_UNEXPECTED_EOF)

  Message: Unexpected EOF found when reading file '%s' (errno: %d)

- Error: 1040 SQLSTATE: 08004 (ER_CON_COUNT_ERROR)

  Message: Too many connections

- Error: 1041 SQLSTATE: HY000 (ER_OUT_OF_RESOURCES)

  Message: Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use 'ulimit' to allow mysqld to use more memory or you can add more swap space

- Error: 1042 SQLSTATE: 08S01 (ER_BAD_HOST_ERROR)

  Message: Can't get hostname for your address

- Error: 1043 SQLSTATE: 08S01 (ER_HANDSHAKE_ERROR)

  Message: Bad handshake

- Error: 1044 SQLSTATE: 42000 (ER_DBACCESS_DENIED_ERROR)

  Message: Access denied for user '%s'@'%s' to database '%s'

- Error: 1045 SQLSTATE: 28000 (ER_ACCESS_DENIED_ERROR)

  Message: Access denied for user '%s'@'%s' (using password: %s)

- Error: 1046 SQLSTATE: 3D000 (ER_NO_DB_ERROR)

  Message: No database selected

- Error: 1047 SQLSTATE: 08S01 (ER_UNKNOWN_COM_ERROR)

  Message: Unknown command

- Error: 1048 SQLSTATE: 23000 (ER_BAD_NULL_ERROR)

  Message: Column '%s' cannot be null

- Error: 1049 SQLSTATE: 42000 (ER_BAD_DB_ERROR)

  Message: Unknown database '%s'

- Error: 1050 SQLSTATE: 42S01 (ER_TABLE_EXISTS_ERROR)

  Message: Table '%s' already exists

- Error: 1051 SQLSTATE: 42S02 (ER_BAD_TABLE_ERROR)

  Message: Unknown table '%s'

- Error: 1052 SQLSTATE: 23000 (ER_NON_UNIQ_ERROR)

  Message: Column '%s' in %s is ambiguous

- Error: 1053 SQLSTATE: 08S01 (ER_SERVER_SHUTDOWN)

  Message: Server shutdown in progress

- Error: 1054 SQLSTATE: 42S22 (ER_BAD_FIELD_ERROR)

  Message: Unknown column '%s' in '%s'
- Error: 1055 SQLSTATE: 42000 (ER_WRONG_FIELD_WITH_GROUP)

  Message: '%s' isn't in GROUP BY
- Error: 1056 SQLSTATE: 42000 (ER_WRONG_GROUP_FIELD)

  Message: Can't group on '%s'
- Error: 1057 SQLSTATE: 42000 (ER_WRONG_SUM_SELECT)

  Message: Statement has sum functions and columns in same statement
- Error: 1058 SQLSTATE: 21S01 (ER_WRONG_VALUE_COUNT)

  Message: Column count doesn't match value count
- Error: 1059 SQLSTATE: 42000 (ER_TOO_LONG_IDENT)

  Message: Identifier name '%s' is too long
- Error: 1060 SQLSTATE: 42S21 (ER_DUP_FIELDNAME)

  Message: Duplicate column name '%s'
- Error: 1061 SQLSTATE: 42000 (ER_DUP_KEYNAME)

  Message: Duplicate key name '%s'
- Error: 1062 SQLSTATE: 23000 (ER_DUP_ENTRY)

  Message: Duplicate entry '%s' for key %d
- Error: 1063 SQLSTATE: 42000 (ER_WRONG_FIELD_SPEC)

  Message: Incorrect column specifier for column '%s'
- Error: 1064 SQLSTATE: 42000 (ER_PARSE_ERROR)

  Message: %s near '%s' at line %d
- Error: 1065 SQLSTATE: 42000 (ER_EMPTY_QUERY)

  Message: Query was empty
- Error: 1066 SQLSTATE: 42000 (ER_NONUNIQ_TABLE)

  Message: Not unique table/alias: '%s'
- Error: 1067 SQLSTATE: 42000 (ER_INVALID_DEFAULT)

  Message: Invalid default value for '%s'
- Error: 1068 SQLSTATE: 42000 (ER_MULTIPLE_PRI_KEY)

  Message: Multiple primary key defined
- Error: 1069 SQLSTATE: 42000 (ER_TOO_MANY_KEYS)

  Message: Too many keys specified; max %d keys allowed
- Error: 1070 SQLSTATE: 42000 (ER_TOO_MANY_KEY_PARTS)

  Message: Too many key parts specified; max %d parts allowed
- Error: 1071 SQLSTATE: 42000 (ER_TOO_LONG_KEY)

  Message: Specified key was too long; max key length is %d bytes

- Error: 1072 SQLSTATE: 42000 (ER_KEY_COLUMN_DOES_NOT_EXITS)

  Message: Key column '%s' doesn't exist in table

- Error: 1073 SQLSTATE: 42000 (ER_BLOB_USED_AS_KEY)

  Message: BLOB column '%s' can't be used in key specification with the used table type

- Error: 1074 SQLSTATE: 42000 (ER_TOO_BIG_FIELDLENGTH)

  Message: Column length too big for column '%s' (max = %lu); use BLOB or TEXT instead

- Error: 1075 SQLSTATE: 42000 (ER_WRONG_AUTO_KEY)

  Message: Incorrect table definition; there can be only one auto column and it must be defined as a key

- Error: 1076 SQLSTATE: HY000 (ER_READY)

  Message: %s: ready for connections. Version: '%s' socket: '%s' port: %d

- Error: 1077 SQLSTATE: HY000 (ER_NORMAL_SHUTDOWN)

  Message: %s: Normal shutdown

- Error: 1078 SQLSTATE: HY000 (ER_GOT_SIGNAL)

  Message: %s: Got signal %d. Aborting!

- Error: 1079 SQLSTATE: HY000 (ER_SHUTDOWN_COMPLETE)

  Message: %s: Shutdown complete

- Error: 1080 SQLSTATE: 08S01 (ER_FORCING_CLOSE)

  Message: %s: Forcing close of thread %ld user: '%s'

- Error: 1081 SQLSTATE: 08S01 (ER_IPSOCK_ERROR)

  Message: Can't create IP socket

- Error: 1082 SQLSTATE: 42S12 (ER_NO_SUCH_INDEX)

  Message: Table '%s' has no index like the one used in CREATE INDEX; recreate the table

- Error: 1083 SQLSTATE: 42000 (ER_WRONG_FIELD_TERMINATORS)

  Message: Field separator argument is not what is expected; check the manual

- Error: 1084 SQLSTATE: 42000 (ER_BLOBS_AND_NO_TERMINATED)

  Message: You can't use fixed rowlength with BLOBs; please use 'fields terminated by'

- Error: 1085 SQLSTATE: HY000 (ER_TEXTFILE_NOT_READABLE)

  Message: The file '%s' must be in the database directory or be readable by all

- Error: 1086 SQLSTATE: HY000 (ER_FILE_EXISTS_ERROR)

  Message: File '%s' already exists

- Error: 1087 SQLSTATE: HY000 (ER_LOAD_INFO)

  Message: Records: %ld Deleted: %ld Skipped: %ld Warnings: %ld

- Error: 1088 SQLSTATE: HY000 (ER_ALTER_INFO)

  Message: Records: %ld Duplicates: %ld

- Error: 1089 SQLSTATE: HY000 (ER_WRONG_SUB_KEY)

  Message: Incorrect prefix key; the used key part isn't a string, the used length is longer than the key part, or the storage engine doesn't support unique prefix keys

- Error: 1090 SQLSTATE: 42000 (ER_CANT_REMOVE_ALL_FIELDS)

  Message: You can't delete all columns with ALTER TABLE; use DROP TABLE instead

- Error: 1091 SQLSTATE: 42000 (ER_CANT_DROP_FIELD_OR_KEY)

  Message: Can't DROP '%s'; check that column/key exists

- Error: 1092 SQLSTATE: HY000 (ER_INSERT_INFO)

  Message: Records: %ld Duplicates: %ld Warnings: %ld

- Error: 1093 SQLSTATE: HY000 (ER_UPDATE_TABLE_USED)

  Message: You can't specify target table '%s' for update in FROM clause

- Error: 1094 SQLSTATE: HY000 (ER_NO_SUCH_THREAD)

  Message: Unknown thread id: %lu

- Error: 1095 SQLSTATE: HY000 (ER_KILL_DENIED_ERROR)

  Message: You are not owner of thread %lu

- Error: 1096 SQLSTATE: HY000 (ER_NO_TABLES_USED)

  Message: No tables used

- Error: 1097 SQLSTATE: HY000 (ER_TOO_BIG_SET)

  Message: Too many strings for column %s and SET

- Error: 1098 SQLSTATE: HY000 (ER_NO_UNIQUE_LOGFILE)

  Message: Can't generate a unique log-filename %s.(1-999)

- Error: 1099 SQLSTATE: HY000 (ER_TABLE_NOT_LOCKED_FOR_WRITE)

  Message: Table '%s' was locked with a READ lock and can't be updated

- Error: 1100 SQLSTATE: HY000 (ER_TABLE_NOT_LOCKED)

  Message: Table '%s' was not locked with LOCK TABLES

- Error: 1101 SQLSTATE: 42000 (ER_BLOB_CANT_HAVE_DEFAULT)

  Message: BLOB/TEXT column '%s' can't have a default value

- Error: 1102 SQLSTATE: 42000 (ER_WRONG_DB_NAME)

  Message: Incorrect database name '%s'

- Error: 1103 SQLSTATE: 42000 (ER_WRONG_TABLE_NAME)

  Message: Incorrect table name '%s'

- Error: 1104 SQLSTATE: 42000 (ER_TOO_BIG_SELECT)

  Message: The SELECT would examine more than MAX_JOIN_SIZE rows; check your WHERE and use SET SQL_BIG_SELECTS=1 or SET MAX_JOIN_SIZE=# if the SELECT is okay

- Error: 1105 SQLSTATE: HY000 (ER_UNKNOWN_ERROR)

  Message: Unknown error

- Error: 1106 SQLSTATE: 42000 (ER_UNKNOWN_PROCEDURE)

  Message: Unknown procedure '%s'

- Error: 1107 SQLSTATE: 42000 (ER_WRONG_PARAMCOUNT_TO_PROCEDURE)

  Message: Incorrect parameter count to procedure '%s'

- Error: 1108 SQLSTATE: HY000 (ER_WRONG_PARAMETERS_TO_PROCEDURE)

  Message: Incorrect parameters to procedure '%s'

- Error: 1109 SQLSTATE: 42S02 (ER_UNKNOWN_TABLE)

  Message: Unknown table '%s' in %s

- Error: 1110 SQLSTATE: 42000 (ER_FIELD_SPECIFIED_TWICE)

  Message: Column '%s' specified twice

- Error: 1111 SQLSTATE: HY000 (ER_INVALID_GROUP_FUNC_USE)

  Message: Invalid use of group function

- Error: 1112 SQLSTATE: 42000 (ER_UNSUPPORTED_EXTENSION)

  Message: Table '%s' uses an extension that doesn't exist in this MySQL version

- Error: 1113 SQLSTATE: 42000 (ER_TABLE_MUST_HAVE_COLUMNS)

  Message: A table must have at least 1 column

- Error: 1114 SQLSTATE: HY000 (ER_RECORD_FILE_FULL)

  Message: The table '%s' is full

- Error: 1115 SQLSTATE: 42000 (ER_UNKNOWN_CHARACTER_SET)

  Message: Unknown character set: '%s'

- Error: 1116 SQLSTATE: HY000 (ER_TOO_MANY_TABLES)

  Message: Too many tables; MySQL can only use %d tables in a join

- Error: 1117 SQLSTATE: HY000 (ER_TOO_MANY_FIELDS)

  Message: Too many columns

- Error: 1118 SQLSTATE: 42000 (ER_TOO_BIG_ROWSIZE)

  Message: Row size too large. The maximum row size for the used table type, not counting BLOBs, is %ld. You have to change some columns to TEXT or BLOBs

- Error: 1119 SQLSTATE: HY000 (ER_STACK_OVERRUN)

  Message: Thread stack overrun: Used: %ld of a %ld stack. Use 'mysqld --thread_stack=#' to specify a bigger stack if needed

- Error: 1120 SQLSTATE: 42000 (ER_WRONG_OUTER_JOIN)

  Message: Cross dependency found in OUTER JOIN; examine your ON conditions

- Error: 1121 SQLSTATE: 42000 (ER_NULL_COLUMN_IN_INDEX)

  Message: Table handler doesn't support NULL in given index. Please change column '%s' to be NOT NULL or use another handler

- Error: 1122 SQLSTATE: HY000 (ER_CANT_FIND_UDF)

  Message: Can't load function '%s'

- Error: 1123 SQLSTATE: HY000 (ER_CANT_INITIALIZE_UDF)

  Message: Can't initialize function '%s'; %s

- Error: 1124 SQLSTATE: HY000 (ER_UDF_NO_PATHS)

  Message: No paths allowed for shared library

- Error: 1125 SQLSTATE: HY000 (ER_UDF_EXISTS)

Message: Function '%s' already exists

- Error: 1126 SQLSTATE: HY000 (ER_CANT_OPEN_LIBRARY)

  Message: Can't open shared library '%s' (errno: %d %s)

- Error: 1127 SQLSTATE: HY000 (ER_CANT_FIND_DL_ENTRY)

  Message: Can't find symbol '%s' in library

- Error: 1128 SQLSTATE: HY000 (ER_FUNCTION_NOT_DEFINED)

  Message: Function '%s' is not defined

- Error: 1129 SQLSTATE: HY000 (ER_HOST_IS_BLOCKED)

  Message: Host '%s' is blocked because of many connection errors; unblock with 'mysqladmin flush-hosts'

- Error: 1130 SQLSTATE: HY000 (ER_HOST_NOT_PRIVILEGED)

  Message: Host '%s' is not allowed to connect to this MySQL server

- Error: 1131 SQLSTATE: 42000 (ER_PASSWORD_ANONYMOUS_USER)

  Message: You are using MySQL as an anonymous user and anonymous users are not allowed to change passwords

- Error: 1132 SQLSTATE: 42000 (ER_PASSWORD_NOT_ALLOWED)

  Message: You must have privileges to update tables in the mysql database to be able to change passwords for others

- Error: 1133 SQLSTATE: 42000 (ER_PASSWORD_NO_MATCH)

  Message: Can't find any matching row in the user table

- Error: 1134 SQLSTATE: HY000 (ER_UPDATE_INFO)

  Message: Rows matched: %ld Changed: %ld Warnings: %ld

- Error: 1135 SQLSTATE: HY000 (ER_CANT_CREATE_THREAD)

  Message: Can't create a new thread (errno %d); if you are not out of available memory, you can consult the manual for a possible OS-dependent bug

- Error: 1136 SQLSTATE: 21S01 (ER_WRONG_VALUE_COUNT_ON_ROW)

  Message: Column count doesn't match value count at row %ld

- Error: 1137 SQLSTATE: HY000 (ER_CANT_REOPEN_TABLE)

  Message: Can't reopen table: '%s'

- Error: 1138 SQLSTATE: 22004 (ER_INVALID_USE_OF_NULL)

  Message: Invalid use of NULL value

- Error: 1139 SQLSTATE: 42000 (ER_REGEXP_ERROR)

  Message: Got error '%s' from regexp

- Error: 1140 SQLSTATE: 42000 (ER_MIX_OF_GROUP_FUNC_AND_FIELDS)

  Message: Mixing of GROUP columns (MIN(),MAX(),COUNT(),...) with no GROUP columns is illegal if there is no GROUP BY clause

- Error: 1141 SQLSTATE: 42000 (ER_NONEXISTING_GRANT)

  Message: There is no such grant defined for user '%s' on host '%s'

- Error: 1142 SQLSTATE: 42000 (ER_TABLEACCESS_DENIED_ERROR)

  Message: %s command denied to user '%s'@'%s' for table '%s'

- Error: 1143 SQLSTATE: 42000 (ER_COLUMNACCESS_DENIED_ERROR)

  Message: %s command denied to user '%s'@'%s' for column '%s' in table '%s'

- Error: 1144 SQLSTATE: 42000 (ER_ILLEGAL_GRANT_FOR_TABLE)

  Message: Illegal GRANT/REVOKE command; please consult the manual to see which privileges can be used

- Error: 1145 SQLSTATE: 42000 (ER_GRANT_WRONG_HOST_OR_USER)

  Message: The host or user argument to GRANT is too long

- Error: 1146 SQLSTATE: 42S02 (ER_NO_SUCH_TABLE)

  Message: Table '%s.%s' doesn't exist

- Error: 1147 SQLSTATE: 42000 (ER_NONEXISTING_TABLE_GRANT)

  Message: There is no such grant defined for user '%s' on host '%s' on table '%s'

- Error: 1148 SQLSTATE: 42000 (ER_NOT_ALLOWED_COMMAND)

  Message: The used command is not allowed with this MySQL version

- Error: 1149 SQLSTATE: 42000 (ER_SYNTAX_ERROR)

  Message: You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use

- Error: 1150 SQLSTATE: HY000 (ER_DELAYED_CANT_CHANGE_LOCK)

  Message: Delayed insert thread couldn't get requested lock for table %s

- Error: 1151 SQLSTATE: HY000 (ER_TOO_MANY_DELAYED_THREADS)

  Message: Too many delayed threads in use

- Error: 1152 SQLSTATE: 08S01 (ER_ABORTING_CONNECTION)

  Message: Aborted connection %ld to db: '%s' user: '%s' (%s)

- Error: 1153 SQLSTATE: 08S01 (ER_NET_PACKET_TOO_LARGE)

  Message: Got a packet bigger than 'max_allowed_packet' bytes

- Error: 1154 SQLSTATE: 08S01 (ER_NET_READ_ERROR_FROM_PIPE)

  Message: Got a read error from the connection pipe

- Error: 1155 SQLSTATE: 08S01 (ER_NET_FCNTL_ERROR)

  Message: Got an error from fcntl()

- Error: 1156 SQLSTATE: 08S01 (ER_NET_PACKETS_OUT_OF_ORDER)

  Message: Got packets out of order

- Error: 1157 SQLSTATE: 08S01 (ER_NET_UNCOMPRESS_ERROR)

  Message: Couldn't uncompress communication packet

- Error: 1158 SQLSTATE: 08S01 (ER_NET_READ_ERROR)

  Message: Got an error reading communication packets

- Error: 1159 SQLSTATE: 08S01 (ER_NET_READ_INTERRUPTED)

  Message: Got timeout reading communication packets

- Error: 1160 SQLSTATE: 08S01 (ER_NET_ERROR_ON_WRITE)

  Message: Got an error writing communication packets

- Error: 1161 SQLSTATE: 08S01 (ER_NET_WRITE_INTERRUPTED)

  Message: Got timeout writing communication packets
- Error: 1162 SQLSTATE: 42000 (ER_TOO_LONG_STRING)

  Message: Result string is longer than 'max_allowed_packet' bytes
- Error: 1163 SQLSTATE: 42000 (ER_TABLE_CANT_HANDLE_BLOB)

  Message: The used table type doesn't support BLOB/TEXT columns
- Error: 1164 SQLSTATE: 42000 (ER_TABLE_CANT_HANDLE_AUTO_INCREMENT)

  Message: The used table type doesn't support AUTO_INCREMENT columns
- Error: 1165 SQLSTATE: HY000 (ER_DELAYED_INSERT_TABLE_LOCKED)

  Message: INSERT DELAYED can't be used with table '%s' because it is locked with LOCK TABLES
- Error: 1166 SQLSTATE: 42000 (ER_WRONG_COLUMN_NAME)

  Message: Incorrect column name '%s'
- Error: 1167 SQLSTATE: 42000 (ER_WRONG_KEY_COLUMN)

  Message: The used storage engine can't index column '%s'
- Error: 1168 SQLSTATE: HY000 (ER_WRONG_MRG_TABLE)

  Message: Unable to open underlying table which is differently defined or of non-MyISAM type or doesn't exist
- Error: 1169 SQLSTATE: 23000 (ER_DUP_UNIQUE)

  Message: Can't write, because of unique constraint, to table '%s'
- Error: 1170 SQLSTATE: 42000 (ER_BLOB_KEY_WITHOUT_LENGTH)

  Message: BLOB/TEXT column '%s' used in key specification without a key length
- Error: 1171 SQLSTATE: 42000 (ER_PRIMARY_CANT_HAVE_NULL)

  Message: All parts of a PRIMARY KEY must be NOT NULL; if you need NULL in a key, use UNIQUE instead
- Error: 1172 SQLSTATE: 42000 (ER_TOO_MANY_ROWS)

  Message: Result consisted of more than one row
- Error: 1173 SQLSTATE: 42000 (ER_REQUIRES_PRIMARY_KEY)

  Message: This table type requires a primary key
- Error: 1174 SQLSTATE: HY000 (ER_NO_RAID_COMPILED)

  Message: This version of MySQL is not compiled with RAID support
- Error: 1175 SQLSTATE: HY000 (ER_UPDATE_WITHOUT_KEY_IN_SAFE_MODE)

  Message: You are using safe update mode and you tried to update a table without a WHERE that uses a KEY column
- Error: 1176 SQLSTATE: 42000 (ER_KEY_DOES_NOT_EXITS)

  Message: Key '%s' doesn't exist in table '%s'
- Error: 1177 SQLSTATE: 42000 (ER_CHECK_NO_SUCH_TABLE)

  Message: Can't open table
- Error: 1178 SQLSTATE: 42000 (ER_CHECK_NOT_IMPLEMENTED)

  Message: The storage engine for the table doesn't support %s

- Error: 1179 SQLSTATE: 25000 (ER_CANT_DO_THIS_DURING_AN_TRANSACTION)

  Message: You are not allowed to execute this command in a transaction
- Error: 1180 SQLSTATE: HY000 (ER_ERROR_DURING_COMMIT)

  Message: Got error %d during COMMIT
- Error: 1181 SQLSTATE: HY000 (ER_ERROR_DURING_ROLLBACK)

  Message: Got error %d during ROLLBACK
- Error: 1182 SQLSTATE: HY000 (ER_ERROR_DURING_FLUSH_LOGS)

  Message: Got error %d during FLUSH_LOGS
- Error: 1183 SQLSTATE: HY000 (ER_ERROR_DURING_CHECKPOINT)

  Message: Got error %d during CHECKPOINT
- Error: 1184 SQLSTATE: 08S01 (ER_NEW_ABORTING_CONNECTION)

  Message: Aborted connection %ld to db: '%s' user: '%s' host: '%s' (%s)
- Error: 1185 SQLSTATE: HY000 (ER_DUMP_NOT_IMPLEMENTED)

  Message: The storage engine for the table does not support binary table dump
- Error: 1186 SQLSTATE: HY000 (ER_FLUSH_MASTER_BINLOG_CLOSED)

  Message: Binlog closed, cannot RESET MASTER
- Error: 1187 SQLSTATE: HY000 (ER_INDEX_REBUILD)

  Message: Failed rebuilding the index of dumped table '%s'
- Error: 1188 SQLSTATE: HY000 (ER_MASTER)

  Message: Error from master: '%s'
- Error: 1189 SQLSTATE: 08S01 (ER_MASTER_NET_READ)

  Message: Net error reading from master
- Error: 1190 SQLSTATE: 08S01 (ER_MASTER_NET_WRITE)

  Message: Net error writing to master
- Error: 1191 SQLSTATE: HY000 (ER_FT_MATCHING_KEY_NOT_FOUND)

  Message: Can't find FULLTEXT index matching the column list
- Error: 1192 SQLSTATE: HY000 (ER_LOCK_OR_ACTIVE_TRANSACTION)

  Message: Can't execute the given command because you have active locked tables or an active transaction
- Error: 1193 SQLSTATE: HY000 (ER_UNKNOWN_SYSTEM_VARIABLE)

  Message: Unknown system variable '%s'
- Error: 1194 SQLSTATE: HY000 (ER_CRASHED_ON_USAGE)

  Message: Table '%s' is marked as crashed and should be repaired
- Error: 1195 SQLSTATE: HY000 (ER_CRASHED_ON_REPAIR)

  Message: Table '%s' is marked as crashed and last (automatic?) repair failed
- Error: 1196 SQLSTATE: HY000 (ER_WARNING_NOT_COMPLETE_ROLLBACK)

  Message: Some non-transactional changed tables couldn't be rolled back

- Error: 1197 SQLSTATE: HY000 (ER_TRANS_CACHE_FULL)

  Message: Multi-statement transaction required more than 'max_binlog_cache_size' bytes of storage; increase this mysqld variable and try again

- Error: 1198 SQLSTATE: HY000 (ER_SLAVE_MUST_STOP)

  Message: This operation cannot be performed with a running slave; run STOP SLAVE first

- Error: 1199 SQLSTATE: HY000 (ER_SLAVE_NOT_RUNNING)

  Message: This operation requires a running slave; configure slave and do START SLAVE

- Error: 1200 SQLSTATE: HY000 (ER_BAD_SLAVE)

  Message: The server is not configured as slave; fix in config file or with CHANGE MASTER TO

- Error: 1201 SQLSTATE: HY000 (ER_MASTER_INFO)

  Message: Could not initialize master info structure; more error messages can be found in the MySQL error log

- Error: 1202 SQLSTATE: HY000 (ER_SLAVE_THREAD)

  Message: Could not create slave thread; check system resources

- Error: 1203 SQLSTATE: 42000 (ER_TOO_MANY_USER_CONNECTIONS)

  Message: User %s already has more than 'max_user_connections' active connections

- Error: 1204 SQLSTATE: HY000 (ER_SET_CONSTANTS_ONLY)

  Message: You may only use constant expressions with SET

- Error: 1205 SQLSTATE: HY000 (ER_LOCK_WAIT_TIMEOUT)

  Message: Lock wait timeout exceeded; try restarting transaction

- Error: 1206 SQLSTATE: HY000 (ER_LOCK_TABLE_FULL)

  Message: The total number of locks exceeds the lock table size

- Error: 1207 SQLSTATE: 25000 (ER_READ_ONLY_TRANSACTION)

  Message: Update locks cannot be acquired during a READ UNCOMMITTED transaction

- Error: 1208 SQLSTATE: HY000 (ER_DROP_DB_WITH_READ_LOCK)

  Message: DROP DATABASE not allowed while thread is holding global read lock

- Error: 1209 SQLSTATE: HY000 (ER_CREATE_DB_WITH_READ_LOCK)

  Message: CREATE DATABASE not allowed while thread is holding global read lock

- Error: 1210 SQLSTATE: HY000 (ER_WRONG_ARGUMENTS)

  Message: Incorrect arguments to %s

- Error: 1211 SQLSTATE: 42000 (ER_NO_PERMISSION_TO_CREATE_USER)

  Message: '%s'@'%s' is not allowed to create new users

- Error: 1212 SQLSTATE: HY000 (ER_UNION_TABLES_IN_DIFFERENT_DIR)

  Message: Incorrect table definition; all MERGE tables must be in the same database

- Error: 1213 SQLSTATE: 40001 (ER_LOCK_DEADLOCK)

  Message: Deadlock found when trying to get lock; try restarting transaction

- Error: 1214 SQLSTATE: HY000 (ER_TABLE_CANT_HANDLE_FT)

  Message: The used table type doesn't support FULLTEXT indexes

- Error: 1215 SQLSTATE: HY000 (ER_CANNOT_ADD_FOREIGN)

  Message: Cannot add foreign key constraint
- Error: 1216 SQLSTATE: 23000 (ER_NO_REFERENCED_ROW)

  Message: Cannot add or update a child row: a foreign key constraint fails
- Error: 1217 SQLSTATE: 23000 (ER_ROW_IS_REFERENCED)

  Message: Cannot delete or update a parent row: a foreign key constraint fails
- Error: 1218 SQLSTATE: 08S01 (ER_CONNECT_TO_MASTER)

  Message: Error connecting to master: %s
- Error: 1219 SQLSTATE: HY000 (ER_QUERY_ON_MASTER)

  Message: Error running query on master: %s
- Error: 1220 SQLSTATE: HY000 (ER_ERROR_WHEN_EXECUTING_COMMAND)

  Message: Error when executing command %s: %s
- Error: 1221 SQLSTATE: HY000 (ER_WRONG_USAGE)

  Message: Incorrect usage of %s and %s
- Error: 1222 SQLSTATE: 21000 (ER_WRONG_NUMBER_OF_COLUMNS_IN_SELECT)

  Message: The used SELECT statements have a different number of columns
- Error: 1223 SQLSTATE: HY000 (ER_CANT_UPDATE_WITH_READLOCK)

  Message: Can't execute the query because you have a conflicting read lock
- Error: 1224 SQLSTATE: HY000 (ER_MIXING_NOT_ALLOWED)

  Message: Mixing of transactional and non-transactional tables is disabled
- Error: 1225 SQLSTATE: HY000 (ER_DUP_ARGUMENT)

  Message: Option '%s' used twice in statement
- Error: 1226 SQLSTATE: 42000 (ER_USER_LIMIT_REACHED)

  Message: User '%s' has exceeded the '%s' resource (current value: %ld)
- Error: 1227 SQLSTATE: 42000 (ER_SPECIFIC_ACCESS_DENIED_ERROR)

  Message: Access denied; you need (at least one of) the %s privilege(s) for this operation
- Error: 1228 SQLSTATE: HY000 (ER_LOCAL_VARIABLE)

  Message: Variable '%s' is a SESSION variable and can't be used with SET GLOBAL
- Error: 1229 SQLSTATE: HY000 (ER_GLOBAL_VARIABLE)

  Message: Variable '%s' is a GLOBAL variable and should be set with SET GLOBAL
- Error: 1230 SQLSTATE: 42000 (ER_NO_DEFAULT)

  Message: Variable '%s' doesn't have a default value
- Error: 1231 SQLSTATE: 42000 (ER_WRONG_VALUE_FOR_VAR)

  Message: Variable '%s' can't be set to the value of '%s'
- Error: 1232 SQLSTATE: 42000 (ER_WRONG_TYPE_FOR_VAR)

  Message: Incorrect argument type to variable '%s'

- Error: 1233 SQLSTATE: HY000 (ER_VAR_CANT_BE_READ)

  Message: Variable '%s' can only be set, not read
- Error: 1234 SQLSTATE: 42000 (ER_CANT_USE_OPTION_HERE)

  Message: Incorrect usage/placement of '%s'
- Error: 1235 SQLSTATE: 42000 (ER_NOT_SUPPORTED_YET)

  Message: This version of MySQL doesn't yet support '%s'
- Error: 1236 SQLSTATE: HY000 (ER_MASTER_FATAL_ERROR_READING_BINLOG)

  Message: Got fatal error %d from master when reading data from binary log: '%s'
- Error: 1237 SQLSTATE: HY000 (ER_SLAVE_IGNORED_TABLE)

  Message: Slave SQL thread ignored the query because of replicate-*-table rules
- Error: 1238 SQLSTATE: HY000 (ER_INCORRECT_GLOBAL_LOCAL_VAR)

  Message: Variable '%s' is a %s variable
- Error: 1239 SQLSTATE: 42000 (ER_WRONG_FK_DEF)

  Message: Incorrect foreign key definition for '%s': %s
- Error: 1240 SQLSTATE: HY000 (ER_KEY_REF_DO_NOT_MATCH_TABLE_REF)

  Message: Key reference and table reference don't match
- Error: 1241 SQLSTATE: 21000 (ER_OPERAND_COLUMNS)

  Message: Operand should contain %d column(s)
- Error: 1242 SQLSTATE: 21000 (ER_SUBQUERY_NO_1_ROW)

  Message: Subquery returns more than 1 row
- Error: 1243 SQLSTATE: HY000 (ER_UNKNOWN_STMT_HANDLER)

  Message: Unknown prepared statement handler (%.*s) given to %s
- Error: 1244 SQLSTATE: HY000 (ER_CORRUPT_HELP_DB)

  Message: Help database is corrupt or does not exist
- Error: 1245 SQLSTATE: HY000 (ER_CYCLIC_REFERENCE)

  Message: Cyclic reference on subqueries
- Error: 1246 SQLSTATE: HY000 (ER_AUTO_CONVERT)

  Message: Converting column '%s' from %s to %s
- Error: 1247 SQLSTATE: 42S22 (ER_ILLEGAL_REFERENCE)

  Message: Reference '%s' not supported (%s)
- Error: 1248 SQLSTATE: 42000 (ER_DERIVED_MUST_HAVE_ALIAS)

  Message: Every derived table must have its own alias
- Error: 1249 SQLSTATE: 01000 (ER_SELECT_REDUCED)

  Message: Select %u was reduced during optimization
- Error: 1250 SQLSTATE: 42000 (ER_TABLENAME_NOT_ALLOWED_HERE)

  Message: Too big precision %d specified for column '%s'. Maximum is %lu.

- Error: 1427 SQLSTATE: 42000 (ER_M_BIGGER_THAN_D)

  Message: For float(M,D), double(M,D) or decimal(M,D), M must be >= D (column '%s').

- Error: 1428 SQLSTATE: HY000 (ER_WRONG_LOCK_OF_SYSTEM_TABLE)

  Message: You can't combine write-locking of system tables with other tables or lock types

- Error: 1429 SQLSTATE: HY000 (ER_CONNECT_TO_FOREIGN_DATA_SOURCE)

  Message: Unable to connect to foreign data source: %s

- Error: 1430 SQLSTATE: HY000 (ER_QUERY_ON_FOREIGN_DATA_SOURCE)

  Message: There was a problem processing the query on the foreign data source. Data source error: %s

- Error: 1431 SQLSTATE: HY000 (ER_FOREIGN_DATA_SOURCE_DOESNT_EXIST)

  Message: The foreign data source you are trying to reference does not exist. Data source error: %s

- Error: 1432 SQLSTATE: HY000 (ER_FOREIGN_DATA_STRING_INVALID_CANT_CREATE)

  Message: Can't create federated table. The data source connection string '%s' is not in the correct format

- Error: 1433 SQLSTATE: HY000 (ER_FOREIGN_DATA_STRING_INVALID)

  Message: The data source connection string '%s' is not in the correct format

- Error: 1434 SQLSTATE: HY000 (ER_CANT_CREATE_FEDERATED_TABLE)

  Message: Can't create federated table. Foreign data src error: %s

- Error: 1435 SQLSTATE: HY000 (ER_TRG_IN_WRONG_SCHEMA)

  Message: Trigger in wrong schema

- Error: 1436 SQLSTATE: HY000 (ER_STACK_OVERRUN_NEED_MORE)

  Message: Thread stack overrun: %ld bytes used of a %ld byte stack, and %ld bytes needed. Use 'mysqld --thread_stack=#' to specify a bigger stack.

- Error: 1437 SQLSTATE: 42000 (ER_TOO_LONG_BODY)

  Message: Routine body for '%s' is too long

- Error: 1438 SQLSTATE: HY000 (ER_WARN_CANT_DROP_DEFAULT_KEYCACHE)

  Message: Cannot drop default keycache

- Error: 1439 SQLSTATE: 42000 (ER_TOO_BIG_DISPLAYWIDTH)

  Message: Display width out of range for column '%s' (max = %lu)

- Error: 1440 SQLSTATE: XAE08 (ER_XAER_DUPID)

  Message: XAER_DUPID: The XID already exists

- Error: 1441 SQLSTATE: 22008 (ER_DATETIME_FUNCTION_OVERFLOW)

  Message: Datetime function: %s field overflow

- Error: 1442 SQLSTATE: HY000 (ER_CANT_UPDATE_USED_TABLE_IN_SF_OR_TRG)

  Message: Can't update table '%s' in stored function/trigger because it is already used by statement which invoked this stored function/trigger.

- Error: 1443 SQLSTATE: HY000 (ER_VIEW_PREVENT_UPDATE)

  Message: The definition of table '%s' prevents operation %s on table '%s'.

- Error: 1444 SQLSTATE: HY000 (ER_PS_NO_RECURSION)

  Message: The prepared statement contains a stored routine call that refers to that same statement. It's not allowed to execute a prepared statement in such a recursive manner

- Error: 1445 SQLSTATE: HY000 (ER_SP_CANT_SET_AUTOCOMMIT)

Message: Not allowed to set autocommit from a stored function or trigger

- Error: 1446 SQLSTATE: HY000 (ER_MALFORMED_DEFINER)

  Message: Definer is not fully qualified

- Error: 1447 SQLSTATE: HY000 (ER_VIEW_FRM_NO_USER)

  Message: View '%s'.'%s' has no definer information (old table format). Current user is used as definer. Please recreate the view!

- Error: 1448 SQLSTATE: HY000 (ER_VIEW_OTHER_USER)

  Message: You need the SUPER privilege for creation view with '%s'@'%s' definer

- Error: 1449 SQLSTATE: HY000 (ER_NO_SUCH_USER)

  Message: The user specified as a definer ('%s'@'%s') does not exist

- Error: 1450 SQLSTATE: HY000 (ER_FORBID_SCHEMA_CHANGE)

  Message: Changing schema from '%s' to '%s' is not allowed.

- Error: 1451 SQLSTATE: 23000 (ER_ROW_IS_REFERENCED_2)

  Message: Cannot delete or update a parent row: a foreign key constraint fails (%s)

- Error: 1452 SQLSTATE: 23000 (ER_NO_REFERENCED_ROW_2)

  Message: Cannot add or update a child row: a foreign key constraint fails (%s)

- Error: 1453 SQLSTATE: 42000 (ER_SP_BAD_VAR_SHADOW)

  Message: Variable '%s' must be quoted with `...`, or renamed

- Error: 1454 SQLSTATE: HY000 (ER_TRG_NO_DEFINER)

  Message: No definer attribute for trigger '%s'.'%s'. The trigger will be activated under the authorization of the invoker, which may have insufficient privileges. Please recreate the trigger.

- Error: 1455 SQLSTATE: HY000 (ER_OLD_FILE_FORMAT)

  Message: '%s' has an old format, you should re-create the '%s' object(s)

- Error: 1456 SQLSTATE: HY000 (ER_SP_RECURSION_LIMIT)

  Message: Recursive limit %d (as set by the max_sp_recursion_depth variable) was exceeded for routine %s

- Error: 1457 SQLSTATE: HY000 (ER_SP_PROC_TABLE_CORRUPT)

  Message: Failed to load routine %s. The table mysql.proc is missing, corrupt, or contains bad data (internal code %d)

- Error: 1458 SQLSTATE: 42000 (ER_SP_WRONG_NAME)

  Message: Incorrect routine name '%s'

- Error: 1459 SQLSTATE: HY000 (ER_TABLE_NEEDS_UPGRADE)

  Message: Table upgrade required. Please do "REPAIR TABLE `%s`" or dump/reload to fix it!

- Error: 1460 SQLSTATE: 42000 (ER_SP_NO_AGGREGATE)

  Message: AGGREGATE is not supported for stored functions

- Error: 1461 SQLSTATE: 42000 (ER_MAX_PREPARED_STMT_COUNT_REACHED)

  Message: Can't create more than max_prepared_stmt_count statements (current value: %lu)

- Error: 1462 SQLSTATE: HY000 (ER_VIEW_RECURSIVE)

  Message: `%s`.`%s` contains view recursion

- Error: 1463 SQLSTATE: 42000 (ER_NON_GROUPING_FIELD_USED)

  Message: Non-grouping field '%s' is used in %s clause

- Error: 1464 SQLSTATE: HY000 (ER_TABLE_CANT_HANDLE_SPKEYS)

  Message: The used table type doesn't support SPATIAL indexes

- Error: 1465 SQLSTATE: HY000 (ER_NO_TRIGGERS_ON_SYSTEM_SCHEMA)

  Message: Triggers can not be created on system tables

- Error: 1466 SQLSTATE: HY000 (ER_REMOVED_SPACES)

  Message: Leading spaces are removed from name '%s'

- Error: 1467 SQLSTATE: HY000 (ER_AUTOINC_READ_FAILED)

  Message: Failed to read auto-increment value from storage engine

- Error: 1468 SQLSTATE: HY000 (ER_USERNAME)

  Message: user name

- Error: 1469 SQLSTATE: HY000 (ER_HOSTNAME)

  Message: host name

- Error: 1470 SQLSTATE: HY000 (ER_WRONG_STRING_LENGTH)

  Message: String '%s' is too long for %s (should be no longer than %d)

- Error: 1471 SQLSTATE: HY000 (ER_NON_INSERTABLE_TABLE)

  Message: The target table %s of the %s is not insertable-into

- Error: 1472 SQLSTATE: HY000 (ER_ADMIN_WRONG_MRG_TABLE)

  Message: Table '%s' is differently defined or of non-MyISAM type or doesn't exist

- Error: 1473 SQLSTATE: HY000 (ER_TOO_HIGH_LEVEL_OF_NESTING_FOR_SELECT)

  Message: Too high level of nesting for select

- Error: 1474 SQLSTATE: HY000 (ER_NAME_BECOMES_EMPTY)

  Message: Name '%s' has become ''

- Error: 1475 SQLSTATE: HY000 (ER_AMBIGUOUS_FIELD_TERM)

  Message: First character of the FIELDS TERMINATED string is ambiguous; please use non-optional and non-empty FIELDS ENCLOSED BY

- Error: 1476 SQLSTATE: HY000 (ER_FOREIGN_SERVER_EXISTS)

  Message: The foreign server, %s, you are trying to create already exists.

- Error: 1477 SQLSTATE: HY000 (ER_FOREIGN_SERVER_DOESNT_EXIST)

  Message: The foreign server name you are trying to reference does not exist. Data source error: %s

- Error: 1478 SQLSTATE: HY000 (ER_ILLEGAL_HA_CREATE_OPTION)

  Message: Table storage engine '%s' does not support the create option '%s'

- Error: 1479 SQLSTATE: HY000 (ER_PARTITION_REQUIRES_VALUES_ERROR)

  Message: Syntax error: %s PARTITIONING requires definition of VALUES %s for each partition

- Error: 1480 SQLSTATE: HY000 (ER_PARTITION_WRONG_VALUES_ERROR)

  Message: Only %s PARTITIONING can use VALUES %s in partition definition

- Error: 1481 SQLSTATE: HY000 (ER_PARTITION_MAXVALUE_ERROR)

  Message: MAXVALUE can only be used in last partition definition
- Error: 1482 SQLSTATE: HY000 (ER_PARTITION_SUBPARTITION_ERROR)

  Message: Subpartitions can only be hash partitions and by key
- Error: 1483 SQLSTATE: HY000 (ER_PARTITION_SUBPART_MIX_ERROR)

  Message: Must define subpartitions on all partitions if on one partition
- Error: 1484 SQLSTATE: HY000 (ER_PARTITION_WRONG_NO_PART_ERROR)

  Message: Wrong number of partitions defined, mismatch with previous setting
- Error: 1485 SQLSTATE: HY000 (ER_PARTITION_WRONG_NO_SUBPART_ERROR)

  Message: Wrong number of subpartitions defined, mismatch with previous setting
- Error: 1486 SQLSTATE: HY000 (ER_WRONG_EXPR_IN_PARTITION_FUNC_ERROR)

  Message: Constant, random or timezone-dependent expressions in (sub)partitioning function are not allowed
- Error: 1487 SQLSTATE: HY000 (ER_NO_CONST_EXPR_IN_RANGE_OR_LIST_ERROR)

  Message: Expression in RANGE/LIST VALUES must be constant
- Error: 1488 SQLSTATE: HY000 (ER_FIELD_NOT_FOUND_PART_ERROR)

  Message: Field in list of fields for partition function not found in table
- Error: 1489 SQLSTATE: HY000 (ER_LIST_OF_FIELDS_ONLY_IN_HASH_ERROR)

  Message: List of fields is only allowed in KEY partitions
- Error: 1490 SQLSTATE: HY000 (ER_INCONSISTENT_PARTITION_INFO_ERROR)

  Message: The partition info in the frm file is not consistent with what can be written into the frm file
- Error: 1491 SQLSTATE: HY000 (ER_PARTITION_FUNC_NOT_ALLOWED_ERROR)

  Message: The %s function returns the wrong type
- Error: 1492 SQLSTATE: HY000 (ER_PARTITIONS_MUST_BE_DEFINED_ERROR)

  Message: For %s partitions each partition must be defined
- Error: 1493 SQLSTATE: HY000 (ER_RANGE_NOT_INCREASING_ERROR)

  Message: VALUES LESS THAN value must be strictly increasing for each partition
- Error: 1494 SQLSTATE: HY000 (ER_INCONSISTENT_TYPE_OF_FUNCTIONS_ERROR)

  Message: VALUES value must be of same type as partition function
- Error: 1495 SQLSTATE: HY000 (ER_MULTIPLE_DEF_CONST_IN_LIST_PART_ERROR)

  Message: Multiple definition of same constant in list partitioning
- Error: 1496 SQLSTATE: HY000 (ER_PARTITION_ENTRY_ERROR)

  Message: Partitioning can not be used stand-alone in query
- Error: 1497 SQLSTATE: HY000 (ER_MIX_HANDLER_ERROR)

  Message: The mix of handlers in the partitions is not allowed in this version of MySQL
- Error: 1498 SQLSTATE: HY000 (ER_PARTITION_NOT_DEFINED_ERROR)

  Message: For the partitioned engine it is necessary to define all %s

- Error: 1499 SQLSTATE: HY000 (ER_TOO_MANY_PARTITIONS_ERROR)

  Message: Too many partitions (including subpartitions) were defined
- Error: 1500 SQLSTATE: HY000 (ER_SUBPARTITION_ERROR)

  Message: It is only possible to mix RANGE/LIST partitioning with HASH/KEY partitioning for subpartitioning
- Error: 1501 SQLSTATE: HY000 (ER_CANT_CREATE_HANDLER_FILE)

  Message: Failed to create specific handler file
- Error: 1502 SQLSTATE: HY000 (ER_BLOB_FIELD_IN_PART_FUNC_ERROR)

  Message: A BLOB field is not allowed in partition function
- Error: 1503 SQLSTATE: HY000 (ER_UNIQUE_KEY_NEED_ALL_FIELDS_IN_PF)

  Message: A %s must include all columns in the table's partitioning function
- Error: 1504 SQLSTATE: HY000 (ER_NO_PARTS_ERROR)

  Message: Number of %s = 0 is not an allowed value
- Error: 1505 SQLSTATE: HY000 (ER_PARTITION_MGMT_ON_NONPARTITIONED)

  Message: Partition management on a not partitioned table is not possible
- Error: 1506 SQLSTATE: HY000 (ER_FOREIGN_KEY_ON_PARTITIONED)

  Message: Foreign key clause is not yet supported in conjunction with partitioning
- Error: 1507 SQLSTATE: HY000 (ER_DROP_PARTITION_NON_EXISTENT)

  Message: Error in list of partitions to %s
- Error: 1508 SQLSTATE: HY000 (ER_DROP_LAST_PARTITION)

  Message: Cannot remove all partitions, use DROP TABLE instead
- Error: 1509 SQLSTATE: HY000 (ER_COALESCE_ONLY_ON_HASH_PARTITION)

  Message: COALESCE PARTITION can only be used on HASH/KEY partitions
- Error: 1510 SQLSTATE: HY000 (ER_REORG_HASH_ONLY_ON_SAME_NO)

  Message: REORGANIZE PARTITION can only be used to reorganize partitions not to change their numbers
- Error: 1511 SQLSTATE: HY000 (ER_REORG_NO_PARAM_ERROR)

  Message: REORGANIZE PARTITION without parameters can only be used on auto-partitioned tables using HASH PARTITIONs
- Error: 1512 SQLSTATE: HY000 (ER_ONLY_ON_RANGE_LIST_PARTITION)

  Message: %s PARTITION can only be used on RANGE/LIST partitions
- Error: 1513 SQLSTATE: HY000 (ER_ADD_PARTITION_SUBPART_ERROR)

  Message: Trying to Add partition(s) with wrong number of subpartitions
- Error: 1514 SQLSTATE: HY000 (ER_ADD_PARTITION_NO_NEW_PARTITION)

  Message: At least one partition must be added
- Error: 1515 SQLSTATE: HY000 (ER_COALESCE_PARTITION_NO_PARTITION)

  Message: At least one partition must be coalesced
- Error: 1516 SQLSTATE: HY000 (ER_REORG_PARTITION_NOT_EXIST)

  Message: More partitions to reorganize than there are partitions

- Error: 1517 SQLSTATE: HY000 (ER_SAME_NAME_PARTITION)

  Message: Duplicate partition name %s
- Error: 1518 SQLSTATE: HY000 (ER_NO_BINLOG_ERROR)

  Message: It is not allowed to shut off binlog on this command
- Error: 1519 SQLSTATE: HY000 (ER_CONSECUTIVE_REORG_PARTITIONS)

  Message: When reorganizing a set of partitions they must be in consecutive order
- Error: 1520 SQLSTATE: HY000 (ER_REORG_OUTSIDE_RANGE)

  Message: Reorganize of range partitions cannot change total ranges except for last partition where it can extend the range
- Error: 1521 SQLSTATE: HY000 (ER_PARTITION_FUNCTION_FAILURE)

  Message: Partition function not supported in this version for this handler
- Error: 1522 SQLSTATE: HY000 (ER_PART_STATE_ERROR)

  Message: Partition state cannot be defined from CREATE/ALTER TABLE
- Error: 1523 SQLSTATE: HY000 (ER_LIMITED_PART_RANGE)

  Message: The %s handler only supports 32 bit integers in VALUES
- Error: 1524 SQLSTATE: HY000 (ER_PLUGIN_IS_NOT_LOADED)

  Message: Plugin '%s' is not loaded
- Error: 1525 SQLSTATE: HY000 (ER_WRONG_VALUE)

  Message: Incorrect %s value: '%s'
- Error: 1526 SQLSTATE: HY000 (ER_NO_PARTITION_FOR_GIVEN_VALUE)

  Message: Table has no partition for value %s
- Error: 1527 SQLSTATE: HY000 (ER_FILEGROUP_OPTION_ONLY_ONCE)

  Message: It is not allowed to specify %s more than once
- Error: 1528 SQLSTATE: HY000 (ER_CREATE_FILEGROUP_FAILED)

  Message: Failed to create %s
- Error: 1529 SQLSTATE: HY000 (ER_DROP_FILEGROUP_FAILED)

  Message: Failed to drop %s
- Error: 1530 SQLSTATE: HY000 (ER_TABLESPACE_AUTO_EXTEND_ERROR)

  Message: The handler doesn't support autoextend of tablespaces
- Error: 1531 SQLSTATE: HY000 (ER_WRONG_SIZE_NUMBER)

  Message: A size parameter was incorrectly specified, either number or on the form 10M
- Error: 1532 SQLSTATE: HY000 (ER_SIZE_OVERFLOW_ERROR)

  Message: The size number was correct but we don't allow the digit part to be more than 2 billion
- Error: 1533 SQLSTATE: HY000 (ER_ALTER_FILEGROUP_FAILED)

  Message: Failed to alter: %s
- Error: 1534 SQLSTATE: HY000 (ER_BINLOG_ROW_LOGGING_FAILED)

  Message: Writing one row to the row-based binary log failed

- Error: 1535 SQLSTATE: HY000 (ER_BINLOG_ROW_WRONG_TABLE_DEF)

  Message: Table definition on master and slave does not match: %s

- Error: 1536 SQLSTATE: HY000 (ER_BINLOG_ROW_RBR_TO_SBR)

  Message: Slave running with --log-slave-updates must use row-based binary logging to be able to replicate row-based binary log events

- Error: 1537 SQLSTATE: HY000 (ER_EVENT_ALREADY_EXISTS)

  Message: Event '%s' already exists

- Error: 1538 SQLSTATE: HY000 (ER_EVENT_STORE_FAILED)

  Message: Failed to store event %s. Error code %d from storage engine.

- Error: 1539 SQLSTATE: HY000 (ER_EVENT_DOES_NOT_EXIST)

  Message: Unknown event '%s'

- Error: 1540 SQLSTATE: HY000 (ER_EVENT_CANT_ALTER)

  Message: Failed to alter event '%s'

- Error: 1541 SQLSTATE: HY000 (ER_EVENT_DROP_FAILED)

  Message: Failed to drop %s

- Error: 1542 SQLSTATE: HY000 (ER_EVENT_INTERVAL_NOT_POSITIVE_OR_TOO_BIG)

  Message: INTERVAL is either not positive or too big

- Error: 1543 SQLSTATE: HY000 (ER_EVENT_ENDS_BEFORE_STARTS)

  Message: ENDS is either invalid or before STARTS

- Error: 1544 SQLSTATE: HY000 (ER_EVENT_EXEC_TIME_IN_THE_PAST)

  Message: Event execution time is in the past. Event has been disabled

- Error: 1545 SQLSTATE: HY000 (ER_EVENT_OPEN_TABLE_FAILED)

  Message: Failed to open mysql.event

- Error: 1546 SQLSTATE: HY000 (ER_EVENT_NEITHER_M_EXPR_NOR_M_AT)

  Message: No datetime expression provided

- Error: 1547 SQLSTATE: HY000 (ER_COL_COUNT_DOESNT_MATCH_CORRUPTED)

  Message: Column count of mysql.%s is wrong. Expected %d, found %d. The table is probably corrupted

- Error: 1548 SQLSTATE: HY000 (ER_CANNOT_LOAD_FROM_TABLE)

  Message: Cannot load from mysql.%s. The table is probably corrupted

- Error: 1549 SQLSTATE: HY000 (ER_EVENT_CANNOT_DELETE)

  Message: Failed to delete the event from mysql.event

- Error: 1550 SQLSTATE: HY000 (ER_EVENT_COMPILE_ERROR)

  Message: Error during compilation of event's body

- Error: 1551 SQLSTATE: HY000 (ER_EVENT_SAME_NAME)

  Message: Same old and new event name

- Error: 1552 SQLSTATE: HY000 (ER_EVENT_DATA_TOO_LONG)

  Message: Data for column '%s' too long

- Error: 1553 SQLSTATE: HY000 (ER_DROP_INDEX_FK)

  Message: Cannot drop index '%s': needed in a foreign key constraint

- Error: 1554 SQLSTATE: HY000 (ER_WARN_DEPRECATED_SYNTAX_WITH_VER)

  Message: The syntax '%s' is deprecated and will be removed in MySQL %s. Please use %s instead

- Error: 1555 SQLSTATE: HY000 (ER_CANT_WRITE_LOCK_LOG_TABLE)

  Message: You can't write-lock a log table. Only read access is possible

- Error: 1556 SQLSTATE: HY000 (ER_CANT_LOCK_LOG_TABLE)

  Message: You can't use locks with log tables.

- Error: 1557 SQLSTATE: 23000 (ER_FOREIGN_DUPLICATE_KEY)

  Message: Upholding foreign key constraints for table '%s', entry '%s', key %d would lead to a duplicate entry

- Error: 1558 SQLSTATE: HY000 (ER_COL_COUNT_DOESNT_MATCH_PLEASE_UPDATE)

  Message: Column count of mysql.%s is wrong. Expected %d, found %d. Created with MySQL %d, now running %d. Please use mysql_upgrade to fix this error.

- Error: 1559 SQLSTATE: HY000 (ER_TEMP_TABLE_PREVENTS_SWITCH_OUT_OF_RBR)

  Message: Cannot switch out of the row-based binary log format when the session has open temporary tables

- Error: 1560 SQLSTATE: HY000 (ER_STORED_FUNCTION_PREVENTS_SWITCH_BINLOG_FORMAT)

  Message: Cannot change the binary logging format inside a stored function or trigger

- Error: 1561 SQLSTATE: HY000 (ER_NDB_CANT_SWITCH_BINLOG_FORMAT)

  Message: The NDB cluster engine does not support changing the binlog format on the fly yet

- Error: 1562 SQLSTATE: HY000 (ER_PARTITION_NO_TEMPORARY)

  Message: Cannot create temporary table with partitions

- Error: 1563 SQLSTATE: HY000 (ER_PARTITION_CONST_DOMAIN_ERROR)

  Message: Partition constant is out of partition function domain

- Error: 1564 SQLSTATE: HY000 (ER_PARTITION_FUNCTION_IS_NOT_ALLOWED)

  Message: This partition function is not allowed

- Error: 1565 SQLSTATE: HY000 (ER_DDL_LOG_ERROR)

  Message: Error in DDL log

- Error: 1566 SQLSTATE: HY000 (ER_NULL_IN_VALUES_LESS_THAN)

  Message: Not allowed to use NULL value in VALUES LESS THAN

- Error: 1567 SQLSTATE: HY000 (ER_WRONG_PARTITION_NAME)

  Message: Incorrect partition name

- Error: 1568 SQLSTATE: 25001 (ER_CANT_CHANGE_TX_ISOLATION)

  Message: Transaction isolation level can't be changed while a transaction is in progress

- Error: 1569 SQLSTATE: HY000 (ER_DUP_ENTRY_AUTOINCREMENT_CASE)

  Message: ALTER TABLE causes auto_increment resequencing, resulting in duplicate entry '%s' for key '%s'

- Error: 1570 SQLSTATE: HY000 (ER_EVENT_MODIFY_QUEUE_ERROR)

  Message: Internal scheduler error %d

- Error: 1571 SQLSTATE: HY000 (ER_EVENT_SET_VAR_ERROR)

  Message: Error during starting/stopping of the scheduler. Error code %u

- Error: 1572 SQLSTATE: HY000 (ER_PARTITION_MERGE_ERROR)

  Message: Engine cannot be used in partitioned tables

- Error: 1573 SQLSTATE: HY000 (ER_CANT_ACTIVATE_LOG)

  Message: Cannot activate '%s' log

- Error: 1574 SQLSTATE: HY000 (ER_RBR_NOT_AVAILABLE)

  Message: The server was not built with row-based replication

- Error: 1575 SQLSTATE: HY000 (ER_BASE64_DECODE_ERROR)

  Message: Decoding of base64 string failed

- Error: 1576 SQLSTATE: HY000 (ER_EVENT_RECURSION_FORBIDDEN)

  Message: Recursion of EVENT DDL statements is forbidden when body is present

- Error: 1577 SQLSTATE: HY000 (ER_EVENTS_DB_ERROR)

  Message: Cannot proceed because system tables used by Event Scheduler were found damaged at server start

- Error: 1578 SQLSTATE: HY000 (ER_ONLY_INTEGERS_ALLOWED)

  Message: Only integers allowed as number here

- Error: 1579 SQLSTATE: HY000 (ER_UNSUPORTED_LOG_ENGINE)

  Message: This storage engine cannot be used for log tables"

- Error: 1580 SQLSTATE: HY000 (ER_BAD_LOG_STATEMENT)

  Message: You cannot '%s' a log table if logging is enabled

- Error: 1581 SQLSTATE: HY000 (ER_CANT_RENAME_LOG_TABLE)

  Message: Cannot rename '%s'. When logging enabled, rename to/from log table must rename two tables: the log table to an archive table and another table back to '%s'

- Error: 1582 SQLSTATE: 42000 (ER_WRONG_PARAMCOUNT_TO_NATIVE_FCT)

  Message: Incorrect parameter count in the call to native function '%s'

- Error: 1583 SQLSTATE: 42000 (ER_WRONG_PARAMETERS_TO_NATIVE_FCT)

  Message: Incorrect parameters in the call to native function '%s'

- Error: 1584 SQLSTATE: 42000 (ER_WRONG_PARAMETERS_TO_STORED_FCT)

  Message: Incorrect parameters in the call to stored function '%s'

- Error: 1585 SQLSTATE: HY000 (ER_NATIVE_FCT_NAME_COLLISION)

  Message: This function '%s' has the same name as a native function

- Error: 1586 SQLSTATE: 23000 (ER_DUP_ENTRY_WITH_KEY_NAME)

  Message: Duplicate entry '%s' for key '%s'

- Error: 1587 SQLSTATE: HY000 (ER_BINLOG_PURGE_EMFILE)

  Message: Too many files opened, please execute the command again

- Error: 1588 SQLSTATE: HY000 (ER_EVENT_CANNOT_CREATE_IN_THE_PAST)

  Message: Event execution time is in the past and ON COMPLETION NOT PRESERVE is set. The event was dropped immedi-

ately after creation.

- Error: 1589 SQLSTATE: HY000 (ER_EVENT_CANNOT_ALTER_IN_THE_PAST)

  Message: Event execution time is in the past and ON COMPLETION NOT PRESERVE is set. The event was dropped immediately after creation.

- Error: 1599 SQLSTATE: HY000 (ER_VIEW_NO_CREATION_CTX)

  Message: View `%s`.`%s` has no creation context

- Error: 1600 SQLSTATE: HY000 (ER_VIEW_INVALID_CREATION_CTX)

  Message: Creation context of view `%s`.`%s' is invalid

- Error: 1601 SQLSTATE: HY000 (ER_SR_INVALID_CREATION_CTX)

  Message: Creation context of stored routine `%s`.`%s` is invalid

- Error: 1602 SQLSTATE: HY000 (ER_TRG_CORRUPTED_FILE)

  Message: Corrupted TRG file for table `%s`.`%s`

- Error: 1603 SQLSTATE: HY000 (ER_TRG_NO_CREATION_CTX)

  Message: Triggers for table `%s`.`%s` have no creation context

- Error: 1604 SQLSTATE: HY000 (ER_TRG_INVALID_CREATION_CTX)

  Message: Trigger creation context of table `%s`.`%s` is invalid

- Error: 1605 SQLSTATE: HY000 (ER_EVENT_INVALID_CREATION_CTX)

  Message: Creation context of event `%s`.`%s` is invalid

- Error: 1606 SQLSTATE: HY000 (ER_TRG_CANT_OPEN_TABLE)

  Message: Cannot open table for trigger `%s`.`%s`
- Error: 1607 SQLSTATE: HY000 (ER_CANT_CREATE_SROUTINE)

  Message: Cannot create stored routine `%s`. Check warnings
- Error: 1608 SQLSTATE: HY000 (ER_NEVER_USED)

  Message: Ambiguous slave modes combination. %s
- Error: 1609 SQLSTATE: HY000 (ER_NO_FORMAT_DESCRIPTION_EVENT_BEFORE_BINLOG_STATEMENT)

  Message: The BINLOG statement of type `%s` was not preceded by a format description BINLOG statement.
- Error: 1610 SQLSTATE: HY000 (ER_SLAVE_CORRUPT_EVENT)

  Message: Corrupted replication event was detected
- Error: 1611 SQLSTATE: HY000 (ER_LOAD_DATA_INVALID_COLUMN)

  Message: Invalid column reference (%s) in LOAD DATA
- Error: 1612 SQLSTATE: HY000 (ER_LOG_PURGE_NO_FILE)

  Message: Being purged log %s was not found
- Error: 1613 SQLSTATE: XA106 (ER_XA_RBTIMEOUT)

  Message: XA_RBTIMEOUT: Transaction branch was rolled back: took too long
- Error: 1614 SQLSTATE: XA102 (ER_XA_RBDEADLOCK)

  Message: XA_RBDEADLOCK: Transaction branch was rolled back: deadlock was detected
- Error: 1615 SQLSTATE: HY000 (ER_NEED_REPREPARE)

  Message: Prepared statement needs to be re-prepared
- Error: 1616 SQLSTATE: HY000 (ER_DELAYED_NOT_SUPPORTED)

  Message: DELAYED option not supported for table '%s'
- Error: 1617 SQLSTATE: HY000 (WARN_NO_MASTER_INFO)

  Message: The master info structure does not exist
- Error: 1618 SQLSTATE: HY000 (WARN_OPTION_IGNORED)

  Message: <%s> option ignored
- Error: 1619 SQLSTATE: HY000 (WARN_PLUGIN_DELETE_BUILTIN)

  Message: Built-in plugins cannot be deleted
- Error: 1620 SQLSTATE: HY000 (WARN_PLUGIN_BUSY)

  Message: Plugin is busy and will be uninstalled on shutdown
- Error: 1621 SQLSTATE: HY000 (ER_VARIABLE_IS_READONLY)

  Message: %s variable '%s' is read-only. Use SET %s to assign the value
- Error: 1622 SQLSTATE: HY000 (ER_WARN_ENGINE_TRANSACTION_ROLLBACK)

  Message: Storage engine %s does not support rollback for this statement. Transaction rolled back and must be restarted
- Error: 1623 SQLSTATE: HY000 (ER_SLAVE_HEARTBEAT_FAILURE)

  Message: Unexpected master's heartbeat data: %s

- Error: 1624 SQLSTATE: HY000 (ER_SLAVE_HEARTBEAT_VALUE_OUT_OF_RANGE)

  Message: The requested value for the heartbeat period is either negative or exceeds the maximum allowed (%s seconds).
- Error: 1625 SQLSTATE: HY000 (ER_NDB_REPLICATION_SCHEMA_ERROR)

  Message: Bad schema for mysql.ndb_replication table. Message: %s
- Error: 1626 SQLSTATE: HY000 (ER_CONFLICT_FN_PARSE_ERROR)

  Message: Error in parsing conflict function. Message: %s
- Error: 1627 SQLSTATE: HY000 (ER_EXCEPTIONS_WRITE_ERROR)

  Message: Write to exceptions table failed. Message: %s"
- Error: 1628 SQLSTATE: HY000 (ER_TOO_LONG_TABLE_COMMENT)

  Message: Comment for table '%s' is too long (max = %lu)
- Error: 1629 SQLSTATE: HY000 (ER_TOO_LONG_FIELD_COMMENT)

  Message: Comment for field '%s' is too long (max = %lu)
- Error: 1630 SQLSTATE: 42000 (ER_FUNC_INEXISTENT_NAME_COLLISION)

  Message: FUNCTION %s does not exist. Check the 'Function Name Parsing and Resolution' section in the Reference Manual
- Error: 1631 SQLSTATE: HY000 (ER_DATABASE_NAME)

  Message: Database
- Error: 1632 SQLSTATE: HY000 (ER_TABLE_NAME)

  Message: Table
- Error: 1633 SQLSTATE: HY000 (ER_PARTITION_NAME)

  Message: Partition
- Error: 1634 SQLSTATE: HY000 (ER_SUBPARTITION_NAME)

  Message: Subpartition
- Error: 1635 SQLSTATE: HY000 (ER_TEMPORARY_NAME)

  Message: Temporary
- Error: 1636 SQLSTATE: HY000 (ER_RENAMED_NAME)

  Message: Renamed
- Error: 1637 SQLSTATE: HY000 (ER_TOO_MANY_CONCURRENT_TRXS)

  Message: Too many active concurrent transactions
- Error: 1638 SQLSTATE: HY000 (WARN_NON_ASCII_SEPARATOR_NOT_IMPLEMENTED)

  Message: Non-ASCII separator arguments are not fully supported
- Error: 1639 SQLSTATE: HY000 (ER_DEBUG_SYNC_TIMEOUT)

  Message: debug sync point wait timed out
- Error: 1640 SQLSTATE: HY000 (ER_DEBUG_SYNC_HIT_LIMIT)

  Message: debug sync point hit limit reached
- Error: 1641 SQLSTATE: 42000 (ER_DUP_SIGNAL_SET)

  Message: Duplicate condition information item '%s'

- Error: 1642 SQLSTATE: 01000 (ER_SIGNAL_WARN)

  Message: Unhandled user-defined warning condition
- Error: 1643 SQLSTATE: 02000 (ER_SIGNAL_NOT_FOUND)

  Message: Unhandled user-defined not found condition
- Error: 1644 SQLSTATE: HY000 (ER_SIGNAL_EXCEPTION)

  Message: Unhandled user-defined exception condition
- Error: 1645 SQLSTATE: 0K000 (ER_RESIGNAL_WITHOUT_ACTIVE_HANDLER)

  Message: RESIGNAL when handler not active
- Error: 1646 SQLSTATE: HY000 (ER_SIGNAL_BAD_CONDITION_TYPE)

  Message: SIGNAL/RESIGNAL can only use a CONDITION defined with SQLSTATE
- Error: 1647 SQLSTATE: HY000 (WARN_COND_ITEM_TRUNCATED)

  Message: Data truncated for condition item '%s'
- Error: 1648 SQLSTATE: HY000 (ER_COND_ITEM_TOO_LONG)

  Message: Data too long for condition item '%s'
- Error: 1649 SQLSTATE: HY000 (ER_UNKNOWN_LOCALE)

  Message: Unknown locale: '%s'
- Error: 1650 SQLSTATE: HY000 (ER_SLAVE_IGNORE_SERVER_IDS)

  Message: The requested server id %d clashes with the slave startup option --replicate-same-server-id
- Error: 1651 SQLSTATE: HY000 (ER_QUERY_CACHE_DISABLED)

  Message: Query cache is disabled; restart the server with query_cache_type=1 to enable it
- Error: 1652 SQLSTATE: HY000 (ER_SAME_NAME_PARTITION_FIELD)

  Message: Duplicate partition field name '%s'
- Error: 1653 SQLSTATE: HY000 (ER_PARTITION_COLUMN_LIST_ERROR)

  Message: Inconsistency in usage of column lists for partitioning
- Error: 1654 SQLSTATE: HY000 (ER_WRONG_TYPE_COLUMN_VALUE_ERROR)

  Message: Partition column values of incorrect type
- Error: 1655 SQLSTATE: HY000 (ER_TOO_MANY_PARTITION_FUNC_FIELDS_ERROR)

  Message: Too many fields in '%s'
- Error: 1656 SQLSTATE: HY000 (ER_MAXVALUE_IN_VALUES_IN)

  Message: Cannot use MAXVALUE as value in VALUES IN
- Error: 1657 SQLSTATE: HY000 (ER_TOO_MANY_VALUES_ERROR)

  Message: Cannot have more than one value for this type of %s partitioning
- Error: 1658 SQLSTATE: HY000 (ER_ROW_SINGLE_PARTITION_FIELD_ERROR)

  Message: Row expressions in VALUES IN only allowed for multi-field column partitioning
- Error: 1659 SQLSTATE: HY000 (ER_FIELD_TYPE_NOT_ALLOWED_AS_PARTITION_FIELD)

  Message: Field '%s' is of a not allowed type for this type of partitioning

- Error: 1660 SQLSTATE: HY000 (ER_PARTITION_FIELDS_TOO_LONG)

  Message: The total length of the partitioning fields is too large

- Error: 1661 SQLSTATE: HY000 (ER_BINLOG_ROW_ENGINE_AND_STMT_ENGINE)

  Message: Cannot execute statement: impossible to write to binary log since both row-incapable engines and statement-incapable engines are involved.

- Error: 1662 SQLSTATE: HY000 (ER_BINLOG_ROW_MODE_AND_STMT_ENGINE)

  Message: Cannot execute statement: impossible to write to binary log since BINLOG_FORMAT = ROW and at least one table uses a storage engine limited to statement-based logging.

- Error: 1663 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_AND_STMT_ENGINE)

  Message: Cannot execute statement: impossible to write to binary log since statement is unsafe, storage engine is limited to statement-based logging, and BINLOG_FORMAT = MIXED. %s

- Error: 1664 SQLSTATE: HY000 (ER_BINLOG_ROW_INJECTION_AND_STMT_ENGINE)

  Message: Cannot execute statement: impossible to write to binary log since statement is in row format and at least one table uses a storage engine limited to statement-based logging.

- Error: 1665 SQLSTATE: HY000 (ER_BINLOG_STMT_MODE_AND_ROW_ENGINE)

  Message: Cannot execute statement: impossible to write to binary log since BINLOG_FORMAT = STATEMENT and at least one table uses a storage engine limited to row-based logging.%s

- Error: 1666 SQLSTATE: HY000 (ER_BINLOG_ROW_INJECTION_AND_STMT_MODE)

  Message: Cannot execute statement: impossible to write to binary log since statement is in row format and BINLOG_FORMAT = STATEMENT.

- Error: 1667 SQLSTATE: HY000 (ER_BINLOG_MULTIPLE_ENGINES_AND_SELF_LOGGING_ENGINE)

  Message: Cannot execute statement: impossible to write to binary log since more than one engine is involved and at least one engine is self-logging.

- Error: 1668 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_LIMIT)

  Message: The statement is unsafe because it uses a LIMIT clause. This is unsafe because the set of rows included cannot be predicted.

- Error: 1669 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_INSERT_DELAYED)

  Message: The statement is unsafe because it uses INSERT DELAYED. This is unsafe because the times when rows are inserted cannot be predicted.

- Error: 1670 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_SYSTEM_TABLE)

  Message: The statement is unsafe because it uses the general log, slow query log, or performance_schema table(s). This is unsafe because system tables may differ on slaves.

- Error: 1671 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_AUTOINC_COLUMNS)

  Message: Statement is unsafe because it invokes a trigger or a stored function that inserts into an AUTO_INCREMENT column. Inserted values cannot be logged correctly.

- Error: 1672 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_UDF)

  Message: Statement is unsafe because it uses a UDF which may not return the same value on the slave.

- Error: 1673 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_SYSTEM_VARIABLE)

  Message: Statement is unsafe because it uses a system variable that may have a different value on the slave.

- Error: 1674 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_SYSTEM_FUNCTION)

  Message: Statement is unsafe because it uses a system function that may return a different value on the slave.

- Error: 1675 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_NONTRANS_AFTER_TRANS)

Message: Statement is unsafe because it accesses a non-transactional table after accessing a transactional table within the same transaction.

- Error: 1676 SQLSTATE: HY000 (ER_MESSAGE_AND_STATEMENT)

  Message: %s Statement: %s

- Error: 1677 SQLSTATE: HY000 (ER_SLAVE_CONVERSION_FAILED)

  Message: Column %d of table '%s.%s' cannot be converted from type '%s' to type '%s'

- Error: 1678 SQLSTATE: HY000 (ER_SLAVE_CANT_CREATE_CONVERSION)

  Message: Can't create conversion table for table '%s.%s'

- Error: 1679 SQLSTATE: HY000 (ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_BINLOG_FORMAT)

  Message: Cannot modify @@session.binlog_format inside a transaction

- Error: 1680 SQLSTATE: HY000 (ER_PATH_LENGTH)

  Message: The path specified for %s is too long.

- Error: 1681 SQLSTATE: HY000 (ER_WARN_DEPRECATED_SYNTAX_NO_REPLACEMENT)

  Message: The syntax '%s' is deprecated and will be removed in MySQL %s.

- Error: 1682 SQLSTATE: HY000 (ER_WRONG_NATIVE_TABLE_STRUCTURE)

  Message: Native table '%s'.'%s' has the wrong structure

- Error: 1683 SQLSTATE: HY000 (ER_WRONG_PERFSCHEMA_USAGE)

  Message: Invalid performance_schema usage.

- Error: 1684 SQLSTATE: HY000 (ER_WARN_I_S_SKIPPED_TABLE)

  Message: Table '%s'.'%s' was skipped since its definition is being modified by concurrent DDL statement

- Error: 1685 SQLSTATE: HY000 (ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_BINLOG_DIRECT)

  Message: Cannot modify @@session.binlog_direct_non_transactional_updates inside a transaction

- Error: 1686 SQLSTATE: HY000 (ER_STORED_FUNCTION_PREVENTS_SWITCH_BINLOG_DIRECT)

  Message: Cannot change the binlog direct flag inside a stored function or trigger

- Error: 1687 SQLSTATE: 42000 (ER_SPATIAL_MUST_HAVE_GEOM_COL)

  Message: A SPATIAL index may only contain a geometrical type column

- Error: 1688 SQLSTATE: HY000 (ER_TOO_LONG_INDEX_COMMENT)

  Message: Comment for index '%s' is too long (max = %lu)

- Error: 1689 SQLSTATE: HY000 (ER_LOCK_ABORTED)

  Message: Wait on a lock was aborted due to a pending exclusive lock

- Error: 1690 SQLSTATE: 22003 (ER_DATA_OUT_OF_RANGE)

  Message: %s value is out of range in '%s'

- Error: 1691 SQLSTATE: HY000 (ER_WRONG_SPVAR_TYPE_IN_LIMIT)

  Message: A variable of a non-integer based type in LIMIT clause

- Error: 1692 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_MULTIPLE_ENGINES_AND_SELF_LOGGING_ENGINE)

  Message: Mixing self-logging and non-self-logging engines in a statement is unsafe.

- Error: 1693 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_MIXED_STATEMENT)

  Message: Statement accesses nontransactional table as well as transactional or temporary table, and writes to any of them.

- Error: 1694 SQLSTATE: HY000 (ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_SQL_LOG_BIN)

  Message: Cannot modify @@session.sql_log_bin inside a transaction

- Error: 1695 SQLSTATE: HY000 (ER_STORED_FUNCTION_PREVENTS_SWITCH_SQL_LOG_BIN)

  Message: Cannot change the sql_log_bin inside a stored function or trigger

- Error: 1696 SQLSTATE: HY000 (ER_FAILED_READ_FROM_PAR_FILE)

  Message: Failed to read from the .par file

- Error: 1697 SQLSTATE: HY000 (ER_VALUES_IS_NOT_INT_TYPE_ERROR)

  Message: VALUES value for partition '%s' must have type INT

- Error: 1698 SQLSTATE: 28000 (ER_ACCESS_DENIED_NO_PASSWORD_ERROR)

  Message: Access denied for user '%s'@'%s'

- Error: 1699 SQLSTATE: HY000 (ER_SET_PASSWORD_AUTH_PLUGIN)

  Message: SET PASSWORD has no significance for users authenticating via plugins

- Error: 1700 SQLSTATE: HY000 (ER_GRANT_PLUGIN_USER_EXISTS)

  Message: GRANT with IDENTIFIED WITH is illegal because the user %-.*s already exists

- Error: 1701 SQLSTATE: 42000 (ER_TRUNCATE_ILLEGAL_FK)

  Message: Cannot truncate a table referenced in a foreign key constraint (%s)

- Error: 1702 SQLSTATE: HY000 (ER_PLUGIN_IS_PERMANENT)

  Message: Plugin '%s' is force_plus_permanent and can not be unloaded

- Error: 1703 SQLSTATE: HY000 (ER_SLAVE_HEARTBEAT_VALUE_OUT_OF_RANGE_MIN)

  Message: The requested value for the heartbeat period is less than 1 millisecond. The value is reset to 0, meaning that heartbeating will effectively be disabled.

- Error: 1704 SQLSTATE: HY000 (ER_SLAVE_HEARTBEAT_VALUE_OUT_OF_RANGE_MAX)

  Message: The requested value for the heartbeat period exceeds the value of `slave_net_timeout' seconds. A sensible value for the period should be less than the timeout.

- Error: 1705 SQLSTATE: HY000 (ER_STMT_CACHE_FULL)

  Message: Multi-row statements required more than 'max_binlog_stmt_cache_size' bytes of storage; increase this mysqld variable and try again

- Error: 1706 SQLSTATE: HY000 (ER_MULTI_UPDATE_KEY_CONFLICT)

  Message: Primary key/partition key update is not allowed since the table is updated both as '%s' and '%s'.

- Error: 1707 SQLSTATE: HY000 (ER_TABLE_NEEDS_REBUILD)

  Message: Table rebuild required. Please do "ALTER TABLE `%s` FORCE" or dump/reload to fix it!

- Error: 1708 SQLSTATE: HY000 (WARN_OPTION_BELOW_LIMIT)

  Message: The value of '%s' should be no less than the value of '%s'

- Error: 1709 SQLSTATE: HY000 (ER_INDEX_COLUMN_TOO_LONG)

  Message: Index column size too large. The maximum column size is %lu bytes.

- Error: 1710 SQLSTATE: HY000 (ER_ERROR_IN_TRIGGER_BODY)

Message: Trigger '%s' has an error in its body: '%s'

- Error: 1711 SQLSTATE: HY000 (ER_ERROR_IN_UNKNOWN_TRIGGER_BODY)

  Message: Unknown trigger has an error in its body: '%s'

- Error: 1712 SQLSTATE: HY000 (ER_INDEX_CORRUPT)

  Message: Index %s is corrupted

- Error: 1713 SQLSTATE: HY000 (ER_UNDO_RECORD_TOO_BIG)

  Message: Undo log record is too big.

- Error: 1714 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_INSERT_IGNORE_SELECT)

  Message: INSERT IGNORE... SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

- Error: 1715 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_INSERT_SELECT_UPDATE)

  Message: INSERT... SELECT... ON DUPLICATE KEY UPDATE is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are updated. This order cannot be predicted and may differ on master and the slave.

- Error: 1716 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_REPLACE_SELECT)

  Message: REPLACE... SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are replaced. This order cannot be predicted and may differ on master and the slave.

- Error: 1717 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_CREATE_IGNORE_SELECT)

  Message: CREATE... IGNORE SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

- Error: 1718 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_CREATE_REPLACE_SELECT)

  Message: CREATE... REPLACE SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are replaced. This order cannot be predicted and may differ on master and the slave.

- Error: 1719 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_UPDATE_IGNORE)

  Message: UPDATE IGNORE is unsafe because the order in which rows are updated determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

- Error: 1720 SQLSTATE: HY000 (ER_PLUGIN_NO_UNINSTALL)

  Message: Plugin '%s' is marked as not dynamically uninstallable. You have to stop the server to uninstall it.

- Error: 1721 SQLSTATE: HY000 (ER_PLUGIN_NO_INSTALL)

  Message: Plugin '%s' is marked as not dynamically installable. You have to stop the server to install it.

- Error: 1722 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_WRITE_AUTOINC_SELECT)

  Message: Statements writing to a table with an auto-increment column after selecting from another table are unsafe because the order in which rows are retrieved determines what (if any) rows will be written. This order cannot be predicted and may differ on master and the slave.

- Error: 1723 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_CREATE_SELECT_AUTOINC)

  Message: CREATE TABLE... SELECT... on a table with an auto-increment column is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are inserted. This order cannot be predicted and may differ on master and the slave.

C.4. Client Error Codes and Messages

Client error information comes from the following source files:

- The Error values and the symbols in parentheses correspond to definitions in the `include/errmsg.h` MySQL source file.
- The Message values correspond to the error messages that are listed in the `libmysql/errmsg.c` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: `2000` (`CR_UNKNOWN_ERROR`)

  Message: Unknown MySQL error
- Error: `2001` (`CR_SOCKET_CREATE_ERROR`)

  Message: Can't create UNIX socket (%d)
- Error: `2002` (`CR_CONNECTION_ERROR`)

  Message: Can't connect to local MySQL server through socket '%s' (%d)
- Error: `2003` (`CR_CONN_HOST_ERROR`)

  Message: Can't connect to MySQL server on '%s' (%d)
- Error: `2004` (`CR_IPSOCK_ERROR`)

  Message: Can't create TCP/IP socket (%d)
- Error: `2005` (`CR_UNKNOWN_HOST`)

  Message: Unknown MySQL server host '%s' (%d)
- Error: `2006` (`CR_SERVER_GONE_ERROR`)

  Message: MySQL server has gone away
- Error: `2007` (`CR_VERSION_ERROR`)

  Message: Protocol mismatch; server version = %d, client version = %d
- Error: `2008` (`CR_OUT_OF_MEMORY`)

  Message: MySQL client ran out of memory
- Error: `2009` (`CR_WRONG_HOST_INFO`)

  Message: Wrong host info
- Error: `2010` (`CR_LOCALHOST_CONNECTION`)

  Message: Localhost via UNIX socket
- Error: `2011` (`CR_TCP_CONNECTION`)

  Message: %s via TCP/IP
- Error: `2012` (`CR_SERVER_HANDSHAKE_ERR`)

  Message: Error in server handshake
- Error: `2013` (`CR_SERVER_LOST`)

  Message: Lost connection to MySQL server during query
- Error: `2014` (`CR_COMMANDS_OUT_OF_SYNC`)

  Message: Commands out of sync; you can't run this command now
- Error: `2015` (`CR_NAMEDPIPE_CONNECTION`)

  Message: Named pipe: %s

- Error: `2016` (`CR_NAMEDPIPEWAIT_ERROR`)

  Message: Can't wait for named pipe to host: %s pipe: %s (%lu)
- Error: `2017` (`CR_NAMEDPIPEOPEN_ERROR`)

  Message: Can't open named pipe to host: %s pipe: %s (%lu)
- Error: `2018` (`CR_NAMEDPIPESETSTATE_ERROR`)

  Message: Can't set state of named pipe to host: %s pipe: %s (%lu)
- Error: `2019` (`CR_CANT_READ_CHARSET`)

  Message: Can't initialize character set %s (path: %s)
- Error: `2020` (`CR_NET_PACKET_TOO_LARGE`)

  Message: Got packet bigger than 'max_allowed_packet' bytes
- Error: `2021` (`CR_EMBEDDED_CONNECTION`)

  Message: Embedded server
- Error: `2022` (`CR_PROBE_SLAVE_STATUS`)

  Message: Error on SHOW SLAVE STATUS:
- Error: `2023` (`CR_PROBE_SLAVE_HOSTS`)

  Message: Error on SHOW SLAVE HOSTS:
- Error: `2024` (`CR_PROBE_SLAVE_CONNECT`)

  Message: Error connecting to slave:
- Error: `2025` (`CR_PROBE_MASTER_CONNECT`)

  Message: Error connecting to master:
- Error: `2026` (`CR_SSL_CONNECTION_ERROR`)

  Message: SSL connection error: %s
- Error: `2027` (`CR_MALFORMED_PACKET`)

  Message: Malformed packet
- Error: `2028` (`CR_WRONG_LICENSE`)

  Message: This client library is licensed only for use with MySQL servers having '%s' license
- Error: `2029` (`CR_NULL_POINTER`)

  Message: Invalid use of null pointer
- Error: `2030` (`CR_NO_PREPARE_STMT`)

  Message: Statement not prepared
- Error: `2031` (`CR_PARAMS_NOT_BOUND`)

  Message: No data supplied for parameters in prepared statement
- Error: `2032` (`CR_DATA_TRUNCATED`)

  Message: Data truncated
- Error: `2033` (`CR_NO_PARAMETERS_EXISTS`)

  Message: No parameters exist in the statement

- Error: 2034 (CR_INVALID_PARAMETER_NO)

  Message: Invalid parameter number

- Error: 2035 (CR_INVALID_BUFFER_USE)

  Message: Can't send long data for non-string/non-binary data types (parameter: %d)

- Error: 2036 (CR_UNSUPPORTED_PARAM_TYPE)

  Message: Using unsupported buffer type: %d (parameter: %d)

- Error: 2037 (CR_SHARED_MEMORY_CONNECTION)

  Message: Shared memory: %s

- Error: 2038 (CR_SHARED_MEMORY_CONNECT_REQUEST_ERROR)

  Message: Can't open shared memory; client could not create request event (%lu)

- Error: 2039 (CR_SHARED_MEMORY_CONNECT_ANSWER_ERROR)

  Message: Can't open shared memory; no answer event received from server (%lu)

- Error: 2040 (CR_SHARED_MEMORY_CONNECT_FILE_MAP_ERROR)

  Message: Can't open shared memory; server could not allocate file mapping (%lu)

- Error: 2041 (CR_SHARED_MEMORY_CONNECT_MAP_ERROR)

  Message: Can't open shared memory; server could not get pointer to file mapping (%lu)

- Error: 2042 (CR_SHARED_MEMORY_FILE_MAP_ERROR)

  Message: Can't open shared memory; client could not allocate file mapping (%lu)

- Error: 2043 (CR_SHARED_MEMORY_MAP_ERROR)

  Message: Can't open shared memory; client could not get pointer to file mapping (%lu)

- Error: 2044 (CR_SHARED_MEMORY_EVENT_ERROR)

  Message: Can't open shared memory; client could not create %s event (%lu)

- Error: 2045 (CR_SHARED_MEMORY_CONNECT_ABANDONED_ERROR)

  Message: Can't open shared memory; no answer from server (%lu)

- Error: 2046 (CR_SHARED_MEMORY_CONNECT_SET_ERROR)

  Message: Can't open shared memory; cannot send request event to server (%lu)

- Error: 2047 (CR_CONN_UNKNOW_PROTOCOL)

  Message: Wrong or unknown protocol

- Error: 2048 (CR_INVALID_CONN_HANDLE)

  Message: Invalid connection handle

- Error: 2049 (CR_SECURE_AUTH)

  Message: Connection using old (pre-4.1.1) authentication protocol refused (client option 'secure_auth' enabled)

- Error: 2050 (CR_FETCH_CANCELED)

  Message: Row retrieval was canceled by mysql_stmt_close() call

- Error: 2051 (CR_NO_DATA)

  Message: Attempt to read column without prior row fetch

- Error: 2052 (CR_NO_STMT_METADATA)

  Message: Prepared statement contains no metadata

- Error: 2053 (CR_NO_RESULT_SET)

  Message: Attempt to read a row while there is no result set associated with the statement

- Error: 2054 (CR_NOT_IMPLEMENTED)

  Message: This feature is not implemented yet

- Error: 2055 (CR_SERVER_LOST_EXTENDED)

  Message: Lost connection to MySQL server at '%s', system error: %d

- Error: 2056 (CR_STMT_CLOSED)

  Message: Statement closed indirectly because of a preceeding %s() call

- Error: 2057 (CR_NEW_STMT_METADATA)

  Message: The number of columns in the result set differs from the number of bound buffers. You must reset the statement, re-bind the result set columns, and execute the statement again

- Error: 2058 (CR_ALREADY_CONNECTED)

  Message: This handle is already connected. Use a separate handle for each connection.

- Error: 2059 (CR_AUTH_PLUGIN_CANNOT_LOAD)

  Message: Authentication plugin '%s' cannot be loaded: %s

C.5. Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

C.5.1. How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:

  - The keyboard does not work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light does not change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
  - The mouse pointer does not move.
  - The machine does not answer to a remote machine's pings.
  - Other programs that are not related to MySQL do not behave correctly.
  - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

  In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as glibc) are up to date.

  It is always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing kbd_mode -a.

- Please examine your system log file (/var/log/messages or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See Section 5.2, “MySQL Server Logs”.

- If you do not think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it does not want to die, there is probably a bug in the operating system.

If after you have examined all other possibilities and you have concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report for our mailing list or our support team. In the bug report, try to give a very detailed description of how the system is behaving and what you think is happening. You should also state why you think that MySQL is causing the problem. Take into consideration all the situations in this chapter. State any problems exactly how they appear when you examine your system. Use the "copy and paste" method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only "the system does not work." This provides us with no information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in Section 1.7, "How to Report Bugs or Problems".

C.5.2. Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

C.5.2.1. `Access denied`

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server permits client programs to use when connecting. See Section 5.4, "The MySQL Access Privilege System", and Section 5.4.7, "Causes of Access-Denied Errors".

C.5.2.2. `Can't connect to [local] MySQL server`

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the file system (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you do not specify a host name or if you specify the special host name `localhost`.

If the MySQL server is running on Windows, you can connect using TCP/IP. If the server is started with the `--enable-named-pipe` option, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you do not give a host name when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that does not work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the host name.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on

Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See Section 2.10.1.3, “Starting and Troubleshooting the MySQL Server”.

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. `host_ip` represents the IP address of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotation marks with the `hostname` command; these cause the output of `hostname` (that is, the current host name) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the host name of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with `--skip-networking`, it will not accept TCP/IP connections at all. If the server was started with `--bind-address=127.0.0.1`, it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or the Windows XP personal firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: Section C.5.2.2.1, “`Connection to MySQL Server Failing on Windows`”.
- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See Section C.5.4.5, “How to Protect or Change the MySQL Unix Socket File”.
- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

  ```
  shell> netstat -ln | grep mysql
  ```

  See Section C.5.4.5, “How to Protect or Change the MySQL Unix Socket File”.
- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill` or with the `mysql_zap` script) before you can restart the MySQL server. See Section C.5.4.2, “What to Do If MySQL Keeps Crashing”.
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.

- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)
- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, make sure you have disabled SELinux protection for the `mysqld` process.

C.5.2.2.1. `Connection to MySQL Server Failing on Windows`

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows does not allow for enough ephemeral (short-lived) ports to serve those connections.

The purpose of `TIME_WAIT` is to keep a connection accepting packets even after the connection has been closed. This is because Internet routing can cause a packet to take a slow route to its destination and it may arrive after both sides have agreed to close. If the port is in use for a new connection, that packet from the old connection could break the protocol or compromise personal information from the original connection. The `TIME_WAIT` delay prevents this by ensuring that the port cannot be reused until after some time has been permitted for those delayed packets to arrive.

It is safe to reduce `TIME_WAIT` greatly on LAN connections because there is little chance of packets arriving at very long delays, as they could through the Internet with its comparatively large distances and latencies.

Windows permits ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a `TIME_WAIT` status for 120 seconds. The port will not be available again until this time expires. The default range of port numbers depends on the version of Windows, with a more limited number of ports in older versions:

- Windows through Server 2003: Ports in range 1025–5000
- Windows Vista, Server 2008, and newer: Ports in range 49152–65535

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

IMPORTANT: The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore the registry if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: http://support.microsoft.com/kb/256986/EN-US/.

1. Start Registry Editor (`Regedt32.exe`).
2. Locate the following key in the registry:

   ```
   HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
   ```

3. On the `Edit` menu, click `Add Value`, and then add the following registry value:

   ```
   Value Name: MaxUserPort
   Data Type: REG_DWORD
   Value: 65534
   ```

   This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the `Edit` menu, click `Add Value`, and then add the following registry value:

   ```
   Value Name: TcpTimedWaitDelay
   Data Type: REG_DWORD
   Value: 30
   ```

   This sets the number of seconds to hold a TCP port connection in `TIME_WAIT` state before closing. The valid range is between 0 (zero) and 300 (decimal). The default value is 0x78 (120 decimal).

5. Quit Registry Editor.

6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

C.5.2.3. `Lost connection to MySQL server`

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes “during query,” this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing `net_read_timeout` from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your `connect_timeout` value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using `SHOW GLOBAL STATUS LIKE 'Aborted_connects'`. It will increase by one for each initial connection attempt that the server aborts. You may see “reading authorization packet” as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with `BLOB` values that are larger than `max_allowed_packet`, which can cause this error with some clients. Sometime you may see “packet too large” as part of the error message, and that confirms that you need to increase `max_allowed_packet`.

C.5.2.4. `Client does not support authentication protocol`

MySQL 5.5 uses an authentication protocol based on a password hashing algorithm that is incompatible with that used by older (pre-4.1) clients. If you upgrade the server from 4.0, attempts to connect to it with an older client may fail with the following message:

```
shell> mysql
Client does not support authentication protocol requested
by server; consider upgrading MySQL client
```

To solve this problem, you should use one of the following approaches:

- Upgrade all client programs to use a 4.1.1 or newer client library.
- When connecting to the server with a pre-4.1 client program, use an account that still has a pre-4.1-style password.
- Reset the password to pre-4.1 style for each user that needs to use a pre-4.1 client program. This can be done using the `SET PASSWORD` statement and the `OLD_PASSWORD()` function:

  ```
  mysql> SET PASSWORD FOR
      -> 'some_user'@'some_host' = OLD_PASSWORD('newpwd');
  ```

  Alternatively, use `UPDATE` and `FLUSH PRIVILEGES`:

  ```
  mysql> UPDATE mysql.user SET Password = OLD_PASSWORD('newpwd')
      -> WHERE Host = 'some_host' AND User = 'some_user';
  mysql> FLUSH PRIVILEGES;
  ```

  Substitute the password you want to use for “*newpwd*” in the preceding examples. MySQL cannot tell you what the original password was, so you'll need to pick a new one.

- Tell the server to use the older password hashing algorithm:

  1. Start `mysqld` with the `--old-passwords` option.
  2. Assign an old-format password to each account that has had its password updated to the longer 4.1 format. You can identify these accounts with the following query:

     ```
     mysql> SELECT Host, User, Password FROM mysql.user
         -> WHERE LENGTH(Password) > 16;
     ```

For each account record displayed by the query, use the `Host` and `User` values and assign a password using the `OLD_PASSWORD()` function and either `SET PASSWORD` or `UPDATE`, as described earlier.

> **Note**
>
> In older versions of PHP, the `mysql` extension does not support the authentication protocol in MySQL 4.1.1 and higher. This is true regardless of the PHP version being used. If you wish to use the `mysql` extension with MySQL 4.1 or newer, you may need to follow one of the options discussed above for configuring MySQL to work with old clients. The `mysqli` extension (stands for "MySQL, Improved"; added in PHP 5) is compatible with the improved password hashing employed in MySQL 4.1 and higher, and no special configuration of MySQL need be done to use this MySQL client library. For more information about the `mysqli` extension, see http://php.net/mysqli.

It may also be possible to compile the older `mysql` extension against the new MySQL client library. This is beyond the scope of this Manual; consult the PHP documentation for more information. You also be able to obtain assistance with these issues in our MySQL with PHP forum.

For additional background on password hashing and authentication, see Section 5.3.2.3, “Password Hashing in MySQL”.

C.5.2.5. Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

C.5.2.6. `Host 'host_name' is blocked`

If the following error occurs, it means that `mysqld` has received many connection requests from the given host that were interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqladmin flush-hosts'
```

The value of the `max_connect_errors` system variable determines how many successive interrupted connection requests are permitted. (See Section 5.1.3, “Server System Variables”.) After `max_connect_errors` failed requests without a successful connection, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you issue a `FLUSH HOSTS` statement or execute a `mysqladmin flush-hosts` command.

By default, `mysqld` blocks a host after 10 connection errors. You can adjust the value by setting `max_connect_errors` at server startup:

```
shell> mysqld_safe --max_connect_errors=10000 &
```

The value can also be set at runtime:

```
mysql> SET GLOBAL max_connect_errors=10000;
```

If you get the `Host 'host_name' is blocked` error message for a given host, you should first verify that there is nothing wrong with TCP/IP connections from that host. If you are having network problems, it does you good to increase the value of the `max_connect_errors` variable.

C.5.2.7. `Too many connections`

If you get a `Too many connections` error when you try to connect to the `mysqld` server, this means that all available connections are in use by other clients.

The number of connections permitted is controlled by the `max_connections` system variable. The default value is 151 to improve performance when MySQL is used with the Apache Web server. (Previously, the default was 100.) If you need to support more connections, you should set a larger value for this variable.

`mysqld` actually permits `max_connections+1` clients to connect. The extra connection is reserved for use by accounts that have the `SUPER` privilege. By granting the `SUPER` privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See Section 12.7.5.30, "`SHOW PROCESSLIST` Syntax".

The maximum number of connections MySQL can support depends on the quality of the thread library on a given platform, the amount of RAM available, how much RAM is used for each connection, the workload from each connection, and the desired response time. Linux or Solaris should be able to support at 500 to 1000 simultaneous connections routinely and as many as 10,000 connections if you have many gigabytes of RAM available and the workload from each is low or the response time target undemanding. Windows is limited to (open tables × 2 + open connections) < 2048 due to the Posix compatibility layer used on that platform.

Increasing `open-files-limit` may be necessary. Also see Section 2.5, "Installing MySQL on Linux", for how to raise the operating system limit on how many handles can be used by MySQL.

C.5.2.8. `Out of memory`

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

C.5.2.9. `MySQL server has gone away`

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

Error Code	Description
`CR_SERVER_GONE_ERROR`	The client couldn't send a question to the server.
`CR_SERVER_LOST`	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See Section 5.1.3, "Server System Variables".

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

The problem on Windows is that in some cases MySQL does not get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

The solution to this is to either do a `mysql_ping()` on the connection if there has been a long time since the last query (this is what Connector/ODBC does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 1MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in Section C.5.2.10, “`Packet too large`”.

  An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.

- You also get a lost connection if you are sending a packet 16MB or larger if your client is older than 4.0.8 and your server is 4.0.8 and above, or the other way around.

- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working—from MySQL's point of view the problem is indistinguishable from any other network timeout.

  You may also see the `MySQL server has gone away` error if MySQL is started with the `--skip-networking` option.

  Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.

- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See Section C.5.4.2, “What to Do If MySQL Keeps Crashing”.

You can get more information about the lost connections by starting `mysqld` with the `--log-warnings=2` option. This logs some of the disconnected errors in the `hostname.err` file. See Section 5.2.2, “The Error Log”.

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See Section C.5.4.2, “What to Do If MySQL Keeps Crashing”.

- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See MySQL Internals: Porting.

- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)

- Have you tried to run `mysqld` with the general query log enabled to determine whether the problem query appears in the log? (See Section 5.2.3, “The General Query Log”.)

See also Section C.5.2.11, “Communication Errors and Aborted Connections”, and Section 1.7, “How to Report Bugs or Problems”.

C.5.2.10. `Packet too large`

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

The largest possible packet that can be transmitted to or from a MySQL 5.5 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues a `Packet`

`too large` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 1MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 16MB, start the server like this:

```
shell> mysqld --max_allowed_packet=16M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 16MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=16M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

C.5.2.11. Communication Errors and Aborted Connections

If connection problems occur such as communication errors or aborted connections, use these sources of information to diagnose problems:

- The error log. See Section 5.2.2, “The Error Log”.
- The general query log. See Section 5.2.3, “The General Query Log”.
- The `Aborted_xxx` status variables. See Section 5.1.5, “Server Status Variables”.

If you start the server with the `--log-warnings` option, you might find messages like this in your error log:

```
010301 14:38:23  Aborted connection 854 to db:
'users' user: 'josh'
```

If a client successfully connects but later disconnects improperly or is terminated, the server increments the `Aborted_clients` status variable, and logs an `ABORTED CONNECTION` message to the error log. The cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See Section 5.1.3, “Server System Variables”.
- The client program ended abruptly in the middle of a data transfer.

If a client is unable even to connect, the server increments the `Aborted_connects` status variable. Unsuccessful connect attempts can occur for the following reasons:

- A client does not have privileges to connect to a database.
- A client uses an incorrect password.

- A connection packet does not contain the right information.
- It takes more than `connect_timeout` seconds to get a connect packet. See Section 5.1.3, “Server System Variables”.

If these kinds of things happen, it might indicate that someone is trying to break into your server! Messages for these types of problems are logged to the general query log if it is enabled.

Other reasons for problems with aborted clients or aborted connections:

- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See Section C.5.2.10, “`Packet too large`”.
- Use of Ethernet protocol with Linux, both half and full duplex. Many Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file using FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. Switch the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and test the results to determine the best setting.
- A problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.

See also Section C.5.2.9, “`MySQL server has gone away`”.

C.5.2.12. `The table is full`

If a table-full error occurs, it may be that the disk is full or that the table has reached its maximum size. The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. See Section E.10.3, “Limits on Table Size”.

This error can occur sometimes for MySQL Cluster tables even when there appears to be more than sufficient data memory available. See the documentation for the `DataMemory` MySQL Cluster data node configuration parameter, as well as Section 16.1.2, “MySQL Cluster Nodes, Node Groups, Replicas, and Partitions”, for more information.

C.5.2.13. `Can't create/write to file`

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '\\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See Section 4.2.3.3, “Using Option Files”.

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `perror`. One reason the server cannot write to a table is that the file system is full:

```
shell> perror 28
OS error code  28:  No space left on device
```

If you get an error of the following type during startup, it indicates that the file system or directory used for storing data files is write protected. Providing the write error is to a test file, This error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

C.5.2.14. `Commands out of sync`

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

C.5.2.15. Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system.

The following list indicates possible causes of and fixes for this problem:

- You may be running a new version of `mysqld` with an old `user` table. You can check this by executing `mysqlshow mysql user` to see whether the `Password` column is shorter than 16 characters. If so, you can correct this condition by running the `scripts/add_long_password` script.
- The account has an old password (eight characters long). Update the account in the `user` table to have a new password.
- You have specified a password in the `user` table without using the `PASSWORD()` function. Use `mysql` to update the account in the `user` table with a new password, making sure to use the `PASSWORD()` function:

```
mysql> UPDATE user SET Password=PASSWORD('newpwd')
    -> WHERE User='some_user' AND Host='some_host';
```

C.5.2.16. Table 'tbl_name' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a file system that has case-sensitive file names.
- Even for file systems that are not case sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See Section 12.7.5, “SHOW Syntax”.

C.5.2.17. Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multi-byte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `CMake` with the `-DDEFAULT_CHARSET=charset_name` or `-DWITH_EXTRA_CHARSETS=charset_name` option. See Section 2.9.4, “MySQL Source-Configuration Options”.

  All standard MySQL binaries are compiled with `-DWITH_EXTRA_CHARSETS=all`, which enables support for all multi-byte character sets. See Section 2.9.4, “MySQL Source-Configuration Options”.
- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

- Recompile the client with support for the character set. See Section 2.9.4, “MySQL Source-Configuration Options”.
- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
- Copy the character definition files to the path where the client expects them to be.

C.5.2.18. `'FILE' NOT FOUND` and Similar Errors

If you get `ERROR '...' not found (errno: 23)`, `Can't open file: ... (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you haven't allocated enough file descriptors for the MySQL server. You can use the `perror` utility to get a description of what the error number means:

```
shell> perror 23
OS error code  23:  File table overflow
shell> perror 24
OS error code  24:  Too many open files
shell> perror 11
OS error code  11:  Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). This may not entirely prevent running out of file descriptors because in some circumstances the server may attempt to extend the cache size temporarily, as described in Section 7.4.3.1, “How MySQL Opens and Closes Tables”. Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or set the `open_files_limit` system variable. See Section 5.1.3, “Server System Variables”. The easiest way to set these values is to add an option to your option file. See Section 4.2.3.3, “Using Option Files”. If you have an old version of `mysqld` that does not support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the “`#`” character to uncomment this line, and change the number `256` to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

> **Note**
>
> If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

C.5.2.19. Table-Corruption Issues

If you have started `mysqld` with `--myisam-recover-options`, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file `'Warning: Checking table ...'` which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further.

As of MySQL 5.5.3, when the server detects `MyISAM` table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: `Got an error from thread_id=1, mi_dynrec.c:368`. This is useful information to include in bug reports.

See also Section 5.1.2, “Server Command Options”, and Section 22.5.1.7, “Making a Test Case If You Experience Table Corruption”.

C.5.3. Installation-Related Issues

C.5.3.1. Problems with File Permissions

If you have problems with file permissions, the UMASK environment variable might be set incorrectly when mysqld starts. For example, MySQL might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/filename.frm' (Errcode: 13)
```

The default UMASK value is 0660. You can change this behavior by starting mysqld_safe as follows:

```
shell> UMASK=384  # = 600 in octal
shell> export UMASK
shell> mysqld_safe &
```

By default, MySQL creates database directories with an access permission value of 0700. You can modify this behavior by setting the UMASK_DIR variable. If you set its value, new directories are created with the combined UMASK and UMASK_DIR values. For example, if you want to give group access to all new directories, you can do this:

```
shell> UMASK_DIR=504  # = 770 in octal
shell> export UMASK_DIR
shell> mysqld_safe &
```

MySQL assumes that the value for UMASK or UMASK_DIR is in octal if it starts with a zero.

See Section 2.12, “Environment Variables”.

C.5.4. Administration-Related Issues

C.5.4.1. How to Reset the Root Password

If you have never set a root password for MySQL, the server does not require a password at all for connecting as root. However, this is insecure. For instructions on assigning passwords, see Section 2.10.2, “Securing the Initial MySQL Accounts”.

If you know the root password, but want to change it, see Section 12.7.1.6, “SET PASSWORD Syntax”.

If you set a root password previously, but have forgotten it, you can set a new password. The following sections provide instructions for Windows and Unix systems, as well as generic instructions that apply to any system.

C.5.4.1.1. Resetting the Root Password: Windows Systems

On Windows, use the following procedure to reset the password for all MySQL root accounts:

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager: From the START menu, select Control Panel, then Administrative Tools, then Services. Find the MySQL service in the list and stop it.

   If your server is not running as a service, you may need to use the Task Manager to force it to stop.
3. Create a text file containing the following statements. Replace the password with the password that you want to use.

   ```
   UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
   FLUSH PRIVILEGES;
   ```

   Write the UPDATE and FLUSH statements each on a single line. The UPDATE statement resets the password for all root accounts, and the FLUSH statement tells the server to reload the grant tables into memory so that it notices the password change.
4. Save the file. For this example, the file will be named C:\mysql-init.txt.
5. Open a console window to get to the command prompt: From the START menu, select Run, then enter cmd as the command to be run.
6. Start the MySQL server with the special --init-file option (notice that the backslash in the option value is doubled):

   ```
   C:\> C:\mysql\bin\mysqld --init-file=C:\\mysql-init.txt
   ```

   If you installed MySQL to a location other than C:\mysql, adjust the command accordingly.

   The server executes the contents of the file named by the --init-file option at startup, changing each root account password.

You can also add the `--console` option to the command if you want server output to appear in the console window rather than in a log file.

If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.5\bin\mysqld.exe"
        --defaults-file="C:\\Program Files\\MySQL\\MySQL Server 5.5\\my.ini"
        --init-file=C:\\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager: From the START menu, select Control Panel, then Administrative Tools, then Services. Find the MySQL service in the list, right-click it, and choose the `Properties` option. The `Path to executable` field contains the `--defaults-file` setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the MySQL server, then restart it in normal mode again. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

C.5.4.1.2. Resetting the Root Password: Unix Systems

On Unix, use the following procedure to reset the password for all MySQL `root` accounts. The instructions assume that you will start the server so that it runs using the Unix login account that you normally use for running the server. For example, if you run the server using the `mysql` login account, you should log in as `mysql` before using the instructions. Alternatively, you can log in as `root`, but in this case you *must* start `mysqld` with the `--user=mysql` option. If you start the server as `root` without using `--user=mysql`, the server may create `root`-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you will need to either change the ownership of the files to `mysql` or remove them.

1. Log on to your system as the Unix user that the `mysqld` server runs as (for example, `mysql`).

2. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the file name has an extension of `.pid` and begins with either `mysqld` or your system's host name.

   You can stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process, using the path name of the `.pid` file in the following command:

   ```
   shell> kill `cat /mysql-data-directory/host_name.pid`
   ```

   Use backticks (not forward quotation marks) with the `cat` command. These cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file containing the following statements. Replace the password with the password that you want to use.

   ```
   UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
   FLUSH PRIVILEGES;
   ```

   Write the `UPDATE` and `FLUSH` statements each on a single line. The `UPDATE` statement resets the password for all `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory so that it notices the password change.

4. Save the file. For this example, the file will be named `/home/me/mysql-init`. The file contains the password, so it should not be saved where it can be read by other users. If you are not logged in as `mysql` (the user the server runs as), make sure that the file has permissions that permit `mysql` to read it.

5. Start the MySQL server with the special `--init-file` option:

   ```
   shell> mysqld_safe --init-file=/home/me/mysql-init &
   ```

   The server executes the contents of the file named by the `--init-file` option at startup, changing each `root` account password.

6. After the server has started successfully, delete `/home/me/mysql-init`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally.

C.5.4.1.3. Resetting the Root Password: Generic Instructions

The preceding sections provide password-resetting instructions for Windows and Unix systems. Alternatively, on any platform, you can set the new password using the `mysql` client (but this approach is less secure):

1. Stop `mysqld` and restart it with the `--skip-grant-tables` option. This enables anyone to connect without a password and with all privileges. Because this is insecure, you might want to use `--skip-grant-tables` in conjunction with `--skip-networking` to prevent remote clients from connecting.

2. Connect to the `mysqld` server with this command:

   ```
   shell> mysql
   ```

3. Issue the following statements in the `mysql` client. Replace the password with the password that you want to use.

   ```
   mysql> UPDATE mysql.user SET Password=PASSWORD('MyNewPass')
       ->                   WHERE User='root';
   mysql> FLUSH PRIVILEGES;
   ```

   The `FLUSH` statement tells the server to reload the grant tables into memory so that it notices the password change.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server, then restart it normally (without the `--skip-grant-tables` and `--skip-networking` options).

C.5.4.2. What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This does not mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See Section 5.2.2, “The Error Log”.

On some systems, you can find in the error log a stack trace of where `mysqld` died that you can resolve with the `resolve_stack_dump` program. See MySQL Internals: Porting. Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with `--delay-key-write`, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that does not support good file system locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Please try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all `MyISAM` tables, and restart `mysqld`. This ensures that you are running from a clean state. See

Chapter 5, *MySQL Server Administration*.

- Start `mysqld` with the general query log enabled (see Section 5.2.3, "The General Query Log"). Then try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See Section 5.2.3, "The General Query Log". If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have been able to locate the bug and should submit a bug report for it. See Section 1.7, "How to Report Bugs or Problems".

- Try to make a test case that we can use to repeat the problem. See MySQL Internals: Porting.

- Try running the tests in the `mysql-test` directory and the MySQL benchmarks. See Section 22.1.2, "The MySQL Test Suite". They should test MySQL rather well. You can also add code to the benchmarks that simulates your application. The benchmarks can be found in the `sql-bench` directory in a source distribution or, for a binary distribution, in the `sql-bench` directory under your MySQL installation directory.

- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)

- If you configure MySQL for debugging, it is much easier to gather information about possible errors if something goes wrong. Reconfigure MySQL with the `-DWITH_DEBUG=1` option to `CMake` and then recompile. See MySQL Internals: Porting.

- Make sure that you have applied the latest patches for your operating system.

- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)

- Have you tried `mysqladmin -u root processlist` when `mysqld` appears to be running but not responding? Sometimes `mysqld` is not comatose even though you might think so. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.

- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while you run your other queries.

- Try the following:

  1. Start `mysqld` from `gdb` (or another debugger). See MySQL Internals: Porting.

  2. Run your test scripts.

  3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

     ```
     backtrace
     info local
     up
     info local
     up
     info local
     ```

     With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where `N` is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to crash or misbehave.

- Send a normal bug report. See Section 1.7, "How to Report Bugs or Problems". Be even more detailed than usual. Because MySQL works for many people, it may be that the crash results from something that exists only on your computer (for example, an error that is related to your particular system libraries).

- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

  The current dynamic row code has been in use for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Do not rule out your server hardware when diagnosing problems. Defective hardware can be the cause of data corruption. Particular attention should be paid to your memory and disk subsystems when troubleshooting hardware.

C.5.4.3. How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, you can take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- To abort the thread, you must use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition enables the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA INFILE` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

C.5.4.4. Where MySQL Stores Temporary Files

On Unix, MySQL uses the value of the `TMPDIR` environment variable as the path name of the directory in which to store temporary files. If `TMPDIR` is not set, MySQL uses the system default, which is usually `/tmp`, `/var/tmp`, or `/usr/tmp`.

On Windows, MySQL checks in order the values of the `TMPDIR`, `TEMP`, and `TMP` environment variables. For the first one found to be set, MySQL uses it and does not check those remaining. If none of `TMPDIR`, `TEMP`, or `TMP` are set, MySQL uses the Windows system default, which is usually `C:\windows\temp\`.

If the file system containing your temporary file directory is too small, you can use the `--tmpdir` option to `mysqld` to specify a directory in a file system where you have enough space.

In MySQL 5.5, the `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (“`:`”) on Unix and semicolon characters (“`;`”) on Windows.

> **Note**
>
> To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you should not set `--tmpdir` to point to a directory on a memory-based file system or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or `LOAD DATA INFILE` operations. If files in the temporary file directory are lost when the server restarts, replication fails.

MySQL creates all temporary files as hidden files. This ensures that the temporary files are removed if `mysqld` is terminated. The disadvantage of using hidden files is that you do not see a big temporary file that fills up the file system in which the temporary file directory is located.

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some SELECT queries, MySQL also creates temporary SQL tables. These are not hidden and have names of the form SQL_*.

ALTER TABLE creates a temporary table in the same directory as the original table.

C.5.4.5. How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is /tmp/mysql.sock. (For some distribution formats, the directory might be different, such as /var/lib/mysql for RPMs.)

On some versions of Unix, anyone can delete files in the /tmp directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your /tmp directory so that files can be deleted only by their owners or the superuser (root). To do this, set the sticky bit on the /tmp directory by logging in as root and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the sticky bit is set by executing ls -ld /tmp. If the last permission character is t, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in /etc/my.cnf:

  ```
  [mysqld]
  socket=/path/to/socket

  [client]
  socket=/path/to/socket
  ```

  See Section 4.2.3.3, “Using Option Files”.

- Specify a --socket option on the command line to mysqld_safe and when you run client programs.
- Set the MYSQL_UNIX_PORT environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the MYSQL_UNIX_ADDR option when you run CMake. See Section 2.9.4, “MySQL Source-Configuration Options”.

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

C.5.4.6. Time Zone Problems

If you have a problem with SELECT NOW() returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if UNIX_TIMESTAMP() returns the wrong value. This should be done for the environment in which the server runs; for example, in mysqld_safe or mysql.server. See Section 2.12, “Environment Variables”.

You can set the time zone for the server with the --timezone=*timezone_name* option to mysqld_safe. You can also set it by setting the TZ environment variable before you start mysqld.

The permissible values for --timezone or TZ are system dependent. Consult your operating system documentation to see what values are acceptable.

C.5.5. Query-Related Issues

C.5.5.1. Case Sensitivity in String Searches

For nonbinary strings (CHAR, VARCHAR, TEXT), string searches use the collation of the comparison operands. For binary strings (BINARY, VARBINARY, BLOB), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons will be case sensitive.

A comparison between a nonbinary string and binary string is treated as a comparison of binary strings.

Simple comparison operations (>=, >, =, <, <=, sorting, and grouping) are based on each character's “sort value.” Characters with the same sort value are treated as the same character. For example, if “e” and “é” have the same sort value in a given collation, they compare as equal.

The default character set and collation are `latin1` and `latin1_swedish_ci`, so nonbinary string comparisons are case insensitive by default. This means that if you search with *`col_name`* `LIKE 'a%'`, you get all column values that start with `A` or `a`. To make this search case sensitive, make sure that one of the operands has a case sensitive or binary collation. For example, if you are comparing a column and a string that both have the `latin1` character set, you can use the `COLLATE` operator to cause either operand to have the `latin1_general_cs` or `latin1_bin` collation:

```
col_name COLLATE latin1_general_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_general_cs
col_name COLLATE latin1_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case sensitive or binary collation. See Section 12.1.17, “CREATE TABLE Syntax”.

To cause a case-sensitive comparison of nonbinary strings to be case insensitive, use `COLLATE` to name a case-insensitive collation. The strings in the following example normally are case sensitive, but `COLLATE` changes the comparison to be case insensitive:

```
mysql> SET @s1 = 'MySQL' COLLATE latin1_bin,
    ->     @s2 = 'mysql' COLLATE latin1_bin;
mysql> SELECT @s1 = @s2;
+-----------+
| @s1 = @s2 |
+-----------+
|         0 |
+-----------+
mysql> SELECT @s1 COLLATE latin1_swedish_ci = @s2;
+-------------------------------------+
| @s1 COLLATE latin1_swedish_ci = @s2 |
+-------------------------------------+
|                                   1 |
+-------------------------------------+
```

A binary string is case sensitive in comparisons. To compare the string as case insensitive, convert it to a nonbinary string and use `COLLATE` to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
+--------------+
| @s = 'mysql' |
+--------------+
|            0 |
+--------------+
mysql> SELECT CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql';
+-------------------------------------------------------------------+
| CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql' |
+-------------------------------------------------------------------+
|                                                                 1 |
+-------------------------------------------------------------------+
```

To determine whether a value will compare as a nonbinary or binary string, use the `COLLATION()` function. This example shows that `VERSION()` returns a string that has a case-insensitive collation, so comparisons are case insensitive:

```
mysql> SELECT COLLATION(VERSION());
+----------------------+
| COLLATION(VERSION()) |
+----------------------+
| utf8_general_ci      |
+----------------------+
```

For binary strings, the collation value is `binary`, so comparisons will be case sensitive. One context in which you will see `binary` is for compression and encryption functions, which return binary strings as a general rule: string:

```
mysql> SELECT COLLATION(ENCRYPT('x')), COLLATION(SHA1('x'));
+-------------------------+----------------------+
| COLLATION(ENCRYPT('x')) | COLLATION(SHA1('x')) |
+-------------------------+----------------------+
| binary                  | binary               |
+-------------------------+----------------------+
```

C.5.5.2. Problems Using `DATE` Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is permitted. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
SELECT * FROM t1 WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context and vice versa.

MySQL also permits a “relaxed” string format when updating and in a `WHERE` clause that compares a date to a `DATE`, `DATETIME`, or `TIMESTAMP` column. “Relaxed” format means that any punctuation character may be used as the separator between parts. For example, `'2004-08-15'` and `'2004#08#15'` are equivalent. MySQL can also convert a string containing no separators (such as `'20040815'`), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any comparison method other than those just listed, such as `IN` or `STRCMP()`.

For those exceptions, the comparison is done by converting the objects to strings and performing a string comparison.

To be on the safe side, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special “zero” date `'0000-00-00'` can be stored and retrieved as `'0000-00-00'`. When a `'0000-00-00'` date is used through Connector/ODBC, it is automatically converted to `NULL` because ODBC cannot handle that kind of date.

Because MySQL performs the conversions just described, the following statements work (assume that `idate` is a `DATE` column):

```
INSERT INTO t1 (idate) VALUES (19970505);
INSERT INTO t1 (idate) VALUES ('19970505');
INSERT INTO t1 (idate) VALUES ('97-05-05');
INSERT INTO t1 (idate) VALUES ('1997.05.05');
INSERT INTO t1 (idate) VALUES ('1997 05 05');
INSERT INTO t1 (idate) VALUES ('0000-00-00');

SELECT idate FROM t1 WHERE idate >= '1997-05-05';
SELECT idate FROM t1 WHERE idate >= 19970505;
SELECT MOD(idate,100) FROM t1 WHERE idate >= 19970505;
SELECT idate FROM t1 WHERE idate >= '19970505';
```

However, the following statement does not work:

```
SELECT idate FROM t1 WHERE STRCMP(idate,'20030505')=0;
```

`STRCMP()` is a string function, so it converts `idate` to a string in `'YYYY-MM-DD'` format and performs a string comparison. It does not convert `'20030505'` to the date `'2003-05-05'` and perform a date comparison.

If you enable the `ALLOW_INVALID_DATES` SQL mode, MySQL permits you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12. This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

MySQL permits you to store dates where the day or month and day are zero. This is convenient if you want to store a birthdate in a `DATE` column and you know only part of the date. To disallow zero month or day parts in dates, enable the `NO_ZERO_IN_DATE` SQL mode.

MySQL permits you to store a “zero” value of `'0000-00-00'` as a “dummy date.” This is in some cases more convenient than using `NULL` values. If a date to be stored in a `DATE` column cannot be converted to any reasonable value, MySQL stores `'0000-00-00'`. To disallow `'0000-00-00'`, enable the `NO_ZERO_DATE` SQL mode.

To have MySQL check all dates and accept only legal dates (unless overridden by `IGNORE`), set the `sql_mode` system variable to `"NO_ZERO_IN_DATE,NO_ZERO_DATE"`.

C.5.5.3. Problems with `NULL` Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string `''`. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the

person is known to have no phone, and thus no phone number.”

To help with NULL handling, you can use the IS NULL and IS NOT NULL operators and the IFNULL() function.

In SQL, the NULL value is never true in comparison to any other value, even NULL. An expression that contains NULL always produces a NULL value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return NULL:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

To search for column values that are NULL, you cannot use an expr = NULL test. The following statement returns no rows, because expr = NULL is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for NULL values, you must use the IS NULL test. The following statements show how to find the NULL phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See Section 3.3.4.6, “Working with NULL Values”, for additional information and examples.

You can add an index on a column that can have NULL values if you are using the MyISAM, InnoDB, or MEMORY storage engine. Otherwise, you must declare an indexed column NOT NULL, and you cannot insert NULL into the column.

When reading data with LOAD DATA INFILE, empty or missing columns are updated with ''. To load a NULL value into a column, use \N in the data file. The literal word “NULL” may also be used under some circumstances. See Section 12.2.6, “LOAD DATA INFILE Syntax”.

When using DISTINCT, GROUP BY, or ORDER BY, all NULL values are regarded as equal.

When using ORDER BY, NULL values are presented first, or last if you specify DESC to sort in descending order.

Aggregate (summary) functions such as COUNT(), MIN(), and SUM() ignore NULL values. The exception to this is COUNT(*), which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-NULL values in the age column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles NULL values specially. If you insert NULL into a TIMESTAMP column, the current date and time is inserted. If you insert NULL into an integer or floating-point column that has the AUTO_INCREMENT attribute, the next number in the sequence is inserted.

C.5.5.4. Problems with Column Aliases

An alias can be used in a query select list to give a column a different name. You can use the alias in GROUP BY, ORDER BY, or HAVING clauses to refer to the column:

```
SELECT SQRT(a*b) AS root FROM tbl_name
  GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name
  GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL disallows references to column aliases in a WHERE clause. This restriction is imposed because when the WHERE clause is evaluated, the column value may not yet have been determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name
  WHERE cnt > 0 GROUP BY id;
```

The WHERE clause determines which rows should be included in the GROUP BY clause, but it refers to the alias of a column value that is not known until after the rows have been selected, and grouped by the GROUP BY.

In the select list of a query, a quoted column alias can be specified using identifier or string quoting characters:

```
SELECT 1 AS `one`, 2 AS 'two';
```

Elsewhere in the statement, quoted references to the alias must use identifier quoting or the reference is treated as a string literal. For example, this statement groups by the values in column id, referenced using the alias `a`:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
  GROUP BY `a`;
```

But this statement groups by the literal string `'a'` and will not work as expected:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
  GROUP BY 'a';
```

C.5.5.5. Rollback Failure for Nontransactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These nontransactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and nontransactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` does not support a storage engine, it instead creates the table as a `MyISAM` table, which is nontransactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See Section 12.7.5.37, “`SHOW TABLE STATUS` Syntax”, and Section 12.7.5.12, “`SHOW CREATE TABLE` Syntax”.

You can check which storage engines your `mysqld` server supports by using this statement:

```
SHOW ENGINES;
```

You can also use the following statement, and check the value of the variable that is associated with the storage engine in which you are interested:

```
SHOW VARIABLES LIKE 'have_%';
```

For example, to determine whether the `InnoDB` storage engine is available, check the value of the `have_innodb` variable.

See Section 12.7.5.17, “`SHOW ENGINES` Syntax”, and Section 12.7.5.40, “`SHOW VARIABLES` Syntax”.

C.5.5.6. Deleting Rows from Related Tables

If the total length of the `DELETE` statement for `related_table` is more than 1MB (the default value of the `max_allowed_packet` system variable), you should split it into smaller parts and execute multiple `DELETE` statements. You probably get the fastest `DELETE` by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` isn't indexed, the speed is independent of the number of arguments in the `IN` clause.

C.5.5.7. Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that returns no rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See Section 12.8.2, “`EXPLAIN` Syntax”.
2. Select only those columns that are used in the `WHERE` clause.
3. Remove one table at a time from the query until it returns some rows. If the tables are large, it is a good idea to use `LIMIT 10` with the query.
4. Issue a `SELECT` for the column that should have matched a row against the table that was last removed from the query.
5. If you are comparing `FLOAT` or `DOUBLE` columns with numbers that have decimals, you cannot use equality (`=`) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision.

In some cases, changing the `FLOAT` to a `DOUBLE` fixes this. See Section C.5.5.8, "Problems with Floating-Point Values".

6. If you still cannot figure out what is wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

   Verify that the test file demonstrates the problem by executing these commands:

   ```
   shell> mysqladmin create test2
   shell> mysql test2 < query.sql
   ```

   Attach the test file to a bug report, which you can file using the instructions in Section 1.7, "How to Report Bugs or Problems".

C.5.5.8. Problems with Floating-Point Values

Floating-point numbers sometimes cause confusion because they are approximate and not stored as exact values. A floating-point value as written in an SQL statement may not be the same as the value represented internally. Attempts to treat floating-point values as exact in comparisons may lead to problems. They are also subject to platform or implementation dependencies. The `FLOAT` and `DOUBLE` data types are subject to these issues. For `DECIMAL` columns, MySQL performs operations with a precision of 65 decimal digits, which should solve most common inaccuracy problems.

The following example uses `DOUBLE` to demonstrate how calculations that are done using floating-point operations are subject to floating-point error.

```
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
    -> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
    -> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
    -> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
    -> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
    -> (6, 0.00, 0.00), (6, -51.40, 0.00);

mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
    -> FROM t1 GROUP BY i HAVING a <> b;

+------+-------+------+
| i    | a     | b    |
+------+-------+------+
|    1 |  21.4 | 21.4 |
|    2 |  76.8 | 76.8 |
|    3 |   7.4 |  7.4 |
|    4 |  15.4 | 15.4 |
|    5 |   7.2 |  7.2 |
|    6 | -51.4 |    0 |
+------+-------+------+
```

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns `d1` and `d2` had been defined as `DECIMAL` rather than `DOUBLE`, the result of the `SELECT` query would have contained only one row—the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
    -> GROUP BY i HAVING ABS(a - b) > 0.0001;
+------+-------+------+
| i    | a     | b    |
+------+-------+------+
|    6 | -51.4 |    0 |
+------+-------+------+
1 row in set (0.00 sec)
```

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
    -> GROUP BY i HAVING ABS(a - b) <= 0.0001;
+------+------+------+
| i    | a    | b    |
+------+------+------+
```

```
|    1 | 21.4 | 21.4 |
|    2 | 76.8 | 76.8 |
|    3 |  7.4 |  7.4 |
|    4 | 15.4 | 15.4 |
|    5 |  7.2 |  7.2 |
+------+------+------+
5 rows in set (0.03 sec)
```

Floating-point values are subject to platform or implementation dependencies. Suppose that you execute the following statements:

```
CREATE TABLE t1(c1 FLOAT(53,0), c2 FLOAT(53,0));
INSERT INTO t1 VALUES('1e+52','-1e+52');
SELECT * FROM t1;
```

On some platforms, the `SELECT` statement returns `inf` and `-inf`. Other others, it returns `0` and `-0`.

An implication of the preceding issues is that if you attempt to create a replication slave by dumping table contents with `mysqldump` on the master and reloading the dump file into the slave, tables containing floating-point columns might differ between the two hosts.

C.5.6. Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL does not have enough information about the data at hand and has to make “educated” guesses about the data.

For the cases when MySQL does not do the "right" thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

  ```
  mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
  ```

  `EXPLAIN` is discussed in more detail in Section 12.8.2, “`EXPLAIN` Syntax”.

- Use `ANALYZE TABLE` *`tbl_name`* to update the key distributions for the scanned table. See Section 12.7.2.1, “`ANALYZE TABLE` Syntax”.

- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

  ```
  SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
  WHERE t1.col_name=t2.col_name;
  ```

  `USE INDEX` and `IGNORE INDEX` may also be useful. See Section 12.2.9.3, “Index Hint Syntax”.

- Global and table-level `STRAIGHT_JOIN`. See Section 12.2.9, “`SELECT` Syntax”.

- You can tune global or thread-specific system variables. For example, start `mysqld` with the `--max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See Section 5.1.3, “Server System Variables”.

C.5.7. Table Definition-Related Issues

C.5.7.1. Problems with `ALTER TABLE`

If you get a duplicate-key error when using `ALTER TABLE` to change the character set or collation of a character column, the cause is either that the new column collation maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table.

If `ALTER TABLE` dies with the following error, the problem may be that MySQL crashed during an earlier `ALTER TABLE` operation and there is an old table named `A-`*`xxx`* or `B-`*`xxx`* lying around:

```
Error on rename of './database/name.frm'
to './database/B-xxx.frm' (Errcode: 17)
```

In this case, go to the MySQL data directory and delete all files that have names starting with `A-` or `B-`. (You may want to move them elsewhere instead of deleting them.)

`ALTER TABLE` works in the following way:

- Create a new table named `A-xxx` with the requested structural changes.
- Copy all rows from the original table to `A-xxx`.
- Rename the original table to `B-xxx`.
- Rename `A-xxx` to your original table name.
- Delete `B-xxx`.

If something goes wrong with the renaming operation, MySQL tries to undo the changes. If something goes seriously wrong (although this shouldn't happen), MySQL may leave the old table as `B-xxx`. A simple rename of the table files at the system level should get your data back.

If you use `ALTER TABLE` on a transactional table or if you are using Windows, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

C.5.7.2. `TEMPORARY` Table Problems

The following list indicates limitations on the use of `TEMPORARY` tables:

- A `TEMPORARY` table can only be of type `MEMORY`, `MyISAM`, `MERGE`, or `InnoDB`.

  Temporary tables are not supported for MySQL Cluster.

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

  This error also occurs if you refer to a temporary table multiple times in a stored function under different aliases, even if the references occur in different statements within the function.

- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- You cannot use `RENAME` to rename a `TEMPORARY` table. However, you can use `ALTER TABLE` instead:

```
mysql> ALTER TABLE orig_name RENAME new_name;
```

- There are known issues in using temporary tables with replication. See Section 15.4.1, “Replication Features and Issues”, for more information.

C.5.8. Known Issues in MySQL

This section lists known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in Section 2.1, “General Installation Guidance”, and MySQL Internals: Porting.

The following problems are known:

- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).
- Dropping a `FOREIGN KEY` constraint does not work in replication because the constraint may have another name on the slave.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` does not work inside `GROUP_CONCAT()` if you do not use all and only those columns that are in the `DISTINCT` list.

- If one user has a long-running transaction and another user drops a table that is updated in the transaction, there is small chance that the binary log may contain the `DROP TABLE` statement before the table is used in the transaction itself.
- When inserting a big integer value (between 2^{63} and 2^{64}–1) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.
- `FLUSH TABLES WITH READ LOCK` does not block `COMMIT` if the server is running without binary logging, which may cause a problem (of consistency between tables) when doing a full backup.
- `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` may cause problems on tables for which you are using `INSERT DELAYED`.
- Performing `LOCK TABLE ...` and `FLUSH TABLES ...` does not guarantee that there isn't a half-finished transaction in progress on the table.
- Replication uses query-level logging: The master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases.

  It is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is nondeterministic (generally not a recommended practice, even outside of replication).

  For example:

  - `CREATE TABLE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
  - `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
  - `REPLACE ... SELECT`, `INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

  If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.

  For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the master and slave.

  A query is optimized differently on the master and slave only if:

  - The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use `InnoDB` on the master, but `MyISAM` on the slave if the slave has less available disk space.)
  - MySQL buffer sizes (`key_buffer_size`, and so on) are different on the master and slave.
  - The master and slave run different MySQL versions, and the optimizer code differs between these versions.

  This problem may also affect database restoration using `mysqlbinlog|mysql`.

  The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned nondeterministic queries to ensure that the rows are always stored or modified in the same order.
- Log file names are based on the server host name if you do not specify a file name with the startup option. To retain the same log file names if you change your host name to something else, you must explicitly use options such as `--log-bin=`*`old_host_name`*`-bin`. See Section 5.1.2, “Server Command Options”. Alternatively, rename the old files to reflect your host name change. If these are binary logs, you must edit the binary log index file and fix the binary log file names there as well. (The same is true for the relay logs on a slave server.)
- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA INFILE` statement. See Section 4.6.7, “`mysqlbinlog` — Utility for Processing Binary Log Files”.
- `RENAME` does not work with `TEMPORARY` tables or tables used in a `MERGE` table.
- When using `SET CHARACTER SET`, you cannot use translated characters in database, table, and column names.
- You cannot use “`_`” or “`%`” with `ESCAPE` in `LIKE ... ESCAPE`.
- Only the first `max_sort_length` bytes are used when comparing `BLOB` `BLOB` and `TEXT` values. This means that these values cannot reliably be used in `GROUP BY`, `ORDER BY` or `DISTINCT` if they are not distinct in the first `max_sort_length` bytes. To work around this, increase the variable value. The default value of `max_sort_length` is 1024 and can be changed at server startup time or at runtime.

- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF()` and `ELT()` with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.
- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by `2`, **not** `1`:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns do not participate in the `DISTINCT` comparison.

  An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads
       WHERE userid = 9 ORDER BY id DESC;
```

  and

```
SELECT DISTINCT band_downloads.mp3id
       FROM band_downloads,band_mp3
       WHERE band_downloads.userid = 9
       AND band_mp3.id = band_downloads.mp3id
       ORDER BY band_downloads.id DESC;
```

  In the second case, using MySQL Server 3.23.x, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

  Note that this happens only for queries that do not have the `ORDER BY` columns in the result.
- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` does not check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

Appendix D. MySQL Change History

D.8.9. Changes in MySQL Proxy 0.5.1 (30 June 2007) 3264
D.8.10. Changes in MySQL Proxy 0.5.0 (19 June 2007) 3264

This appendix lists the changes from version to version in the MySQL source code through the latest version of MySQL 5.5, which is currently MySQL 5.5.23. We offer a version of the Manual for each series of MySQL releases (5.0, 5.1, and so forth). For information about changes in another release series of the MySQL database software, see the corresponding version of this Manual.

We update this section as we add new features in the 5.5 series, so that everybody can follow the development process.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (http://dev.mysql.com/downloads/), it means that the version has not yet been released.

The date mentioned with a release version is the date of the last Bazaar ChangeSet on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

The manual included in the source and binary distributions may not be fully accurate when it comes to the release changelog entries, because the integration of the manual happens at build time. For the most up-to-date release changelog, please refer to the online version instead.

Previously, MySQL development proceeded by including a large set of features and moving them over many versions within a release series through several stages of maturity (Alpha, Beta, and so forth). This development model had a disadvantage in that problems with only part of the code could hinder timely release of the whole.

MySQL development now uses a milestone model. The move to this model provides for more frequent milestone releases, with each milestone proceeding through a small number of releases having a focus on a specific subset of thoroughly tested features. Following the releases for one milestone, development proceeds with the next milestone; that is, another small number of releases that focuses on the next small set of features, also thoroughly tested.

MySQL 5.5.0-m2 is the first release for Milestone 2. The new features of this milestone may be considered to be initially of beta quality. For subsequent Milestone 2 releases, we plan to use increasing version numbers (5.5.1 and higher) while continuing to employ the “-m2” suffix. For Milestone 3, we plan to change the suffix to “-m3”. Version designators with “-alpha” or “-beta” suffixes are no used.

You may notice that the MySQL 5.5.0 release is designated as Milestone 2 rather than Milestone 1. This is because MySQL 5.4 was actually designated as Milestone 1, although we had not yet begun referring to milestone numbers as part of version numbers at the time.

D.1. Changes in Release 5.5.x (Production)

An overview of features added in MySQL 5.5 can be found here: Section 1.4, “What Is New in MySQL 5.5”. For a full list of

changes, please refer to the changelog sections for individual 5.5 releases.

For discussion of upgrade issues that you may encounter for upgrades from MySQL 5.1 to MySQL 5.5, see Section 2.11.1.1, “Upgrading from MySQL 5.1 to 5.5”.

For discussion of upgrade issues that you may encounter for upgrades from MySQL 5.4 to MySQL 5.5, see Section 2.11.1.2, “Upgrading from MySQL 5.4 to 5.5”.

For changes relating to MySQL Cluster, see Section 16.7, “Changes in MySQL Cluster”.

D.1.1. Changes in MySQL 5.5.22 (21 March 2012)

Functionality Added or Changed

- **InnoDB Storage Engine**: A deprecation warning is now issued when `--ignore-builtin-innodb` is used. (Bug #13586262)
- yaSSL was upgraded from version 1.7.2 to 2.2.0.

Bugs Fixed

- **Important Change**: **InnoDB Storage Engine**: When a row grew in size due to an `UPDATE` operation, other (non-updated) columns could be moved to off-page storage so that information about the row still fit within the constraints of the `InnoDB` page size. The pointer to the new allocated off-page data was not set up until the pages were allocated and written, potentially leading to lost data if the system crashed while the column was being moved out of the page. The problem was more common with tables using `ROW_FORMAT=DYNAMIC` or `ROW_FORMAT=COMPRESSED` along with the Barracuda file format, particularly with the `innodb_file_per_table` setting enabled, because page allocation operations are more common as the `.ibd` tablespace files are extended. Still, the problem could occur with any combination of InnoDB version, file format, and row format.

  A related issue was that during such an `UPDATE` operation, or an `INSERT` operation that reused a delete-marked record, other transactions could see invalid data for the affected column, regardless of isolation level.

  The fix corrects the order of operations for moving the column data off the original page and replacing it with a pointer. Now if a crash occurs at the precise moment when the column data is being transferred, the transfer will not be re-run during crash recovery.

  In MySQL 5.1, this fix applies to the InnoDB Plugin, but not the built-in InnoDB storage engine. (Bug #13721257, Bug #12612184, Bug #12704861)

- **InnoDB Storage Engine**: An erroneous assertion could occur, in debug builds only, when creating an index on a column containing zero-length values (that is, `''`). (Bug #13654923)

- **InnoDB Storage Engine**: A DDL operation such as `ALTER TABLE ... ADD COLUMN` could stall, eventually timing out with an `Error 1005: Can't create table` message referring to `fil_rename_tablespace`. (Bug #13636122, Bug #62100, Bug #63553)

- **InnoDB Storage Engine**: A DDL operation for an `InnoDB` table could cause a busy MySQL server to halt with an assertion error:

  ```
  InnoDB: Failing assertion: trx->error_state == DB_SUCCESS
  ```

  The error occurred if the DDL operation was run while all 1023 undo slots were in use by concurrent transactions. This error was less likely to occur in MySQL 5.5 and 5.6, because raising the number of `InnoDB` undo slots increased the number of simultaneous transactions (corresponding to the number of undo slots) from 1K to 128K. (Bug #12739098, Bug #62401)

- **InnoDB Storage Engine**: Server startup could produce an error for temporary tables using the `InnoDB` storage engine, if the path in the `$TMPDIR` variable ended with a `/` character. The error log would look like:

  ```
  120202 19:21:26  InnoDB: Operating system error number 2 in a file operation.
  InnoDB: The error means the system cannot find the path specified.
  InnoDB: If you are installing InnoDB, remember that you must create
  InnoDB: directories yourself, InnoDB does not create them.
  120202 19:21:26  InnoDB: Error: trying to open a table, but could not
  InnoDB: open the tablespace file './t/#sql7750_1_0.ibd'!
  InnoDB: Have you moved InnoDB .ibd files around without using the
  InnoDB: commands DISCARD TABLESPACE and IMPORT TABLESPACE?
  InnoDB: It is also possible that this is a temporary table #sql...,
  InnoDB: and MySQL removed the .ibd file for this.
  ```

The workaround for the problem was to create a similar temporary table again, copy its `.frm` file to `tmpdir` under the name mentioned in the error message (for example, `#sql123.frm`) and restart `mysqld` with `tmpdir` set to its normal value without a trailing slash, for example `/var/tmp`. On startup, MySQL would see the `.frm` file and issue `DROP TABLE` for the orphaned temporary table. (Bug #11754376, Bug #45976)

- **Replication**: Statements that wrote to tables with `AUTO_INCREMENT` columns based on an unordered `SELECT` from another table could lead to the master and the slave going out of sync, as the order in which the rows are retrieved from the table may differ between them. Such statements include any `INSERT ... SELECT`, `REPLACE ... SELECT`, or `CREATE TABLE ... SELECT` statement. Such statements are now marked as unsafe for statement-based replication, which causes the execution of one to throw a warning, and forces the statement to be logged using the row-based format if the logging format is `MIXED`. (Bug #11758263, Bug #50440)

- The contents of the `shared` and `shared-compat` RPM packages had been changed in versions 5.5.6 and 5.6.1 to avoid the overlap which they traditionally had (and still have in MySQL 5.0 and 5.1). However, the RPM meta information had not been changed in accordance, and so RPM still assumed a conflict between `shared` and `shared-compat` RPM packages. This has been fixed. (Bug #60855, Bug #12368215)

  References: See also Bug #56150.

- `myisam_sort_buffer_size` could not be set larger than 4GB on 64-bit systems. (Bug #45702, Bug #11754145)

- Due to improper locking, concurrent inserts into an `ARCHIVE` table at the same time as repair and check operations on the table resulted in table corruption. (Bug #37280, Bug #11748748)

D.1.2. Changes in MySQL 5.5.21 (17 February 2012)

Functionality Added or Changed

- A new `CMake` option, `MYSQL_PROJECT_NAME`, can be set on Windows or Mac OS X to be used in the project name. (Bug #13551687)

Bugs Fixed

- **Performance**: **InnoDB Storage Engine**: Memory allocation for `InnoDB` tables was reorganized to reduce the memory overhead for large numbers of tables or partitions, avoiding situations where the “resident set size” could grow regardless of `FLUSH TABLES` statements. The problem was most evident for tables with large row size. Some of the memory that was formerly allocated for every open table is now allocated only when the table is modified for the first time. (Bug #11764622, Bug #57480)

- **Incompatible Change**: An earlier change (in MySQL 5.1.59 and 5.5.16) was found to modify date-handling behavior in General Availability-status series (MySQL 5.1 and 5.5). This change has been reverted.

  The change was that several functions became more strict when passed a `DATE()` function value as their argument, thus they rejected incomplete dates with a day part of zero. These functions were affected: `CONVERT_TZ()`, `DATE_ADD()`, `DATE_SUB()`, `DAYOFYEAR()`, `LAST_DAY()`, `TIMESTAMPDIFF()`, `TO_DAYS()`, `TO_SECONDS()`, `WEEK()`, `WEEKDAY()`, `WEEKOFYEAR()`, `YEARWEEK()`. The previous behavior has been restored. (Bug #13458237)

- **InnoDB Storage Engine**: A Valgrind error was fixed in the function `os_aio_init()`. (Bug #13612811)

- **InnoDB Storage Engine**: The server could crash when creating an `InnoDB` temporary table under Linux, if the `$TMPDIR` setting points to a `tmpfs` filesystem and `innodb_use_native_aio` is enabled, as it is by default in MySQL 5.5.4 and higher. The entry in the error log looked like:

```
101123  2:10:59  InnoDB: Operating system error number 22 in a file operation.
InnoDB: Error number 22 means 'Invalid argument'.
```

  The crash occurred because asynchronous I/O is not supported on tmpfs in some Linux kernel versions. The workaround was to turn off the `innodb_use_native_aio` setting or use a different temporary directory. The fix causes `InnoDB` to turn off the `innodb_use_native_aio` setting automatically if it detects that the temporary file directory does not support asynchronous I/O. (Bug #13593888, Bug #11765450, Bug #58421)

- **InnoDB Storage Engine**: References to C preprocessor symbols and macros `HAVE_purify`, `UNIV_INIT_MEM_TO_ZERO`, and `UNIV_SET_MEM_TO_ZERO` were removed from the `InnoDB` source code. They were only used in debug builds instrumented for Valgrind. They are replaced by calls to the `UNIV_MEM_INVALID()` macro. (Bug #13418934)

- **InnoDB Storage Engine**: The MySQL server could halt with an assertion error:

```
InnoDB: Failing assertion: page_get_n_recs(page) > 1
```

Subsequent restarts could fail with the same error. The error occurred during a purge operation involving the `InnoDB` change buffer. The workaround was to set the configuration option `innodb_change_buffering=inserts`. (Bug #13413535, Bug #61104)

- **InnoDB Storage Engine**: With 1024 concurrent `InnoDB` transactions running concurrently and the `innodb_file_per_table` setting enabled, a `CREATE TABLE` operation for an `InnoDB` table could fail. The `.ibd` file from the failed `CREATE TABLE` was left behind, preventing the table from being created later, after the load had dropped.

  The fix adds error handling to delete the erroneous `.ibd` file. This error was less likely to occur in MySQL 5.5 and 5.6, because raising the number of `InnoDB` undo slots increased the number of simultaneous transactions needed to trigger the bug, from 1K to 128K. (Bug #12400341)

- **Replication**: Executing `mysqlbinlog` with the `--start-position=N` option, where *N* was equal either to 0 or to a value greater than the length of the dump file, caused it to crash.

  This issue was introduced in MySQL 5.5.18 by the fix for Bug #32228 and Bug #11747416. (Bug #13593869, Bug #64035)

- **Replication**: On Windows replication slave hosts, `STOP SLAVE` took an excessive length of time to complete when the master was down. (Bug #11752315, Bug #43460)

- The shared version of `libmysqlclient` did not export these functions for linking by client programs: `get_tty_password()`, `handle_options()`, `my_print_help()`. (Bug #13604121)

- A query that used an index on a `CHAR` column referenced in a `BETWEEN` clause could return invalid results. (Bug #13463488, Bug #63437)

- Expressions that compared a `BIGINT` column with any non-integer constant were performed using integers rather than decimal or float values, with the result that the constant could be truncated. This could lead to any such comparison that used `<`, `>`, `<=`, `>=`, `=`, `!=`/`<>`, `IN`, or `BETWEEN` yielding false positive or negative results. (Bug #13463415, Bug #11758543, Bug #63502, Bug #50756)

- When the optimizer performed conversion of `DECIMAL` values while evaluating range conditions, it could produce incorrect results. (Bug #13453382)

- When running `mysqldump` with both the `--single-transaction` and `--flush-logs` options, the flushing of the log performed an implicit `COMMIT` (see Section 12.3.3, “Statements That Cause an Implicit Commit”), causing more than one transaction to be used and thus breaking consistency. (Bug #12809202, Bug #61854)

- When used with the `--xml` option, `mysqldump --routines` failed to dump any stored routines, triggers, or events. (Bug #11760384, Bug #52792)

- It was possible in the event of successive failures for `mysqld_safe` to restart quickly enough to consume excessive amounts of CPU. Now, on systems that support the `sleep` and `date` system utilities, `mysqld_safe` checks to see whether it has restarted more than 5 times in the current second, and if so, waits 1 second before attempting another restart. (Bug #11761530, Bug #54035)

- It was possible on replication slaves where `FEDERATED` tables were in use to get timeouts on long-running operations, such as Error 1160 `GOT AN ERROR WRITING COMMUNICATION PACKETS`. The `FEDERATED` tables did not need to be replicated for the issue to occur. (Bug #11758931, Bug #51196)

  References: See also Bug #12896628, Bug #61790.

- If an attempt to initiate a statement failed, the issue could not be reported to the client because it was not prepared to receive any error messages prior to the execution of any statement. Since the user could not execute any queries, they were simply disconnected without providing a clear error.

  After the fix for this issue, the client is prepared for an error as soon as it attempts to initiate a statement, so that the error can be reported prior to disconnecting the user. (Bug #11755281, Bug #47032)

- On Windows, the server incorrectly constructed the full path name of the plugin binary for `INSTALL PLUGIN` and `CREATE FUNCTION ... SONAME`. (Bug #45549, Bug #11754014)

- Using `myisamchk` with the sort recover method to repair a table having fixed-width row format could cause the row pointer size to be reduced, effectively resulting in a smaller maximum data file size. (Bug #48848, Bug #11756869)

- The stored routine cache was subject to a small memory leak that over time or with many routines being used could result in out-of-memory errors. (Bug #44585, Bug #11753187)

D.1.3. Changes in MySQL 5.5.20 (10 January 2012)

Functionality Added or Changed

- A new server option, `--slow-start-timeout`, controls the Windows service control manager's service start timeout. The value is the maximum number of milliseconds that the service control manager waits before trying to kill the MySQL service during startup. The default value is 15000 (15 seconds). If the MySQL service takes too long to start, you may need to increase this value. A value of 0 means there is no timeout. (Bug #45546, Bug #11754011)

Bugs Fixed

- **Performance**: **InnoDB Storage Engine**: This fix improved the efficiency and concurrency of freeing pages in the `InnoDB` buffer pool when performing a `DROP TABLE` for an `InnoDB` table when the `innodb_file_per_table` option is enabled.

  This change is most noticeable for systems with large buffer pools. During the drop operation, one traversal of the buffer pool memory structure is changed from the LRU list (the entire buffer pool) to the flush list (a much smaller structure). The LRU scanning is reduced, but not entirely eliminated. The buffer pool mutex is also released periodically, so that if the drop operation takes significant time, other threads can proceed concurrently. (Bug #11759044, Bug #51325)

- **Important Change**: **Replication**: Setting an empty user in a `CHANGE MASTER TO` statement caused an invalid internal result and is no longer permitted. Trying to use `MASTER_USER=''` or setting `MASTER_PASSWORD` while leaving `MASTER_USER` unset causes the statement to fail with an error. (Bug #13427949)

- **Important Change**: **Replication**: Moving the binary log file, relay log file, or both files to a new location, then restarting the server with a new value for `--log-bin`, `--relay-log`, or both, caused the server to abort on start. This was because the entries in the index file overrode the new location. In addition, paths were calculated relative to datadir (rather than to the `--log-bin` or `--relay-log` values).

  The fix for this problem means that, when the server reads an entry from the index file, it now checks whether the entry contains a relative path. If it does, the relative part of the path is replaced with the absolute path set using the `--log-bin` or `--relay-log` option. An absolute path remains unchanged; in such a case, the index must be edited manually to enable the new path or paths to be used. (Bug #11745230, Bug #12133)

- **InnoDB Storage Engine**: When doing a live downgrade from MySQL 5.6.4 or later, with `innodb_page_size` set to a value other than 16384, now the earlier MySQL version reports that the page size is incompatible with the older version, rather than crashing or displaying a “corruption” error. (Bug #13116225)

- **InnoDB Storage Engine**: Certain `CREATE TABLE` statements could fail for `InnoDB` child tables containing foreign key definitions. This problem affected Windows systems only, with the setting `lower_case_table_names=0`. It was a regression from MySQL bug #55222. (Bug #13083023, Bug #60229)

- **InnoDB Storage Engine**: Issuing `INSERT...ON DUPLICATE KEY` statements for `InnoDB` tables from concurrent threads could cause a deadlock, particularly with the `INSERT...ON DUPLICATE KEY UPDATE` form. The problem could also be triggered by issuing multiple `INSERT IGNORE` statements. The fix avoids deadlocks caused by the same row being accessed by more than one transaction. Deadlocks could still occur when multiple rows are inserted and updated simultaneously by different transactions in inconsistent order; those types of deadlocks require the standard error handling on the application side, of re-trying the transaction. (Bug #11759688, Bug #52020, Bug #12842206)

- An incorrect `InnoDB` assertion could cause the server to halt. This issue only affected debug builds. The assertion referenced the source file `btr0pcur.ic` and the variable `cursor->pos_state`. (Bug #13358468)

- Locale information for `FORMAT()` function instances was lost in view definitions. (Bug #63020, Bug #13344643)

- The `handle_segfault()` signal-handler code in `mysqld` could itself crash due to calling unsafe functions. (Bug #54082, Bug #11761576)

- Enabling `myisam_use_mmap` could cause the server to crash. (Bug #48726, Bug #11756764)

- Concurrent access to `ARCHIVE` tables could cause corruption. (Bug #42784, Bug #11751793)

D.1.4. Changes in MySQL 5.5.19 (08 December 2011)

Functionality Added or Changed

- **Replication**: Previously, replication slaves could connect to the master server through master accounts that use nonnative authentication, except Windows native authentication. This is now also true for Windows native authentication.

- Performance of metadata locking operations on Windows XP systems was improved by instituting a cache for metadata lock objects. This permits the server to avoid expensive operations for creation and destruction of synchronization objects on XP. A new system variable, `metadata_locks_cache_size`, permits control over the size of the cache. The default size is 1024. (Bug #12695572)

Bugs Fixed

- **Important Change**: **InnoDB Storage Engine**: If an `ALTER TABLE` statement failed for an `InnoDB` table due to an error code from an underlying file-renaming system call, `InnoDB` could lose track of the `.ibd` file for the table. This issue only occurred when the `innodb_file_per_table` configuration option was enabled, and when the low-level error persisted through thousands of retry attempts. In MySQL 5.1, this issue applied to the InnoDB Plugin but not the built-in InnoDB storage engine.

  For example, if you encounter an error like the following:

  ```
  mysql> alter table sb2 add column d2 int;
  ERROR 1025 (HY000): Error on rename of './sbtest/#sql-1eb9_1' to
  './sbtest/sb2' (errno: -1)
  ```

  you might be able to access the `#sql*` table by copying a `.frm` file from a table with an identical schema. The table name to use for the `.frm` filewould be `` `sbtest.#mysql50##sql-1eb9_1` `` in the preceding example. (Bug #12884631, Bug #62146)

- **InnoDB Storage Engine**: An internal deadlock could occur within `InnoDB`, on a server doing a substantial amount of change buffering for DML operations, particularly `DELETE` statements. (Bug #13340047)

- **Replication**: When a statement containing a large number of rows to be applied on a slave table that does not contain a primary key, a considerable amount of time can be needed to find and change all the rows that are to be changed. The current fix helps diagnose this issue by printing a message to the error log if the execution time for a given statement replicated using row-based replication takes more than 60 seconds. `log_warnings` must be greater than 1 for this message to be printed to the error log. (Bug #11760927, Bug #53375)

- Rounding `DBL_MAX` returned `DBL_MAX`, not 'inf'. (Bug #13261955)

- Deadlock could occur when these four things happened at the same time: 1) An old dump thread was waiting for the binary log to grow. 2) The slave server that replicates from the old dump thread tried to reconnect. During reconnection, the new dump thread tried to kill the old dump thread. 3) A `KILL` statement tried to kill the old dump thread. 4) An `INSERT` statement caused a binary log rotation. (Bug #56299, Bug #11763573)

- If a plugin was uninstalled, thread local variables for plugin variables of string type with wth `PLUGIN_VAR_MEMALLOC` flag were not freed. (Bug #56652, Bug #11763882)

- `mysql_upgrade` did not upgrade the system tables or create the `mysql_upgrade_info` file when run with the `--write-binlog` or `--skip-write-binlog` option. (Bug #60223, Bug #11827359)

D.1.5. Changes in MySQL 5.5.18 (16 November 2011)

Functionality Added or Changed

- Upgrading from an `Advanced GPL` RPM package to an `Advanced` RPM package did not work. Now on Linux it is possible to use `rpm -U` to replace any installed MySQL product by any other of the same release family. It is not necessary to remove the old produce with `rpm -e` first. (Bug #11886309)

Bugs Fixed

- **Performance**: **InnoDB Storage Engine**: The process of deallocating the `InnoDB` Adaptive Hash Index was made faster, during shutdown or when turning off the AHI with the statement:

  ```
  SET GLOBAL innodb_adaptive_hash_index=OFF;
  ```

  (Bug #13006367, Bug #62487)

- **Incompatible Change**: **Replication**: The statements in the following list are now marked as unsafe for statement-based replication. This is due to the fact that each of these statements depends on the results of a `SELECT` statement whose order cannot al-

ways be determined. When using `STATEMENT` logging mode, a warning is issued in the binary log for any of these statements; when using `MIXED` logging mode, the statement is logged using the row-based format.

- `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE`
- `REPLACE ... SELECT`
- `CREATE TABLE ... IGNORE SELECT`
- `CREATE TABLE ... REPLACE SELECT`
- `INSERT IGNORE ... SELECT`
- `UPDATE IGNORE`

When upgrading, you should note the use of these statements in your applications, keeping in mind that a statement that inserts or replaces rows obtained from a `SELECT` can take up many times as much space in the binary log when logged using row-based format than when only the statement itself is logged. Depending on the number and size of the rows selected and inserted (or replaced) by any such statements, the difference in size of the binary log after the logging of these statements is switched from statement-based to row-based can potentially be several orders of magnitude. See Section 15.1.2.1, "Advantages and Disadvantages of Statement-Based and Row-Based Replication". (Bug #11758262, Bug #50439)

- **InnoDB Storage Engine**: Fixed a compilation problem that affected the `InnoDB` source code with `gcc` 4.6.1. The affected `InnoDB` source file was `btr/btr0cur.c`. (Bug #13116045)
- **InnoDB Storage Engine**: An `UPDATE` statement for an `InnoDB` table could hang. The issue affects tables using the Barracuda file format and having multiple indexes on column prefixes. The size of an undo log record could exceed the page size, even though the total size of the column prefixes was less than the page size (usually 16KB). In MySQL 5.5 and higher, this error is now reported using the new code `ER_UNDO_RECORD_TOO_BIG`. In MySQL 5.1 with the InnoDB Plugin, this error is reported using the existing code `ER_TOO_BIG_ROWSIZE`. (Bug #12547647)
- **Replication**: A replication master could send damaged events to slaves after the binary log disk on the master became full. To correct this issue, only complete events are now pushed by the master dump thread to the slave I/O thread. In addition, the error text that the master sends to the slave when an incomplete event is found now states that the incomplete event may have been caused by running out of disk space on the master, and provides coordinates of the first and the last event bytes read. (Bug #11747416, Bug #32228)

  References: See also Bug #64035, Bug #13593869.
- During the table-opening process, memory was allocated and later freed that was needed view loading, even for statements that did not use views. These unnecessary allocation and free operations are no longer done. (Bug #13116518)
- `mysql_plugin` returned the wrong error code from failed server bootstrap execution. (Bug #12968567)
- `mysql_plugin` mishandled the `--plugin-ini`, `--mysqld`, and `--my-print-defaults` options under some circumstances. (Bug #12968815)
- Several improvements were made to the `libedit` library bundled with MySQL distributions, and that is available for all platforms that MySQL supports except Windows.
  - Navigation keys did not work for UTF-8 input.
  - Word navigation and delete operations did not work for UTF-8 input with Cyrillic characters.
  - Nonlatin characters were corrupted in overwrite mode for UTF-8 input.
  - Long queries caused the statement history file to become corrupted.
  - The Alt key caused history operations to fail.

  (Bug #12605400, Bug #12613725, Bug #12618092, Bug #12624155, Bug #12617651, Bug #12605388)
- `OPTIMIZE TABLE` could corrupt `MyISAM` tables if `myisam_use_mmap` was enabled. (Bug #49030, Bug #11757032)
- `ARCHIVE` tables with `NULL` columns could cause server crashes or become corrupt under concurrent load. (Bug #51252, Bug #11758979)
- A query that selected a `GROUP_CONCAT()` function result could return different values depending on whether an `ORDER BY` of the function result was present. (Bug #41090, Bug #11750518)
- For `FEDERATED` tables, loss of connection to the remote table during some insert operations could cause a server crash. (Bug

#34660, Bug #11747970)

D.1.6. Changes in MySQL 5.5.17 (19 October 2011)

Functionality Added or Changed

- **Replication**: Previously, replication slaves could connect to the master server only through master accounts that use native authentication. Now replication slaves can also connect through master accounts that use nonnative authentication (except Windows native authentication) if the required client-side plugin is installed on the slave side in the directory named by the slave `plugin_dir` system variable. The exception for Windows is lifted in MySQL 5.5.19. (Bug #12897501)
- The `make_win_bin_dist` script is no longer used and has been removed from MySQL distributions and the manual. (Bug #58241)
- `MEMORY` table creation time is now available in the `CREATE_TIME` column of the `INFORMATION_SCHEMA.TABLES` table and the `Create_time` column of `SHOW TABLE STATUS` output. (Bug #51655, Bug #11759349)

Bugs Fixed

- **Performance**: **InnoDB Storage Engine**: This fix improves the performance of instrumentation code for `InnoDB` buffer pool operations. (Bug #12950803, Bug #62294)
- **InnoDB Storage Engine**: Lookups using secondary indexes could give incorrect matches under a specific set of conditions. The conditions involve an index defined on a column prefix, for a BLOB or other long column stored outside the index page, with a table using the Barracuda file format. (Bug #12601439, Bug #12543666)
- **InnoDB Storage Engine**: This fix corrects cases where the MySQL server could hang or abort with a `long semaphore wait` message. (This is a different issue than when these symptoms occurred during a `CHECK TABLE` statement.) (Bug #11766591, Bug #59733)
- Internal conversion of zero to binary and back could yield a result with incorrect precision. (Bug #12911710)
- Valgrind warnings generated by `filesort` operations were fixed. (Bug #12856915)
- `mysqld_safe` did not properly check for an already running instance of `mysqld`. (Bug #11878394)
- With Valgrind enabled, `InnoDB` semaphore wait timeouts were too low and could expire. (Bug #11765460)
- The help message for `mysql_install_db` did not indicate that it supports the `--defaults-file`, `--defaults-extra-file` and `--no-defaults` options. (Bug #58898, Bug #11765888)
- `myisampack` could create corrupt `FULLTEXT` indexes when compressing tables. (Bug #53646, Bug #11761180)
- An assertion designed to detect zero-length sort keys also was raised when the entire key set fit in memory. (Bug #58200, Bug #11765254)
- A linking problem prevented the `FEDERATED` storage engine plugin from loading. (Bug #40942, Bug #11750417)

D.1.7. Changes in MySQL 5.5.16 (15 September 2011)

External Authentication

- Commercial distributions of MySQL now include two plugins that enable MySQL Server to use external authentication methods to authenticate MySQL users:
  - PAM (Pluggable Authentication Modules) enables a system to access various kinds of authentication methods through a standard interface. A PAM authentication plugin enables MySQL Server to use PAM to authenticate MySQL users.

    The PAM plugin uses the information passed to it by the MySQL server (such as user name, host name, password, and authentication string), plus whatever is available for PAM lookup (such as Unix passwords or an LDAP directory). The plugin checks the user credentials against PAM and returns success or failure.

    The PAM authentication plugin has been tested on Linux and Mac OS X.

> **Note**
>
> The PAM plugin works with a client-side plugin that simply sends the password to the server in clear text so it can be passed to PAM. This may be a security problem in some configurations, but is necessary to use the server-side PAM library. To avoid problems if there is any possibility that the password would be intercepted, clients should connect to MySQL Server using SSL. See Section 5.5.6.4, "The Clear-Text Client-Side Authentication Plugin".

- Distributions of MySQL for Windows include an authentication plugin that enables MySQL Server to use native Windows services to authenticate client connections. Users who have logged in to Windows can connect from MySQL client programs to the server based on the information in their environment without specifying an additional password.

  The client and server exchange data packets in the authentication handshake. As a result of this exchange, the server creates a security context object that represents the identity of the client in the Windows OS. This identity includes the name of the client account. The Windows authentication plugin uses the identity of the client to check whether it is a given account or a member of a group. By default, negotiation uses Kerberos to authenticate, then NTLM if Kerberos is unavailable.

  The Windows authentication plugin should work on Windows 2000 Professional

These authentication plugins enable MySQL Server to accept connections from users defined outside the MySQL grant tables. They also support the MySQL proxy-user capability. Each plugin can return to MySQL a user name different from the login user, which means that the plugin can return the MySQL user that defines the privileges the externally authenticated user should have. For example, an external user named `joe` can connect and have the privileges of the MySQL user named `developer`.

The server-side PAM and Windows authentication plugins are included only in commercial distributions. They are not included in MySQL community distributions. The client-side plugins with which they communicate are included in all distributions, including community distributions. This permits clients from any release to connect to a server that has the server-side plugin loaded.

For more information about these plugins, see Section 5.5.6.2, "The PAM Authentication Plugin", and Section 5.5.6.3, "The Windows Native Authentication Plugin". For general information about pluggable authentication in MySQL, see Section 5.5.6, "Pluggable Authentication". For proxy user information, see Section 5.5.7, "Proxy Users".

Thread Pool Plugin Notes

- The default thread-handling model in MySQL Server executes statements using one thread per client connection. As more clients connect to the server and execute statements, overall performance degrades. Commercial distributions of MySQL now include a thread pool plugin that provides an alternative thread-handling model designed to reduce overhead and improve performance. The plugin implements a thread pool that increases server performance by efficiently managing statement execution threads for large numbers of client connections.

  The thread pool addresses several problems of the one thread per connection model:

  - Too many thread stacks make CPU caches almost useless in highly parallel execution workloads. The thread pool promotes thread stack reuse to minimize the CPU cache footprint.

  - With too many threads executing in parallel, context switching overhead is high. This also presents a challenging task to the operating system scheduler. The thread pool controls the number of active threads to keep the parallelism within the MySQL server at a level that it can handle and that is appropriate for the server host on which MySQL is executing.

  - Too many transactions executing in parallel increases resource contention. In `InnoDB`, this increases the time spent holding central mutexes. The thread pool controls when transactions start to ensure that not too many execute in parallel.

  On Windows, the thread pool plugin requires Windows Vista or newer. On Linux, the plugin requires kernel 2.6.9 or newer.

  For more information, see Section 7.11.6, "The Thread Pool Plugin".

Functionality Added or Changed

- **Important Change**: **Replication**: The `RESET SLAVE` statement has been extended with an `ALL` keyword. In addition to deleting the `master.info`, `relay-log.info`, and all relay log files, `RESET SLAVE ALL` also clears all connection information otherwise held in memory following execution of `RESET SLAVE`. (Bug #11809016)

- A new utility, `mysql_plugin`, enables MySQL administrators to manage which plugins a MySQL server loads. It provides an alternative to manually specifying the `--plugin-load` option at server startup or using the `INSTALL PLUGIN` and `UN-`

`INSTALL PLUGIN` statements at runtime. See Section 4.4.4, "`mysql_plugin` — Configure MySQL Server Plugins".

- Some plugins operate in such a matter that they should be loaded at server startup, and not loaded or unloaded at runtime. The plugin API now supports marking plugins this way. The `st_mysql_plugin` structure now has a `flags` member, which can be set to the OR of the applicable flags. The `PLUGIN_OPT_NO_INSTALL` flag indicates that the plugin cannot be loaded at runtime with the `INSTALL PLUGIN` statement. This is appropriate for plugins that must be loaded at server startup with the `--plugin-load` option. The `PLUGIN_OPT_NO_UNINSTALL` flag indicates that the plugin cannot be unloaded at runtime with the `UNINSTALL PLUGIN` statement.

  The new member changes the interface, so the plugin interface version, `MYSQL_PLUGIN_INTERFACE_VERSION`, has been incremented from `0x0102` to `0x0103`. Plugins that require access to the new member must be recompiled to use version `0x0103` or higher.

- The thread pool plugin should be loaded at server startup, and not loaded or unloaded at runtime. An error now occurs for attempts to load or unload it with the `INSTALL PLUGIN` or `UNINSTALL PLUGIN` statement.

Bugs Fixed

- **Performance**: **InnoDB Storage Engine**: This fix improves the performance of operations on `VARCHAR(N)` columns in `InnoDB` tables, where `N` is declared as a large value but the actual string values in the table are short. (Bug #12835650)

- **Performance**: **InnoDB Storage Engine**: The "random read-ahead" feature that was removed from the `InnoDB` Plugin is now available again. Because it is only helpful for certain workloads, it is turned off by default. To turn it on, enable the `innodb_random_read_ahead` configuration option. Because this feature can improve performance in some cases and reduce performance in others, before relying on this setting, benchmark both with and without the setting enabled. (Bug #12356373)

- **Incompatible Change**: Handling of a date-related assertion was modified.

  However, a consequence of this change is that several functions become more strict when passed a `DATE()` function value as their argument and reject incomplete dates with a day part of zero. These functions are affected: `CONVERT_TZ()`, `DATE_ADD()`, `DATE_SUB()`, `DAYOFYEAR()`, `LAST_DAY()`, `TIMESTAMPDIFF()`, `TO_DAYS()`, `TO_SECONDS()`, `WEEK()`, `WEEKDAY()`, `WEEKOFYEAR()`, `YEARWEEK()`. Because this changes date-handling behavior in General Availability-status series (MySQL 5.1 and 5.5), it was reverted in 5.1.62 and 5.5.21. The change is retained in MySQL 5.6.

  References: See also Bug #13458237.

- **InnoDB Storage Engine**: The `DATA_LENGTH` column in the `INFORMATION_SCHEMA.TABLES` table now correctly reports the on-disk sizes of tablespaces for `InnoDB` compressed tables. (Bug #12770537)

- **InnoDB Storage Engine**: With the configuration settings `innodb_file_per_table=1` and `innodb_file_format=Barracuda`, inserting a column value greater than half the page size, and including that column in a secondary index, could cause a crash when that column value was updated. (Bug #12637786)

- **InnoDB Storage Engine**: Unused functions were removed from the internal `InnoDB` code related to mini-transactions, to clarify the logic. (Bug #12626794, Bug #61240)

- **Replication**: Processing of corrupted table map events could cause the server to crash. This was especially likely if the events mapped different tables to the same identifier, such as could happen due to Bug #56226.

  Now, before applying a table map event, the server checks whether the table has already been mapped with different settings, and if so, an error is raised and the slave SQL thread stops. If it has been mapped with the same settings, or if the table is set to be ignored by filtering rules, there is no change in behavior: the event is skipped and IDs are not checked. (Bug #44360, Bug #11753004)

  References: See also Bug #11763509.

- The metadata locking subsystem added too much overhead for `INFORMATION_SCHEMA` queries that were processed by opening only `.frm` or `.TRG` files and had to scan many tables. For example, `SELECT COUNT(*) FROM INFORMATION_SCHEMA.TRIGGERS` was affected. (Bug #12828477)

- Compilation failed on Mac OS X 10.7 (Lion) with a warning: `Implicit declaration of function 'pthread_init'` (Bug #12779790)

- With profiling disabled or not compiled in, `set_thd_proc_info()` unnecessarily checked file name lengths. (Bug #12756017)

  References: This bug is a regression of Bug #59273.

- A `DBUG_ASSERT` added by Bug #11792200 was overly aggressive in raising assertions. (Bug #12537160)

- `CHECK TABLE` and `REPAIR TABLE` failed to find problems with `MERGE` tables that had underlying tables missing or with the wrong storage engine. Issues were reported only for the first underlying table. (Bug #11754210)
- `(5 DIV 2)` and `(5.0 DIV 2)` produced different results (2 versus 3) because the result of the latter expression was not truncated before conversion to integer. This differed from the behavior in MySQL 5.0 and 5.1. Now both expressions produce 2. (Bug #61676, Bug #12711164)
- For a `lower_case_table_names` value of 1 or 2 and a database having a mixed-case name, calling a stored function using a fully qualified name including the database name failed. (Bug #60347, Bug #11840395)
- The embedded server crashed when `argc = 0`. (Bug #57931, Bug #12561297)
- `SELECT DISTINCT` with a deterministic stored function in the `WHERE` clause could produce incorrect results. (Bug #59736, Bug #11766594)
- Upgrades using an RPM package recreated the `test` database, which is undesirable when the DBA had removed it. (Bug #45415, Bug #11753896)
- The `mysql_affected_rows()` C API function returned 3 (instead of 2) for `INSERT ... ON DUPLICATE KEY UPDATE` statements where there was a duplicated key value. (Bug #46675, Bug #11754979)
- `CREATE TABLE` without an `ENGINE` option determined the default engine at parse rather than execution time. This led to incorrect results if the statement was executed within a stored program and the default engine had been changed in the meantime. (Bug #50614, Bug #11758414)

D.1.8. Changes in MySQL 5.5.15 (28 July 2011)

Functionality Added or Changed

- The undocumented `--all` option for `perror` is deprecated and will be removed in MySQL 5.6.

Bugs Fixed

- **Performance**: **InnoDB Storage Engine**: The `DROP TABLE` command for an `InnoDB` table could be very slow, in a configuration with a combination of table compression, partitioning, and a large buffer pool. (Bug #12635227, Bug #61188)
- **InnoDB Storage Engine**: A failed `CREATE INDEX` operation for an `InnoDB` table could result in some memory being allocated but not freed. This memory leak could affect tables created with the `ROW_FORMAT=DYNAMIC` or `ROW_FORMAT=COMPRESSED` setting. (Bug #12699505)
- **Partitioning**: Auto-increment columns of partitioned tables were checked even when they were not being written to. In debug builds, this could lead to a server crash. (Bug #11765667, Bug #58655)
- **Partitioning**: The `UNIX_TIMESTAMP()` function was not treated as a monotonic function for purposes of partition pruning. (Bug #11746819, Bug #28928)
- **Replication**: If a `LOAD DATA INFILE` statement—replicated using statement-based replication—featured a `SET` clause, the name-value pairs were regenerated using a method (`Item::print()`) intended primarily for generating output for statements such as `EXPLAIN EXTENDED`, and which cannot be relied on to return valid SQL. This could in certain cases lead to a crash on the slave.

  To fix this problem, the server now names each value in its original, user-supplied form, and uses that to create `LOAD DATA INFILE` statements for statement-based replication. (Bug #60580, Bug #11902767)

  References: See also Bug #34283, Bug #11752526, Bug #43746.
- Compiling the server with maintainer mode enabled failed for `gcc` 4.6 or higher. (Bug #12727287)
- The option-parsing code for empty strings leaked memory. (Bug #12589928)
- `mysql_list_fields()` returned incorrect character set information for character columns of views. (Bug #12337762)
- Previously, an inappropriate error message was produced if a multiple-table update for an `InnoDB` table with a clustered primary key would update a table through multiple aliases, and perform an update that may physically move the row in at least one of these aliases. Now the error message is: `Primary key/partition key update is not permitted since the table is updated both as 'tbl_name1' and 'tbl_name2'` (Bug #11882110)

References: See also Bug #11764529.

- `ALTER TABLE {MODIFY|CHANGE} ... FIRST` did nothing except rename columns if the old and new versions of the table had exactly the same structure with respect to column data types. As a result, the mapping of column name to column data was incorrect. The same thing happened for `ALTER TABLE DROP COLUMN ... ADD COLUMN` statements intended to produce a new version of the table with exactly the same structure as the old version. (Bug #61493, Bug #12652385)

- In debug builds, `Field_new_decimal::store_value()` was subject to buffer overflows. (Bug #55436, Bug #11762799)

- `LOAD DATA INFILE` incorrectly parsed relative data file path names that ascended more than three levels in the file system and as a consequence was unable to find the file. (Bug #60987, Bug #12403662)

- Incorrect handling of metadata locking for `FLUSH TABLES WITH READ LOCK` for statements requiring prelocking caused two problems:

  - Execution of any data-changing statement that required prelocking (that is, involved a stored function or trigger) as part of a transaction slowed down somewhat all subsequent statements in the transaction. Performance in a transaction that periodically involved such statements gradually degraded over time.

  - Execution of any data-changing statement that required prelocking as part of a transaction prevented a concurrent `FLUSH TABLES WITH READ LOCK` from proceeding until the end of the transaction rather than at the end of the particular statement.

  (Bug #61401, Bug #12641342)

- For `MyISAM` tables, attempts to insert incorrect data into an indexed `GEOMETRY` column could result in table corruption. (Bug #57323, Bug #11764487)

- The fractional part of the "Queries per second" value could be displayed incorrectly in MySQL status output (for example, in the output from `mysqladmin status` or the `mysql STATUS` command). (Bug #61205, Bug #12565712)

- For unknown users, the native password plugin reported incorrectly that no password had been specified even when it had. (Bug #59792, Bug #11766641)

- A race condition between loading a stored routine using the name qualified by the database name and dropping that database resulted in a spurious error message: `The table mysql.proc is missing, corrupt, or contains bad data` (Bug #47870, Bug #11756013)

D.1.9. Changes in MySQL 5.5.14 (05 July 2011)

Functionality Added or Changed

- **Incompatible Change**: In the audit plugin interface, the `event_class` member was removed from the `mysql_event_general` structure and the calling sequence for the notification function was changed. Originally, the second argument was a pointer to the event structure. The function now receives this information as two arguments: an event class number and a pointer to the event. Corresponding to these changes, `MYSQL_AUDIT_INTERFACE_VERSION` was increased to `0x0300`.

  The `plugin_audit.h` header file, and the `NULL_AUDIT` example plugin in the `plugin/audit_null` directory were modified per these changes. See Section 22.2.4.8, "Writing Audit Plugins".

- **InnoDB Storage Engine**: `InnoDB` now permits concurrent reads while creating a secondary index. (Bug #11853126)

  References: See also Bug #11751388, Bug #11784056, Bug #11815600.

- `CMake` configuration support on Linux now provides a boolean `ENABLE_GCOV` option to control whether to include support for `gcov`. (Bug #12549572)

- Client programs now display more information for SSL errors to aid in diagnosis and debugging of connection problems. (Bug #21287, Bug #11745920)

Bugs Fixed

- **Replication**: A mistake in thread cleanup could cause a replication master to crash. (Bug #12578441)

- **Replication**: When using row-based replication and attribute promotion or demotion (see Section 15.4.1.6.2, “Replication of Columns Having Different Data Types”), memory allocated internally for conversion of `BLOB` columns was not freed afterwards. (Bug #12558519)
- Adding support for Windows authentication to `libmysql` introduced a link dependency on the system Secur32 library. The Microsoft Visual C++ link information now pulls in this library automatically. (Bug #12612143)
- In some cases, memory allocated for `Query_tables_list::sroutines()` was not freed properly. (Bug #12429877)
- After the fix for Bug #11889186, `MAKEDATE()` arguments with a year part greater than 9999 raised an assertion. (Bug #12403504)
- An assertion could be raised due to a missing `NULL` value check in `Item_func_round::fix_length_and_dec()`. (Bug #12392636)
- An assertion could be raised during two-phase commits if the binary log was used as the transaction coordinator log. (Bug #12346411)
- An embedded client aborted rather than issuing an error message if it issued a `TEE` command (`\T file_name`) and the directory containing the file did not exist. This occurred because the wrong error handler was called. (Bug #57491, Bug #11764633)
- Using `CREATE EVENT IF NOT EXISTS` for an event that already existed and was enabled caused multiple instances of the event to run. (Bug #61005, Bug #12546938)
- A problem introduced in MySQL 5.5.11 caused very old (MySQL 4.0) clients to be unable to connect to the server. (Bug #61222, Bug #12563279)
- `ALTER EVENT` could change the event status. (Bug #57156, Bug #11764334)
- On some platforms, the `Incorrect value: xxx for column yyy at row zzz` error produced by `LOAD DATA INFILE` could have an incorrect value of *`zzz`*. (Bug #46895, Bug #11755168)
- An attempt to install nonexistent files during installation was corrected. (Bug #43247, Bug #11752142)
- On FreeBSD 64-bit builds of the embedded server, exceptions were not prevented from propagating into the embedded application. (Bug #38965, Bug #11749418)

D.1.10. Changes in MySQL 5.5.13 (31 May 2011)

> **Note**
>
> Very old (MySQL 4.0) clients are not working temporarily due to a problem discovered after the release of MySQL 5.5.12. We are looking at fixing the problem. Update: This is fixed in MySQL 5.5.14.

Functionality Added or Changed

- The client-side plugin that accompanies the server-side Windows authentication plugin is now included in all MySQL distributions. This will permit clients from any release, whether commercial or community, to connect to a server that has the server-side plugin loaded. See Section 5.5.6.3, “The Windows Native Authentication Plugin” (Bug #59780, Bug #11766631)

Bugs Fixed

- **InnoDB Storage Engine**: The MySQL server could hang during `CREATE TABLE`, `OPTIMIZE TABLE`, or `ALTER TABLE` or other DDL operation that performs a table copy for an `InnoDB` table, if such operations were performed by multiple sessions simultaneously. The error was reported as:

  ```
  InnoDB: Error: semaphore wait has lasted > 600 seconds
  ```

  (Bug #11760042, Bug #52409)
- **InnoDB Storage Engine**: If the server crashed while an XA transaction was prepared but not yet committed, the transaction could remain in the system after restart, and cause a subsequent shutdown to hang. (Bug #11766513, Bug #59641)
- **InnoDB Storage Engine**: With the setting `lower_case_table_names=2`, inserts into `InnoDB` tables covered by foreign key constraints could fail after a server restart. This is a similar problem to the foreign key error in Bug #11831040 / Bug

#60196 / Bug #60909, but with a different root cause and occurring on Mac OS X.

- **Partitioning**: The internal `get_partition_set()` function did not take into account the possibility that a key specification could be `NULL` in some cases. (Bug #12380149)

- **Partitioning**: When executing a row-ordered retrieval index merge, the partitioning handler used memory from that allocated for the table, rather than that allocated to the query, causing table object memory not to be freed until the table was closed. (Bug #11766249, Bug #59316)

- **Replication**: When `mysqlbinlog` was invoked using `--base64-output=decode-row` and `--start-position=pos`, (where *`pos`* is a point in the binary log past the format description log event), a spurious error of the type shown here was generated:

```
MALFORMED BINLOG: IT DOES NOT CONTAIN ANY FORMAT_DESCRIPTION_LOG_EVENT...
```

  However, since there is nothing unsafe about not printing the format description log event, the error has been removed for this case. (Bug #12354268)

- **Replication**: Typographical errors appeared in the text of several replication error messages. (The word “position” was misspelled as “postion”.) (Bug #11762616, Bug #55229)

- Assignments to `NEW.var_name` within triggers, where *`var_name`* had a `BLOB` or `TEXT` type, were not properly handled and produced incorrect results. (Bug #12362125)

- `XA COMMIT` could fail to clean up the error state if it discovered that the current XA transaction had to be rolled back. Consequently, the next XA transaction could raise an assertion when it checked for proper cleanup of the previous transaction. (Bug #12352846)

- Internal Performance Schema header files were unnecessarily installed publicly. (Bug #53281)

- With the conversion from GNU autotools to `CMake` for configuring MySQL, the `USE_SYMDIR` preprocessor symbol was omitted. This caused failure of symbolic links (described at Section 7.11.3.1, “Using Symbolic Links”). (Bug #59408, Bug #11766320)

- `LOAD DATA INFILE` errors could leak I/O cache memory. (Bug #58072, Bug #11765141)

- The server did not check for certain invalid out of order sequences of XA statements, and these sequences raised an assertion. (Bug #59936, Bug #11766752, Bug #12348348)

- In `Item_func_in::fix_length_and_dec()`, a Valgrind warning for uninitialized values was corrected. (Bug #59270, Bug #11766212)

- An incorrect `max_length` value for `YEAR` values could be used in temporary result tables for `UNION`, leading to incorrect results. (Bug #59343, Bug #11766270)

- An internal client macro reference was removed from the `client_plugin.h` header file. This reference made the file unusable. (Bug #60746, Bug #12325444)

- For `LOAD DATA INFILE`, multibyte character sequences could be pushed onto a stack too small to accommodate them. (Bug #58069, Bug #11765139)

- In `ROUND()` calculations, a Valgrind warning for uninitialized memory was corrected. (Bug #58937, Bug #11765923)

  References: This bug is a regression of Bug #33143.

- Valgrind warnings caused by comparing index values to an uninitialized field were corrected. (Bug #58705, Bug #11765713)

- For repeated invocation of some stored procedures, the server consumed memory that it did not release until the connection terminated. (Bug #60025, Bug #11848763)

- The optimizer sometimes incorrectly processed `HAVING` clauses for queries that did not also have an `ORDER BY` clause. (Bug #48916, Bug #11756928)

- `PROCEDURE ANALYZE()` could leak memory for `NULL` results, and could return incorrect results if used with a `LIMIT` clause. (Bug #48137, Bug #11756242)

- On Linux, the `mysql` client built using the bundled `libedit` did not read `~/.editrc`. (Bug #49967, Bug #11757855)

- With `DISTINCT`, `CONCAT(col_name,...)` returned incorrect results when the arguments to `CONCAT()` were columns with an integer data type declared with a display width narrower than the values in the column. (For example, if an `INT(1)` column contained `1111`.) (Bug #4082)

D.1.11. Changes in MySQL 5.5.12 (05 May 2011)

Functionality Added or Changed

- When invoked with the `--auto-generate-sql` option, `mysqlslap` dropped the schema specified with the `--create-schema` option at the end of the test run, which may have been unexpected by the user. `mysqlslap` no longer drops the schema, but has a new `--create-and-drop-schema` option that both creates and drops a schema. (Bug #58090, Bug #11765157)

Bugs Fixed

- **InnoDB Storage Engine**: **Replication**: Trying to update a column, previously set to `NULL`, of an `InnoDB` table with no primary key caused replication to fail with `CAN'T FIND RECORD IN 'TABLE' ON THE SLAVE`. (Bug #11766865, Bug #60091)
- **InnoDB Storage Engine**: The server could halt if `InnoDB` interpreted a very heavy I/O load for 15 minutes or more as an indication that the server was hung. This change fixes the logic that measures how long `InnoDB` threads were waiting, which formerly could produce false positives. (Bug #11877216, Bug #11755413, Bug #47183)
- **InnoDB Storage Engine**: With the setting `lower_case_table_names=2`, inserts into `InnoDB` tables covered by foreign key constraints could fail after a server restart. (Bug #11831040, Bug #60196, Bug #60909)
- **Replication**: Using the `--server-id` option with `mysqlbinlog` could cause format description log events to be filtered from the binary log, leaving `mysqlbinlog` unable to read the remainder of the log. Now such events are always read without regard to the value of this option.

  As part of the the fix for this problem, `mysqlbinlog` now also reads rotate log events without regard to the value of `--server-id`. (Bug #59530, Bug #11766427)
- On Windows, the server rejected client connections if no DNS server was available. (Bug #12325375)
- `mysql_upgrade` did not properly upgrade the `authentication_string` column of the `mysql.user` table. (Bug #11936829)
- `InnoDB` invoked some `zlib` functions without proper initialization. (Bug #11849231)
- `CREATE TABLE` permitted a `TABLESPACE` table option but did not write the option value to the `.frm` file. (Bug #11769356)
- In `Item::get_date`, a Valgrind warning for a missing `NULL` value check was corrected. (Bug #59164, Bug #11766124)
- In `Item_func_month::val_str()`, a Valgrind warning for a too-late `NULL` value check was corrected. (Bug #59166, Bug #11766126)
- In `Item_func::val_decimal`, a Valgrind warning for a missing `NULL` value check was corrected. (Bug #59125, Bug #11766087)
- In `Item_func_str_to_date::val_str`, a Valgrind warning for an uninitialized variable was corrected. (Bug #58154, Bug #11765216)
- In `extract_date_time()`, a Valgrind warning for a missing end-of-string check was corrected. (Bug #59151, Bug #11766112)
- A missing variable initialization for `Item_func_set_user_var` objects could raise an assertion. (Bug #59527, Bug #11766424)
- In string context, the `MIN()` and `MAX()` functions did not take into account the unsignedness of a `BIGINT UNSIGNED` argument. (Bug #59132, Bug #11766094)
- With prepared statements, the server could attempt to send result set metadata after the table had been closed. (Bug #56115, Bug #11763413)
- When the server was started with the `--skip-innodb` option, it initialized the `have_innodb` system variable to `YES` rather than `DISABLED`. (Bug #59393, Bug #11766306)
- An assertion could be raised in `Item_func_int_val::fix_num_length_and_dec()` due to overflow for geometry functions. (Bug #57900, Bug #11764994)
- The server permitted `max_allowed_packet` to be set lower than `net_buffer_length`, which does not make sense because `max_allowed_packet` is the upper limit on `net_buffer_length` values. Now a warning occurs and the value remains unchanged. (Bug #59959, Bug #11766769)

- Selecting from a view for which the definition included a `HAVING` clause failed with an error:

```
1356: View '...' references invalid table(s) or column(s)
or function(s) or definer/invoker of view lack rights to use them
```

  (Bug #60295, Bug #11829681)

- `CREATE TABLE` syntax permits specification of a `STORAGE {DEFAULT|DISK|MEMORY}` option. However, this value was not written to the `.frm` file, so that a subsequent `CREATE TABLE ... LIKE` for the table did not include that option.

  Also, `ALTER TABLE` of a table that had a tablespace incorrectly destroyed the tablespace. (Bug #60111, Bug #11766883, Bug #34047, Bug #11747789)

- Comparison of a `DATETIME` stored program variable and `NOW()` resulted in "Illegal mix of collations error" when `character_set_connection` was set to `utf8`. (Bug #60625, Bug #11926811)

- With `lower_case_table_names=2`, resolution of objects qualified by database names could fail. (Bug #50924, Bug #11758687)

- `SHOW EVENTS` did not always show events from the correct database. (Bug #41907, Bug #11751148)

D.1.12. Changes in MySQL 5.5.11 (07 April 2011)

Functionality Added or Changed

- `InnoDB` now permits concurrent reads on a table while creating nonprimary unique indexes. (This was found to create problems and was reverted in 5.5.12.) (Bug #11784056)

- Previously, Performance Schema instrumentation for both the binary log and the relay log used these instruments:

```
wait/io/file/sql/binlog
wait/io/file/sql/binlog_index
wait/synch/mutex/sql/MYSQL_BIN_LOG::LOCK_index
wait/synch/cond/sql/MYSQL_BIN_LOG::update_cond
```

  Now instrumentation for the relay log uses these instruments, which makes it possible to distinguish binary log and relay log events:

```
wait/io/file/sql/relaylog
wait/io/file/sql/relaylog_index
wait/synch/mutex/sql/MYSQL_RELAY_LOG::LOCK_index
wait/synch/cond/sql/MYSQL_RELAY_LOG::update_cond
```

  (Bug #59658, Bug #11766528)

- MySQL distributions now include an `INFO_SRC` file that contains information about the source distribution, such as the MySQL version from which it was created. MySQL binary distributions additionally include an `INFO_BIN` file that contains information about how the distribution was built, such as compiler options and feature flags. In RPM packages, these files are located in the `/usr/share/doc/packages/MySQL-server` directory. In `tar.gz` and derived packages, they are located in the `Docs` directory under the location where the distribution is unpacked. (Bug #42969, Bug #11751935)

- Previously, for queries that were aborted due to a sort problem or terminated with `KILL` in the middle of a sort, the server wrote the message `Sort aborted` to the error log. Now the server writes more information about the cause of the error. These causes include:

  - Insufficient disk space in the temporary file directory prevented a temp file from being created
  - Insufficient memory for `sort_buffer_size` to be allocated
  - Somebody ran `KILL id` in the middle of a filesort operation
  - The server was shut down while some queries were sorting
  - A transaction was rolled back or aborted due to a lock wait timeout or deadlock
  - Unexpected errors, such as a source table or even temp table was corrupt
  - Processing of a subquery failed which was also sorting

(Bug #30771, Bug #11747102)

- The undocumented `SHOW NEW MASTER` statement has been removed.
- For the Windows installer, debug information files and the embedded MySQL server have been removed from the standard MSI distribution file to reduce the download size for the majority of users.

  If these files are needed, the Zip distribution must be downloaded separately and be extracted in the installation directory, which is most probably `C:\Program Files\MySQL\MySQL Server 5.5` on English systems.

  Please note that upon product de-installation, these extracted files from the Zip distribution must be removed from the system manually.
- A new system variable, `max_long_data_size`, now controls the maximum size of parameter values that can be sent with the `mysql_stmt_send_long_data()` C API function. If not set at server startup, the default is the value of the `max_allowed_packet` system variable. This variable is deprecated. In MySQL 5.6, it is removed and the maximum parameter size is controlled by `max_allowed_packet`.

Bugs Fixed

- **Important Change**: The length of the `plugin` column of the `mysql.user` system table is increased to 64 characters. This is now the same size as the `name` column of the `mysql.plugin` table. (Bug #11766610, Bug #59752)
- **Partitioning**: A problem with a previous fix for poor performance of `INSERT ON DUPLICATE KEY UPDATE` statements on tables having many partitions caused the handler function for reading a row from a specific index to fail to store the ID of the partition last used. This caused some statements to fail with `CAN'T FIND RECORD` errors. (Bug #59297, Bug #11766232)

  References: This bug is a regression of Bug #52455.
- **Replication**: A failed `DROP DATABASE` statement could break statement-based replication. (Bug #58381, Bug #11765416)
- Two unused test files in `storage/ndb/test/sql` contained incorrect versions of the GNU Lesser General Public License. The files and the directory containing them have been removed. (Bug #11810224)

  References: See also Bug #11810156.
- Division of large numbers could cause stack corruption. (Bug #11792200)
- The server read one byte too many when trying to process an XML string lacking a closing single quote (`'`) or double quote (`"`) character used as an argument for `UpdateXML()` or `ExtractValue()`. (Bug #59901, Bug #11766725)

  References: See also Bug #44332, Bug #11752979.
- Aggregation followed by a subquery could produce an incorrect result. (Bug #59839, Bug #11766675)
- `mysqldump` did not quote database names in `ALTER DATABASE` statements in its output, which could cause an error at reload time for database names containing a dash. (Bug #59398, Bug #11766310)
- On some systems, debug builds of `comp_err` could fail due to an uninitialized variable. (Bug #59906, Bug #11766729)
- If a multiple-table update updated a row through two aliases and the first update physically moved the row, the second update failed to locate the row. This resulted in different errors depending on the storage engine, although these errors did not accurately describe the problem:

  - `MyISAM`: `Got error 134 from storage engine`
  - `InnoDB`: `Can't find record in 'tbl'`

  For `MyISAM`, which is nontransactional, the update executed first was performed but the second was not. In addition, for two equal multiple-table update statements, one could succeed and the other fail depending on whether the record actually moved, which is inconsistent.

  Now such an update returns an error if it will update a table through multiple aliases, and perform an update that may physically move the row in at least one of these aliases. (Bug #57373, Bug #11764529, Bug #55385, Bug #11762751)
- `SHOW WARNINGS` output following `EXPLAIN EXTENDED` could include unprintable characters. (Bug #57341, Bug #11764503)
- Attempting to create a spatial index on a `CHAR` column longer than 31 bytes led to an assertion failure if the server was com-

piled with safemutex support. (Bug #59888, Bug #11766714)

- An assertion was raised if an `XA COMMIT` was issued when an XA transaction had already encountered an error (such as a deadlock) that required the transaction to be rolled back. (Bug #59986, Bug #11766788)
- The `MYSQL_HOME` environment variable was being ignored. (Bug #59280, Bug #11766219)
- An incorrect character set pointer passed to `my_strtoll10_mb2()` caused an assertion to be raised. (Bug #59648, Bug #11766519)
- An assertion was raised if a statement tried to upgrade a metadata lock while there was an active `FLUSH TABLE tbl_list WITH READ LOCK` statement. Now if a statement tries to upgrade a metadata lock in this situation, the server returns an `ER_TABLE_NOT_LOCKED_FOR_WRITE` error to the client. (Bug #57649, Bug #11764779)
- The code for `PROCEDURE ANALYSE()` had a missing `DBUG_RETURN` statement, which could cause a server crash in debug builds. (Bug #58140, Bug #11765202)
- `CREATE TRIGGER` and `DROP TRIGGER` can change the prelocking list of stored routines, but the routine cache did not detect such changes, resulting in routine execution with an inaccurate locking list. (Bug #58674, Bug #11765684)
- On Windows, the `authentication_string` column recently added to the `mysql.user` table caused the Configuration Wizard to fail. (Bug #59038, Bug #11766011)
- The `mysql_load_client_plugin()` C API function did not clear the previous error. (Bug #60075, Bug #11766854)
- An invalid pathname argument for the `--defaults-extra-file` option of MySQL programs caused a program crash. (Bug #59234, Bug #11766184)
- `FIND_IN_SET()` could work differently in MySQL 5.5 than in 5.1. (Bug #59405, Bug #11766317)
- In some cases, `SHOW WARNINGS` returned an empty result when the previous statement failed. (Bug #55847, Bug #11763166)
- On Windows, an object in thread local storage could be used before the object was created. (Bug #55730, Bug #11763065)
- For a client connected using SSL, the `Ssl_cipher_list` status variable was empty and did not show the possible cipher types. (Bug #52596, Bug #11760210)
- When used to upgrade tables, `mysqlcheck` (and `mysql_upgrade`, which invokes `mysqlcheck`) did not upgrade some tables for which table repair was found to be necessary. In particular, it failed to upgrade `InnoDB` tables that needed repair, leaving them in a nonupgraded state. This occurred because:

  - `mysqlcheck --check-upgrade ---auto-repair` checks for tables that are incompatible with the current version of MySQL. It does this by issuing the `CHECK TABLE ... FOR UPGRADE` statement and examining the result.
  - For any table found to be incompatible, `mysqlcheck` issues a `REPAIR TABLE` statement. But this fails for storage engines such as `InnoDB` that do not support the repair operation. Consequently, the table remained unchanged.

  To fix the problem, the following changes were made to `CHECK TABLE ... FOR UPGRADE` and `mysqlcheck`. Because `mysql_upgrade` invokes `mysqlcheck`, these changes also fix the problem for `mysql_upgrade`.

  - `CHECK TABLE ... FOR UPGRADE` returns a different error if a table needs repair but its storage engine does not support `REPAIR TABLE`:

    Previous:

    ```
    Error: ER_TABLE_NEEDS_UPGRADE
    Table upgrade required. Please do "REPAIR TABLE `tbl_name`" or
    dump/reload to fix it!
    ```

    Now:

    ```
    Error: ER_TABLE_NEEDS_REBUILD
    Table rebuild required. Please do "ALTER TABLE `tbl_name` FORCE" or
    dump/reload to fix it!
    ```

  - `mysqlcheck` recognizes the new error and issues an `ALTER TABLE ... FORCE` statement. The `FORCE` option for `ALTER TABLE` was recognized but did nothing; now it is implemented and acts as a “null” alter operation that rebuilds the table.

  (Bug #47205, Bug #11755431)

- Bitmap functions used in one thread could change bitmaps used by other threads, raising an assertion. (Bug #43152, Bug #11752069)
- When `CASE ... WHEN` arguments had different character sets, 8-bit values could be referenced as `utf16` or `utf32` values, raising an assertion. (Bug #44793, Bug #11753363)

D.1.13. Changes in MySQL 5.5.10 (15 March 2011)

C API Notes

- **Incompatible Change**: The shared library version of the client library was increased to 18 to reflect ABI changes, and avoid compatibility problems with the client library in MySQL 5.1. Note that this is an incompatible change between 5.5.10 and earlier 5.5 versions, so client programs that use the 5.5 client library should be recompiled against the 5.5.10 client library. (Bug #60061, Bug #11827366)

Pluggable Authentication

- MySQL distributions now include `auth_socket`, a server-side authentication plugin that authenticates clients that connect from the local host through the Unix socket file. The plugin uses the `SO_PEERCRED` socket option to obtain information about the user running the client program (and thus can be built only on systems that support this option). For a connection to succeed, the plugin requires a match between the login name of the connecting client user and the MySQL user name presented by the client program. For more information, see Section 5.5.6.5, “The Socket Peer-Credential Authentication Plugin”. (Bug #59017, Bug #11765993, Bug #9411, Bug #11745104)
- MySQL distributions now include `mysql_clear_password`, a client-side authentication plugin that sends the password to the server without hashing or encryption. Although this is insecure, and thus appropriate precautions should be taken (such as using an SSL connection), the plugin is useful in conjunction with server-side plugins that must have access to the original password in clear text. For more information, see Section 5.5.6.4, “The Clear-Text Client-Side Authentication Plugin”.

Functionality Added or Changed

- The `mysql_upgrade`, `mysqlbinlog`, `mysqlcheck`, `mysqlimport`, `mysqlshow`, and `mysqlslap` clients now have `--default-auth` and `--plugin-dir` options for specifying which authentication plugin and plugin directory to use. (Bug #58139)
- Boolean system variables can be enabled at run time by setting them to the value `ON` or `OFF`, but previously this did not work at server startup. Now at startup such variables can be enabled by setting them to `ON` or `TRUE`, or disabled by setting them to `OFF` or `FALSE`. Any other nonnumeric variable is invalid. (Bug #46393)

  References: See also Bug #11754743, Bug #51631.
- Previously, for queries that were aborted due to a sort problem, the server wrote the message `Sort aborted` to the error log. Now the server writes more information to provide a more specific message, such as:

```
Sort aborted: Out of memory (Needed 24 bytes)
Out of sort memory, consider increasing server sort buffer size
Sort aborted: Out of sort memory, consider increasing server sort
  buffer size
Sort aborted: Incorrect number of arguments for FUNCTION test.f1;
  expected 0, got 1
```

  In addition, if the server was started with `--log-warnings=2`, the server writes information about the host, user, and query. (Bug #36022, Bug #11748358)
- `mysqldump --xml` now displays comments from column definitions. (Bug #13618, Bug #11745324)

Bugs Fixed

- **Security Fix**: Bug #36544 was fixed.
- **Important Change**: **InnoDB Storage Engine**: The `libaio` library, which has been used on Linux systems since MySQL 5.5.4, is now linked into `mysqld` dynamically rather than statically. If the library is not already on your Linux system, install it using the appropriate package manager for your distribution. The `libaio-dev` library is not sufficient; you must have the `libaio` library. (Bug #11893055, Bug #60544)

- **InnoDB Storage Engine**: Raised the number of I/O requests that each AIO helper thread could process, from 32 to 256. The new limit applies to Linux and Unix platforms; the limit on Windows remains 32. (Bug #59472)

- **InnoDB Storage Engine**: `InnoDB` returned values for "rows examined" in the query plan that were higher than expected. `NULL` values were treated in an inconsistent way. The inaccurate statistics could trigger "false positives" in combination with the `max_join_size` setting, because the queries did not really examine as many rows as reported.

  A new configuration option `innodb_stats_method` lets you specify how `NULL` values are treated when calculating index statistics. Allowed values are `nulls_equal` (the default), `nulls_unequal` and `null_ignored`. The meanings of these values are similar to those of the `myisam_stats_method` option. (Bug #30423)

- **Replication**: When using the statement-based logging format, `INSERT ON DUPLICATE KEY UPDATE` and `INSERT IGNORE` statements affecting transactional tables that did not fail were not written to the binary log if they did not insert any rows. (With statement-based logging, all successful statements should be logged, whether they do or do not cause any rows to be changed.) (Bug #59338, Bug #11766266)

- **Replication**: Formerly, `STOP SLAVE` stopped the slave I/O thread first and then stopped the slave SQL thread; thus, it was possible for the I/O thread to stop after replicating only part of a transaction which the SQL thread was executing, in which case—if the transaction could not be rolled back safely—the SQL thread could hang.

  Now, `STOP SLAVE` stops the slave SQL thread first and then stops the I/O thread; this guarantees that the I/O thread can fetch any remaining events in the transaction that the SQL thread is executing, so that the SQL thread can finish the transaction if it cannot be rolled back safely. (Bug #58546, Bug #11765563)

- An `OUTER JOIN` query using `WHERE col_name IS NULL` could return an incorrect result. (Bug #58490, Bug #11765513)

- `--autocommit=ON` did not work (it set the global `autocommit` value to 0, not 1). (Bug #59432, Bug #11766339)

- The fix for Bug #25192 caused `load_defaults()` to add an argument separator to distinguish options loaded from option files from those provided on the command line, whether or not the application needed it. (Bug #57953, Bug #11765041)

  References: See also Bug #11746296.

- The `DEFAULT_CHARSET` and `DEFAULT_COLLATION` `CMake` options did not work. (Bug #58991, Bug #11765967)

- When `mysqladmin` was run with the `--sleep` and `--count` options, it went into an infinite loop executing the specified command. (Bug #58221, Bug #11765270)

- `DELETE` or `UPDATE` statements could fail if they used `DATE` or `DATETIME` values with a year, month, or day part of zero. (Bug #59173)

- In debug builds, `SUBSTRING_INDEX(FORMAT(...), FORMAT(...))` could cause a server crash. (Bug #58371, Bug #11765406)

- Outer joins on a unique key could return incorrect results. (Bug #57034, Bug #11764219)

- The `ESCAPE` clause for the `LIKE` operator permits only expressions that evaluate to a constant at execution time, but aggregate functions were not being rejected. (Bug #59149, Bug #11766110)

- Outer joins with an empty table could produce incorrect results. (Bug #58422, Bug #11765451)

- The server and client did not always properly negotiate authentication plugin names. (Bug #59453, Bug #11766356)

- `SHOW PRIVILEGES` did not display a row for the `PROXY` privilege. (Bug #59275, Bug #11766216)

- The `mysql` client went into an infinite loop if the standard input was a directory. (Bug #57450, Bug #11764598)

- The expression *`const1`* `BETWEEN` *`const2`* `AND` *`field`* was optimized incorrectly and produced incorrect results. (Bug #57030, Bug #11764215)

- A query of the following form returned an incorrect result, where the values for *`col_name`* in the result set were entirely replaced with `NULL` values:

  ```
  SELECT DISTINCT col_name ... ORDER BY col_name DESC;
  ```

  (Bug #59308, Bug #11766241)

- `SHOW PROFILE` could truncate source file names or fail to show function names. (Bug #59273, Bug #11766214)

- Memory leaks detected by Valgrind, some of which could cause incorrect query results, were corrected. (Bug #59110, Bug

#11766075)

- Some string-manipulating SQL functions use a shared string object intended to contain an immutable empty string. This object was used by the SQL function `SUBSTRING_INDEX()` to return an empty string when one argument was of the wrong data type. If the string object was then modified by the SQL function `INSERT()`, undefined behavior ensued. (Bug #58165, Bug #11765225)
- Some RPM installation scripts used a hardcoded value for the data directory, which could result in a failed installation for users who have a nonstandard data directory location. The same was true for other configuration values such as the PID file name. (Bug #56581, Bug #11763817)
- `DES_DECRYPT()` could crash if the argument was not produced by `DES_ENCRYPT()`. (Bug #59632, Bug #11766505)
- On FreeBSD and OpenBSD, the server incorrectly checked the range of the system date, causing legal values to be rejected. (Bug #55755, Bug #11763089)
- Parsing nested regular expressions could lead to recursion resulting in a stack overflow crash. (Bug #58026, Bug #11765099)
- Starting the server with the `--defaults-file=file_name` option, where the file name had no extension, caused a server crash. (Bug #58455, Bug #11765482)
- There was an erroneous restriction on file attributes for `LOAD DATA INFILE`. (Bug #59085, Bug #11766052)
- Setting the `optimizer_switch` system variable to an invalid value caused a server crash. (Bug #59894, Bug #11766719)
- Sorting using `ORDER BY AVG(DISTINCT decimal_col)` caused a server crash or incorrect results. (Bug #52123, Bug #11759784)
- When using `ExtractValue()` or `UpdateXML()`, if the XML to be read contained an incomplete XML comment, MySQL read beyond the end of the XML string when processing, leading to a crash of the server. (Bug #44332, Bug #11752979)
- `DATE_ADD()` and `DATE_SUB()` return a string if the first argument is a string, but incorrectly returned a binary string. Now they return a character string with a collation of `connection_collation`. (Bug #31384, Bug #11747221)

D.1.14. Changes in MySQL 5.5.9 (07 February 2011)

Functionality Added or Changed

- The `mysqladmin` and `mysqldump` clients now have `--default-auth` and `--plugin-dir` options for specifying which authentication plugin and plugin directory to use. (Bug #58139, Bug #11765201)
- `sql_priv.h` now includes an `OPTION_ALLOW_BATCH` flag for the `transaction_allow_batching` feature of MySQL Cluster. (Bug #57604)
- Boolean system variables can be enabled at run time by setting them to the value `ON` or `OFF`, but previously this did not work at server startup. Now at startup such variables can be enabled by setting them to `ON` or `TRUE`. Any other nonnumeric variable is interpreted as `OFF`. (Bug #46393 improves on this such that `ON`, `TRUE`, `OFF`, and `FALSE` are recognized, and other values are invalid.) (Bug #51631, Bug #11759326)

  References: See also Bug #11754743.
- In the audit plugin interface, the `MYSQL_AUDIT_CONNECTION_CLASS` event class was added, and the `MYSQL_AUDIT_GENERAL_STATUS` subclass was added to the `MYSQL_AUDIT_GENERAL_CLASS` event class. The new symbol definitions can be found in the `plugin_audit.h` header file.

Bugs Fixed

- **Security Fix**: Bug #57952 was fixed.
- **Performance**: **InnoDB Storage Engine**: `InnoDB` now uses the `PAUSE` instruction on all platforms where it is available. Previously, `InnoDB` used the `PAUSE` instruction only on Windows systems. (Bug #58666)
- **Performance**: Queries involving `InnoDB` tables in the `INFORMATION_SCHEMA` tables `TABLE_CONSTRAINTS`, `KEY_COLUMN_USAGE`, or `REFERENTIAL_CONSTRAINTS` were slower than necessary because statistics were rechecked more often than required, even more so when many foreign keys were present. The improvement to this may be of particular benefit to users of MySQL Enterprise Monitor with many monitored servers or tens of thousands of tables. (Bug #43818, Bug #11752585)

- **Incompatible Change**: When `auto_increment_increment` is greater than one, values generated by a bulk insert that reaches the maximum column value could wrap around rather producing an overflow error.

  As a consequence of the fix, it is no longer possible for an auto-generated value to be equal to the maximum `BIGINT UNSIGNED` value. It is still possible to store that value manually, if the column can accept it. (Bug #39828, Bug #11749800)

- **Important Change**: **Partitioning**: Date and time functions used as partitioning functions now have the types of their operands checked; use of a value of the wrong type is now disallowed in such cases. In addition, `EXTRACT(WEEK FROM col_name)`, where *`col_name`* is a `DATE` or `DATETIME` column, is now disallowed altogether because its return value depends on the value of the `default_week_format` system variable. (Bug #54483, Bug #11761948)

  References: See also Bug #57071, Bug #11764255.

- **Partitioning**: **InnoDB Storage Engine**: The partitioning handler did not pass locking information to a table's storage engine handler. This caused high contention and thus slower performance when working with partitioned `InnoDB` tables. (Bug #59013)

- **InnoDB Storage Engine**: The server could crash with an assertion error, if a stored procedure, stored function, or trigger modified one `InnoDB` table containing an auto-increment column, and dropped another `InnoDB` table containing an auto-increment column. (Bug #56228)

- **InnoDB Storage Engine**: In `InnoDB` status output, the value for `I/O sum[]` could be incorrect, displayed as a very large number. (Bug #57600)

- **InnoDB Storage Engine**: The command to create a debug build (`cmake -DWITH_DEBUG ...`) now automatically sets the `InnoDB` debugging flag `UNIV_DEBUG` on all platforms. Formerly, the `UNIV_DEBUG` flag might not be set for Windows platforms with Visual Studio and not on OS X with Xcode. (Bug #58279)

- **InnoDB Storage Engine**: When multiple `InnoDB` buffer pools were enabled, `SHOW ENGINE INNODB` statements displayed information about each one, but not summary information combining statistics for the entire buffer pool subsystem. Now, the aggregated information is displayed in the `BUFFER POOL AND MEMORY` section, and information about individual buffer pool instances is displayed in a new `INDIVIDUAL BUFFER POOL INFO` section. (Bug #58461)

- **InnoDB Storage Engine**: When the `lower_case_table_names` variable was set to 2, `InnoDB` could fail to restore a `mysqldump` dump of a table with foreign key constraints involving case-sensitive names. (Bug #55222)

- **InnoDB Storage Engine**: It was not possible to query the `information_schema.INNODB_TRX` table while other connections were running queries involving `BLOB` types. (Bug #55397, Bug #11762763)

- **InnoDB Storage Engine**: The `OPTIMIZE TABLE` statement reset the auto-increment counter for an `InnoDB` table. Now the auto-increment value is preserved across this operation. (Bug #18274)

- **Partitioning**: Failed `ALTER TABLE ... PARTITION` statements could cause memory leaks. (Bug #56380, Bug #11763641)

  References: See also Bug #46949, Bug #11755209, Bug #56996, Bug #11764187.

- **Partitioning**: Failed `ALTER TABLE ... TRUNCATE PARTITION` statements were written to the binary log. (Bug #58147)

- **Replication**: While an `INSERT DELAYED` statement with a single inserted value does not return any visible warnings, such a warning could be still written into the error log. (Bug #57666, Bug #11764793)

  References: See also Bug #49567.

- **Replication**: When closing a session that used temporary tables, binary logging could sometimes fail with a spurious `Failed to write the DROP statement for temporary tables to binary log`. (Bug #57288)

- **Replication**: Due to changes made in MySQL 5.5.3, settings made in the `binlog_cache_size` and `max_binlog_cache_size` server system variables affected both the binary log statement cache (also introduced in that version) and the binary log transactional cache (formerly known simply as the binary log cache). This meant that the resources used as a result of setting either or both of these variables were double the amount expected. To rectify this problem, these variables now affect only the transactional cache. The fix for this issue also introduces two new system variables `binlog_stmt_cache_size` and `max_binlog_stmt_cache_size`, which affect only the binary log statement cache.

  In addition, the `Binlog_cache_use` status variable was incremented whenever either cache was used, and `Binlog_cache_disk_use` was incremented whenever the disk space from either cache was used, which caused problems with performance tuning of the statement and transactional caches, because it was not possible to determine which of these was being exceeded when attempting to troubleshoot excessive disk seeks and related problems. This issue is solved by changing the behavior of these two status variables such that they are incremented only in response to usage of the binary log transactional cache, as well as by introducing two new status variables `Binlog_stmt_cache_use` and `Bin-`

`log_stmt_cache_disk_use`, which are incremented only by usage of the binary log statement cache.

The behavior of the `max_binlog_cache_size` system variable with regard to active sessions has also been changed to match that of the `binlog_cache_size` system variable: Previously, a change in `max_binlog_cache_size` took effect in existing sessions; now, as with a change in `binlog_cache_size`, a change in `max_binlog_cache_size` takes effect only in sessions begun after the value was changed.

For more information, see System variables used with the binary log, and Section 5.1.5, “Server Status Variables”. (Bug #57275, Bug #11764443)

- **Replication**: By default, a value is generated for an `AUTO_INCREMENT` column by inserting either `NULL` or 0 into the column. Setting the `NO_AUTO_VALUE_ON_ZERO` server SQL mode suppresses this behavior for 0, so that it occurs only when `NULL` is inserted into the column.

  This behavior is also followed on a replication slave (by the slave SQL thread) when applying events that have been logged on the master using the statement-based format. However, when applying events that had been logged using the row-based format, `NO_AUTO_VALUE_ON_ZERO` was ignored, which could lead to an assertion.

  To fix this issue, the value of an `AUTO_INCREMENT` column is no longer generated when applying an event that was logged using the row-based row format, as this value is already contained in the changes applied on the slave. (Bug #56662)

- **Replication**: The `Binlog_cache_use` and `Binlog_cache_disk_use status` variables were incremented twice by a change to a table using a transactional storage engine. (Bug #56343, Bug #11763611)

  References: This bug is a regression of Bug #50038.

- **Replication**: The `BINLOG` statement modified the values of session variables, which could lead to problems with operations such as point-in-time recovery. One such case occurred when replaying a row-based binary log which relied on setting `foreign_key_checks = OFF` at the session level to create and populate a set of `InnoDB` tables having foreign key constraints. (Bug #54903)

- **Replication**: `mysqlbinlog` printed `USE` statements to its output only when the default database changed between events. To illustrate how this could cause problems, suppose that a user issued the following sequence of statements:

```
CREATE DATABASE mydb;
USE mydb;
CREATE TABLE mytable (column_definitions);
DROP DATABASE mydb;
CREATE DATABASE mydb;
USE mydb;
CREATE TABLE mytable (column_definitions);
```

  When played back using `mysqlbinlog`, the second `CREATE TABLE` statement failed with `ERROR: NO DATABASE SELECTED` because the second `USE` statement was not played back, due to the fact that a database other than `mydb` was never selected.

  This fix ensures that `mysqlbinlog` outputs a `USE` statement whenever it reads one from the binary log. (Bug #50914, Bug #11758677)

- **Replication**: When an error occurred in the generation of the name for a new binary log file, the error was logged but not shown to the user. (Bug #46166)

  References: See also Bug #37148, Bug #11748696, Bug #40611, Bug #11750196, Bug #43929, Bug #51019.

- **Replication**: Previously, when a statement failed with a different error on the slave than on the master, the slave SQL thread displayed a message containing:

  - The error message for the master error code
  - The master error code
  - The error message for the slaves error code
  - The slave error code

  However, the slave has no information with which to fill in any print format specifiers for the master message, so it actually displayed the message format string. To make it clearer that the slave is not displaying the actual message as it appears on the master, the slave now indicates that the master part of the output is the message format, not the actual message. For example, previously the slave displayed information like this:

```
Error: "Query caused different errors on master and slave. Error
on master: 'Duplicate entry '%-.192s' for key %d' (1062), Error on
slave: 'no error' (0). Default database: 'test'. Query: 'insert
into t1 values(1),(2)'" (expected different error codes on master
and slave)
```

Now the slave displays this:

```
Error: "Query caused different errors on master and slave. Error
on master: message format='Duplicate entry '%-.192s' for key %d'
error code=1062 ; Error on slave: actual message='no error', error
code=0. Default database: 'test'. Query: 'insert into t1 values(1),(2)'"
(expected different error codes on master and slave)
```

(Bug #46697)

- A Valgrind failure occurred in `fn_format` when called from `archive_discover`. (Bug #58205, Bug #11765259)
- Issuing `EXPLAIN EXTENDED` for a query that would use condition pushdown could cause `mysqld` to crash. (Bug #58553, Bug #11765570)
- It was possible to compile `mysqld` with Performance Schema support but with a dummy atomic-operations implementation, which caused a server crash. This problem does not affect binary distributions. It is helpful as a safety measure for users who build MySQL from source. (Bug #56769)
- `CMake` polluted the source tree by writing installation-related temporary files there. (Bug #58372)
- `CMake` did not add `LINK_LIBRARIES` for `MYSQL_ADD_PLUGIN` for `libmysqld`. (Bug #58158)
- `CREATE DATABASE` and `DROP DATABASE` caused `mysql --one-database` to lose track of the statement-filtering context. (Bug #54899)
- Configuration with maintainer mode enabled resulted in errors when compiling with `icc`. (Bug #57991, Bug #58871)
- Configuring MySQL with `-DWITHOUT_PERFSCHEMA_STORAGE_ENGINE=1` caused build failures. (Bug #58953)
- Security context references in `sp_head.cc` were rewritten for improved DTrace compatibility. (Bug #58350)
- The `cp1251` character set did not properly support the Euro sign (`0x88`). For example, converting a string containing this character to `utf8` resulted in `'?'` rather than the `utf8` Euro sign. (Bug #56639)
- The `ucs2` character set does not support characters outside the Basic Multilingual Plane (BMP), but converting to `ucs2` a string containing such characters did not produce a conversion-failure warning. (Bug #58321)
- On Solaris, the MySQL build failed if it was configured with debugging enabled. (Bug #58699)
- Several Valgrind warnings were fixed. (Bug #58948, Bug #59021)
- View creation could produce Valgrind warnings. (Bug #57352)
- Some unsigned system variables could be displayed with negative values. (Bug #55794)
- The `BIT_AND()` function could return incorrect results when a join returned no matching rows. (Bug #57954)
- If MySQL was built with Visual Studio Express, the project wixca was not built. (Bug #58411)
- An assertion could be raised during concurrent execution of `DROP DATABASE` and `REPAIR TABLE` if the drop deleted a table's `.TMD` file at the same time the repair tried to read details from the old file that was just removed.

  A problem could also occur when `DROP TABLE` tried to remove all files belonging to a table at the same time `REPAIR TABLE` had just deleted the table's `.TMD` file. (Bug #54486)
- If the set of values aggregated with `AVG(DISTINCT)` contained a `NULL` value, the function result could be incorrect. (Bug #57932)
- `EXPLAIN` could crash for queries that used `GROUP_CONCAT()`. (Bug #58396)
- An assertion could be raised for queries for which the optimizer could choose between Index Merge range access or const ref access methods. (Bug #58456)
- Unnecessary subquery evaluation in contexts such as statement preparation or view creation could cause a server crash. (Bug #57703)
- An assertion could be raised if the server was closing a session at the same time the session was being killed by another thread. (Bug #58136)
- `EXPLAIN` could crash for queries that accessed two derived tables. (Bug #58730)

- In rare cases, `LIKE` expressions failed for an indexed column that used a collation containing contractions. (Bug #57737)
- An `ORDER BY` clause was bound to the incorrect substatement when used in `UNION` context. (Bug #57986)
- In a subquery, a `UNION` with no referenced tables (or only a reference to the `DUAL` virtual table) did not permit an `ORDER BY` clause. (Bug #58970, Bug #11765950)
- `MIN(year_col)` could return an incorrect result in some cases. (Bug #59211, Bug #11766165)
- Comparisons of aggregate values with `TIMESTAMP` values were incorrect. (Bug #59330, Bug #11766259)
- If `max_allowed_packet` was set larger than 16MB, the server failed to reject too-large packets with "Packet too large" errors. (Bug #58887, Bug #11765878)
- `OPTIMIZE TABLE` for an `InnoDB` table could raise an assertion if the operation failed because it had been killed. (Bug #58933, Bug #11765920)
- `NULL` geometry values could cause a crash in `Item_func_spatial_collection::fix_length_and_dec`. (Bug #57321)
- `mysqlslap` failed to check for a `NULL` return from `mysql_store_result()` and crashed trying to process the result set. (Bug #59109, Bug #11766074)
- For `DIV` expressions, assignment of the result to multiple variables could cause a server crash. (Bug #59241, Bug #11766191)

  References: See also Bug #8457.
- A `NOT IN` predicate with a subquery containing a `HAVING` clause could retrieve too many rows, when the subquery itself returned `NULL`. (Bug #58818, Bug #11765815)
- Condition pushdown optimization could push down conditions with incorrect column references. (Bug #58134, Bug #11765196)
- If a client supplied a user name longer than the maximum 16 characters permitted for names stored in the MySQL grant tables, all characters were being considered significant when checking for a match. Historically, only the first 16 characters were used for matching; this behavior was restored. (Bug #49752)
- An assertion could be raised if –1 was inserted into an `AUTO_INCREMENT` column by a statement writing more than one row. (Bug #50619, Bug #11758417)
- When `mysqld` printed crash dump information, it incorrectly indicated that some valid pointers were invalid. (Bug #51817)
- On FreeBSD, if `mysqld` was killed with a `SIGHUP` signal, it could corrupt `InnoDB .ibd` files. (Bug #51023, Bug #11758773)
- The `my_seek()` and `my_tell()` functions ignored the `MY_WME` flag when they returned an error, which could cause client programs to hang. (Bug #48451)
- After compilation from source, all header files were installed in the same directory, even those that should be installed into subdirectories of the installation include directory. (Bug #51925)
- On Mac OS X, a configuration error caused the preference pane to fail. (Bug #51264)
- During assignment of values to system variables, legality checks on the value range occurred too late, preventing proper error checking. (Bug #43233)
- On Solaris, time-related functions such as `NOW()` or `SYSDATE()` could return a constant value. (Bug #42054)
- If the remote server for a `FEDERATED` table could not be accessed, queries for the `INFORMATION_SCHEMA.TABLES` table failed. (Bug #35333)

D.1.15. Changes in MySQL 5.5.8 (03 December 2010, General Availability)

Configuration Notes

- MySQL releases are now built on all platforms using `CMake` rather than the GNU autotools, so autotools support has been removed. For instructions on building MySQL with `CMake`, see Section 2.9, "Installing MySQL from Source". If you are familiar with autotools but not `CMake`, you might find this transition document helpful: http://forge.mysql.com/wiki/Autotools_to_CMake_Transition_Guide Third-party tools that need to extract the MySQL version

number formerly found in `configure.in` can use the `VERSION` file. See Section 2.9.6, "MySQL Configuration and Third-Party Tools".

Functionality Added or Changed

- Support for the `IBMDB2I` storage engine has been removed. (Bug #58079)
- For an upgrade to MySQL 5.5.7 from a previous release, the server exited if the `mysql.proxies_priv` table did not exist, making upgrades inconvenient. Now the server treats a missing `proxies_priv` table as equivalent to an empty table. However, after starting the server, you should still run `mysql_upgrade` to create the table. (Bug #57551)
- The client/server protocol now includes a `SERVER_QUERY_WAS_SLOW` flag to indicate when a query is slow; that is, when query execution exceeds the value of the `long_query_time` system variable. (Bug #57058)
- The following words are no longer reserved words the way they are in earlier MySQL 5.5 releases: `SLOW`, `GENERAL`, `IGNORE_SERVER_IDS`, `MASTER_HEARTBEAT_PERIOD` (Bug #57899)
- The `autocommit` system variable is enabled by default for all user connections, and the session value can be set for each new connection by setting the `init_connect` system variable to `SET autocommit=0`. However, this has no effect for users who have the `SUPER` privilege.

  Now the global `autocommit` value can be set at server startup, and this value is used to initialize the session value for all new connections, including those for users with the `SUPER` privilege. The variable is treated as a boolean value so it can be enabled with `--autocommit`, `--autocommit=1`, or `--enable-autocommit`. It can be disabled with `--autocommit=0`, `--skip-autocommit`, or `--disable-autocommit`. (Bug #57316)
- The time zone tables available at http://dev.mysql.com/downloads/timezones.html have been updated. These tables can be used on systems such as Windows or HP-UX that do not include zoneinfo files. (Bug #40230)
- A `--bind-address` option has been added to a number of MySQL client programs: `mysql`, `mysqldump`, `mysqladmin`, `mysqlbinlog`, `mysqlcheck`, `mysqlimport`, and `mysqlshow`. This is for use on a computer having multiple network interfaces, and enables you to choose which interface is used to connect to the MySQL server.

  A corresponding change was made to the `mysql_options()` C API function, which now has a `MYSQL_OPT_BIND` option for specifying the interface. The argument is a host name or IP address (specified as a string).
- Changes to replication in MySQL 5.6 make `mysqlbinlog` output generated by the `--base64-output=ALWAYS` option unusable, so `ALWAYS` is now deprecated and will be an invalid option value in MySQL 5.6. This should not be a significant problem because `--base64-output` values other than `AUTO` are supposed to be used only for debugging, not for production environments.

  References: See also Bug #28760.

Bugs Fixed

- **InnoDB Storage Engine**: **Security Fix**: A failed `CREATE TABLE` statement for an `InnoDB` table could allocate memory that was never freed. (Bug #56947)
- **Security Fix**: Bug #55146 and Bug #56287 were fixed.
- **Security Fix**: Bug #56814 was fixed.
- **Security Fix**: Bug #54484 was fixed.
- **Security Fix**: Bug #57130 was fixed.
- **Security Fix**: Bug #57272 was fixed.
- **Security Fix**: Bug #57477 was fixed.
- **Security Fix**: Bug #57687 was fixed.
- **Security Fix**: Bug #57659 was fixed.
- **Security Fix**: Bug #58005 was fixed.
- **Performance**: **InnoDB Storage Engine**: Improved concurrency when several `ANALYZE TABLE` or `SHOW TABLE STATUS` statements are run simultaneously for `InnoDB` tables. (Bug #53046)

- **Incompatible Change**: The following changes were made to the `performance_schema.threads` table for conformance with the implementation in MySQL 5.6:

  - `ID` column: Renamed to `PROCESSLIST_ID`, removed `NOT NULL` from definition.
  - `NAME` column: Changed from `VARCHAR(64)` to `VARCHAR(128)`.

  (Bug #57154)

- **Incompatible Change**: Previously, tables in the `performance_schema` database had uppercase names. This was incompatible with the `lower_case_table_names` system variable, and caused issues when the variable value was changed *after* installing or upgrading.

  Now `performance_schema` table names are lowercase, so they appear in uniform lettercase regardless of the `lower_case_table_names` setting. References to these tables in SQL statements should be given in lowercase. This is an incompatible change, but provides compatible behavior across different values of `lower_case_table_names`.

  If you upgrade to MySQL 5.5.8 from an earlier version of MySQL 5.5, be sure to run `mysql_upgrade` (and restart the server) to change the names of existing `performance_schema` tables from uppercase to lowercase. If `mysql_upgrade` does not work, use this procedure:

  1. Stop `mysqld`.
  2. Remove the `performance_schema/*.frm` files from the data directory.
  3. Create a separate "dummy" MySQL 5.5.8 installation.
  4. Copy the `performance_schema/*.frm` files from the dummy installation to the installation you are upgrading.
  5. Restart `mysqld` and run `mysqld_upgrade --force` and check that it does not produce errors.
  6. Remove the dummy installation.

  (Bug #57609)

- **Incompatible Change**: Starvation of `FLUSH TABLES WITH READ LOCK` statements occurred when there was a constant load of concurrent DML statements in two or more connections. Deadlock occurred when a connection that had some table open through a `HANDLER` statement tried to update data through a DML statement while another connection tried to execute `FLUSH TABLES WITH READ LOCK` concurrently.

  These problems resulted from the global read lock implementation, which was reimplemented with the following consequences:

  - To solve deadlock in event-handling code that was exposed by this patch, the `LOCK_event_metadata` mutex was replaced with metadata locks on events. As a result, DDL operations on events are now prohibited under `LOCK TABLES`. This is an incompatible change.
  - The global read lock (`FLUSH TABLES WITH READ LOCK`) no longer blocks DML and DDL on temporary tables. Before this patch, server behavior was not consistent in this respect: In some cases, DML/DDL statements on temporary tables were blocked; in others, they were not. Since the main use cases for `FLUSH TABLES WITH READ LOCK` are various forms of backups and temporary tables are not preserved during backups, the server now consistently permits DML/DDL on temporary tables under the global read lock.
  - The set of thread states has changed:
    - `Waiting for global metadata lock` is replaced by `Waiting for global read lock`.
    - Previously, `Waiting for release of readlock` was used to indicate that DML/DDL statements were waiting for release of a read lock and `Waiting to get readlock` was used to indicate that `FLUSH TABLES WITH READ LOCK` was waiting to acquire a global read lock. Now `Waiting for global read lock` is used for both cases.
    - Previously, `Waiting for release of readlock` was used for all statements that caused an explicit or implicit commit to indicate that they were waiting for release of a read lock and `Waiting for all running commits to finish` was used by `FLUSH TABLES WITH READ LOCK`. Now `Waiting for commit lock` is used for both cases.
    - There are two other new states, `Waiting for trigger metadata lock` and `Waiting for event metadata lock`.

  (Bug #57006, Bug #11764195, Bug #54673, Bug #11762116)

- **InnoDB Storage Engine**: If the MySQL Server crashed immediately after creating an `InnoDB` table, the server could quit with a `signal 11` during the subsequent restart. The issue could occur if the server halted after `InnoDB` created the primary index for the table, but before the index definition was recorded in the MySQL metadata. (Bug #57616)

  References: This bug is a regression of Bug #54582.

- **InnoDB Storage Engine**: The `InnoDB` system tablespace could grow continually for a server under heavy load. (Bug #57611)

- **InnoDB Storage Engine**: Values could be truncated in certain `INFORMATION_SCHEMA` columns, such as `REFERENTIAL_CONSTRAINTS.REFERENCED_TABLE_NAME` and `KEY_COLUMN_USAGE.REFERENCED_TABLE_NAME`. (Bug #57960)

- **InnoDB Storage Engine**: A followup fix to bug #54678. `TRUNCATE TABLE` could still cause a crash (assertion error) in the debug version of the server. (Bug #57700)

- **InnoDB Storage Engine**: A large number of foreign key declarations could cause the output of the `SHOW CREATE STATEMENT` statement to be truncated. (Bug #56143)

- **InnoDB Storage Engine**: For an `InnoDB` table created with `ROW_FORMAT=COMPRESSED` or `ROW_FORMAT=DYNAMIC`, a query using the `READ UNCOMMITTED` isolation level could cause the server to stop with an assertion error, if `BLOB` or other large columns that use off-page storage were being inserted at the same time. (Bug #57799)

- **InnoDB Storage Engine**: Heavy concurrent updates of a `BLOB` column in an `InnoDB` table could cause a hang. (Bug #57579)

- **InnoDB Storage Engine**: An existing `InnoDB` table could be switched to `ROW_FORMAT=COMPRESSED` implicitly by a `KEY_BLOCK_SIZE` clause in an `ALTER TABLE` statement. Now, the row format is only switched to compressed if there is an explicit `ROW_FORMAT=COMPRESSED` clause. on the `ALTER TABLE` statement.

  Any valid, nondefault `ROW_FORMAT` parameter takes precedence over `KEY_BLOCK_SIZE` when both are specified. `KEY_BLOCK_SIZE` only enables `ROW_FORMAT=COMPRESSED` if `ROW_FORMAT` is not specified on either the `CREATE TABLE` or `ALTER TABLE` statement, or is specified as `DEFAULT`. In case of a conflict between `KEY_BLOCK_SIZE` and `ROW_FORMAT` clauses, the `KEY_BLOCK_SIZE` is ignored if `innodb_strict_mode` is off, and the statement causes an error if `innodb_strict_mode` is on. (Bug #56632)

- **InnoDB Storage Engine**: The clause `KEY_BLOCK_SIZE=0` is now permitted on `CREATE TABLE` and `ALTER TABLE` statements for `InnoDB` tables, regardless of the setting of `innodb_strict_mode`. The zero value has the effect of resetting the `KEY_BLOCK_SIZE` table parameter to its default value, depending on the `ROW_FORMAT` parameter, as if it had not been specified. That default is 8 if `ROW_FORMAT=COMPRESSED`. Otherwise, `KEY_BLOCK_SIZE` is not used or stored with the table parameters.

  As a consequence of this fix, `ROW_FORMAT=FIXED` is not permitted when `innodb_strict_mode` is enabled. (Bug #56628)

- **InnoDB Storage Engine**: Turning off the `innodb_stats_on_metadata` option could prevent the `ANALYZE TABLE` statement from updating the cardinality statistics of `InnoDB` tables. (Bug #57252)

- **InnoDB Storage Engine**: The server could stop with an assertion error on Windows Vista and Windows 7 systems. (Bug #57720)

- **InnoDB Storage Engine**: A query for an `InnoDB` table could return the wrong value if a column value was changed to a different case, and the column had a case-insensitive index. (Bug #56680)

- **InnoDB Storage Engine**: Clarified the message when a `CREATE TABLE` statement fails because a foreign key constraint does not have the required indexes. (Bug #16290)

- **Partitioning**: In debug builds, an `INSERT ... ON DUPLICATE KEY UPDATE col_name = 0` statement on an `AUTO_INCREMENT` column caused the server to crash. (Bug #57890)

- **Partitioning**: Issuing `ALTER TABLE ... ADD PRIMARY KEY` on a partitioned `InnoDB` table could cause the MySQL Server to crash. (Bug #57778)

- **Partitioning**: In-place `ALTER TABLE` operations (that do not involve a table copy) on a partitioned table could leave the table in an unusable state. (Bug #57985)

- **Replication**: Concurrent statements using a stored function and a `DROP DATABASE` statement that caused the same stored function to be dropped could cause statement-based replication to fail. This problem is resolved by making sure that `DROP DATABASE` takes an exclusive metadata lock on all stored functions and stored procedures that it causes to be dropped. (Bug #57663)

  References: See also Bug #30977.

- **Replication**: If there exist both a temporary table and a nontemporary table having the same name, updates normally apply only to the temporary table, with the exception of a `CREATE TABLE ... SELECT` statement that creates a nontemporary table having the same name as an existing temporary table. When such a statement was replicated using the `MIXED` logging format, and the statement was unsafe for row-based logging, updates were misapplied to the temporary table.

  Updates were also applied wrongly when a temporary table that used a transactional storage engine was dropped inside a transaction, followed by updates within the same transaction to a nontemporary table having the same name. (Bug #55478)

  References: See also Bug #47899, Bug #55709.

- **Replication**: When `STOP SLAVE` is issued, the slave SQL thread rolls back the current transaction and stops immediately if the transaction updates only tables which use transactional storage engines. Previously, this occurred even when the transaction contained `CREATE TEMPORARY TABLE` statements, `DROP TEMPORARY TABLE` statements, or both, although these statements cannot be rolled back. Because temporary tables persist for the lifetime of a user session (in the case, the replication user), they remain until the slave is stopped or reset. When the transaction is restarted following a subsequent `START SLAVE` statement, the SQL thread aborts with an error that a temporary table to be created (or dropped) already exists (or does not exist, in the latter case).

  Following this fix, if an ongoing transaction contains `CREATE TEMPORARY TABLE` statements, `DROP TEMPORARY TABLE` statements, or both, the SQL thread now waits until the transaction ends, then stops. (Bug #56118, Bug #11763416)

- **Replication**: When making changes to relay log settings using `CHANGE MASTER TO`, the I/O cache was not cleared. This could result in replication failure when the slave attempted to read stale data from the cache and then stopped with an assertion. (Bug #55263)

- **Replication**: Replication of `SET` and `ENUM` columns represented using more than 1 byte (that is, `SET` columns with more than 8 members and `ENUM` columns with more than 256 constants) between platforms using different endianness failed when using the row-based format. This was because columns of these types are represented internally using integers, but the internal functions used by MySQL to handle them treated them as strings. (Bug #52131)

  References: See also Bug #53528.

- **Replication**: Trying to read from a binary log containing a log event of an invalid type caused the slave to crash. (Bug #38718)

- **Replication**: When replicating the `mysql.tables_priv` table, the `Grantor` column was not replicated, and was thus left empty on the slave. (Bug #27606)

- Passing a string that was not null-terminated to `UpdateXML()` or `ExtractValue()` caused the server to fail with an assertion. (Bug #57279, Bug #11764447)

- The server could crash inside `memcpy()` when reading certain Performance Schema tables. (Bug #56761, Bug #58003)

- Warnings raised by a trigger were not cleared upon successful completion. Now warnings are cleared if the trigger completes successfully, per the SQL standard. (Bug #55850)

- A user with no privileges on a stored routine or the `mysql.proc` table could discover the routine's existence. (Bug #57061)

- Several compilation problems were fixed. (Bug #57992, Bug #57993, Bug #57994, Bug #57995, Bug #57996, Bug #57997, Bug #58057)

- Clients using a client library older than MySQL 5.5.7 suffered loss of connection after executing `mysql_change_user()` while connected to a 5.5.7 server. (Bug #57689)

- If a `STOP SLAVE` statement was issued while the slave SQL thread was executing a statement that invoked the `SLEEP()` function, both statements hung. (Bug #56096)

- For `CMake` builds, some parts of the source were unnecessarily compiled twice if the embedded server was built. (Bug #55647)

- `OPTIMIZE TABLE` for `InnoDB` tables could raise an assertion. (Bug #55930)

- Boolean command options caused an error if given with an option value and the `loose-` option prefix. (Bug #54569)

- The server could crash as a result of accessing freed memory when populating `INFORMATION_SCHEMA.VIEWS` if a view could not be opened properly. (Bug #56540)

- `SET GLOBAL debug` could cause a crash on Solaris if the server failed to open the trace file. (Bug #57274)

- Setting the `read_only` system variable at server startup did not work. (Bug #58669)

- `mysql_upgrade` failed after an upgrade from MySQL 5.1. (Bug #58514)

- The Performance Schema did not count I/O for the binary log file. (Bug #58052)
- `BETWEEN` did not use indexes for `DATE` or `DATETIME` columns. (Bug #58190)
- `SHOW PROCESSLIST` displayed non-ASCII characters improperly. (Bug #57306)
- In debug builds, a missing `DBUG_RETURN` macro in `sql/client.c` caused `mysql` to be unable to connect to the server. (Bug #57744)
- In debug builds, an assertion could be raised during conversion of strings to floating-point values. (Bug #57203)
- When configuring the build with `-DBUILD_CONFIG=mysql_release` and building with Visual Studio Express, the build failed if `signtool.exe` was not present. (Bug #58313)
- When configuring the build with `-DBUILD_CONFIG=mysql_release` on Linux, `libaio` is required, but the error message if it was missing was uninformative. (Bug #58227)
- Incorrect error handling raised an assertion if character set conversion wrapped an item that failed. (Bug #57882)
- In debug builds, inserting a `FLOAT` value into a `CHAR(0)` column could cause a server crash. (Bug #58137)
- Queries executed using the Index Merge access method and a temporary file could return incorrect results. (Bug #56862)
- After creation of a table with two foreign key constraints, the `INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS` table displayed only one of them. (Bug #57904)
- An error in a stored procedure could leave the session in a different default database. (Bug #54375)
- Failure to create a thread to handle a user connection could cause a server crash. (Bug #58080)
- Memory was allocated in `fn_expand()` for storing path names, but not freed anywhere. (Bug #58173)
- Valgrind warnings about overlapping memory when double-assigning the same variable were corrected. (Bug #56138)
- Use of `NAME_CONST()` in a `HAVING` clause caused a server crash. (Bug #58199)
- During configuration, `ADD_VERSION_INFO` in `cmake/mysql_version.cmake` failed if `LINK_FLAGS` was modified. (Bug #58074)
- The `MySQL-shared` RPM package failed to provide the lowercase virtual identifier `'mysql-shared'` in the RPM `'Provides'` tags (usually used for backward compatibility). (Bug #57596)
- If the *`file_name`* argument to the `--defaults-file` or `--defaults-extra-file` option was not a full path name, it could be interpreted incorrectly in some contexts and cause a server crash. Now the *`file_name`* argument is interpreted as relative to the current working directory if given as a relative path name rather than as a full path name. (Bug #57108)
- With `CMake` 2.8.3, the `-DBUILD_CONFIG=mysql_release` option did not work. (Bug #58272)
- In debug builds, an assertion could be raised if a `send_eof()` method was called after an error occurred. (Bug #54812)
- The `find_files()` function used by `SHOW` statements performed redundant and unnecessary memory allocation. (Bug #51208)
- On file systems with case insensitive file names, and `lower_case_table_names=2`, the server could crash due to a table definition cache inconsistency. (Bug #46941)
- The `CMake` "wrapper" for `configure` (`configure.pl`) did not handle the `--with-comment` option properly. (Bug #52275)
- Grouping by a `TIME_TO_SEC()` function result could cause a server crash or incorrect results. Grouping by a function returning a `BLOB` could cause an unexpected "Duplicate entry" error and incorrect result. (Bug #52160)
- The Windows sample option files contained values more appropriate for Linux. (Bug #50021)
- A failed `RENAME TABLE` operation could prevent a `FLUSH TABLES WITH READ LOCK` from completing. (Bug #47924)
- Error messages for several delegate-related initialization error conditions that should not occur were changed to help identify the area of failure and to instruct the user to file a bug report if they do occur. A delegate is a set of internal data structures and algorithms. (Bug #47027)
- Handling of host name lettercase in `GRANT` statements was inconsistent. (Bug #36742)

- `SET NAMES utf8 COLLATE utf8_sinhala_ci` did not work. (Bug #26474)
- The `utf16_bin` collation uses code-point order, not byte-by-byte order, as described at Section 9.1.14.1, “Unicode Character Sets”. (The order was byte-by-byte in MySQL 5.5.7.)

D.1.16. Changes in MySQL 5.5.7 (14 October 2010)

Authentication Changes

- MySQL now supports pluggable authentication, such that the server uses plugins to authenticate incoming client connections. Client programs load an authentication plugin that interacts properly with the corresponding server plugin.

  Pluggable authentication enables two important capabilities, external authentication and proxy users:

  - Pluggable authentication makes it possible for clients to connect to the MySQL server with credentials that are appropriate for authentication methods other than native authentication based on passwords stored in the `mysql.user` table. For example, plugins can be created to use external authentication methods such as PAM, Windows login IDs, LDAP, or Kerberos.
  - If a user is permitted to connect, an authentication plugin can return to the server a user name different from the name of the connecting user, to indicate that the connecting user is a proxy for another user. While the connection lasts, the proxy user is treated, for purposes of access control, as having the privileges of a different user. In effect, one user impersonates another.

  Pluggable authentication entails these changes:

  - For user specifications in the `CREATE USER` and `GRANT` statements, there is a new `IDENTIFIED WITH` clause for specifying the authentication plugin.
  - For the `mysql.user` table, there are new columns that specify plugin information. The `plugin` column, if nonempty, indicates which plugin authenticates connections for an account. The `authentication_string` column is a string that the server passes to the plugin for connections by clients that authenticate using the plugin.
  - For the `mysql_options()` C API function, there are new `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options that enable client programs to load authentication plugins.
  - For the `mysql` client, there are new `--default-auth` and `--plugin-dir` options for specifying which authentication plugin and plugin directory to use. These options will be added to other clients in future releases.
  - For the `mysqltest` client, there is a new `--plugin-dir` option for specifying which plugin directory to use, and a new `connect()` command argument to specify an authentication plugin.
  - For the server plugin API, there is a new `MYSQL_AUTHENTICATION_PLUGIN` plugin type.
  - A new client plugin API enables client programs to manage plugins.
  - The native authentication methods previously supported in MySQL have been reimplemented as plugins. These methods provide against the current password format and pre-MySQL 4.1.1 format that uses shorter password hash values. This change reimplements the native methods as plugins that cannot be unloaded. Existing clients authenticate as before with no changes needed. In particular, starting the server with the `--secure-auth` option still prevents clients that have pre-4.1.1 password hashes from connecting, and `--skip-grant-tables` still disables all password checking.

  Proxy user capability entails these changes:

  - There is a new `PROXY` privilege that can be managed with the `GRANT` and `REVOKE` statements.
  - The new `proxy_user` and `external_user` system variables indicate whether the current session uses proxying.
  - A new `mysql.proxies_priv` grant table records proxy information for MySQL accounts.

  Due to these changes, the server requires that a new grant table, `proxies_priv`, be present in the `mysql` database. If you are upgrading to MySQL 5.5.7 from a previous MySQL release rather than performing a new installation, the server will find that this table is missing and exit during startup with the following message:

  ```
  Table 'mysql.proxies_priv' doesn't exist
  ```

  To create the `proxies_priv` table, start the server with the `--skip-grant-tables` option to cause it to skip the normal grant table checks, then run `mysql_upgrade`. For example:

  ```
  shell> mysqld --skip-grant-tables &
  ```

```
shell> mysql_upgrade
```

Then stop the server and restart it normally.

You can specify other options on the `mysqld` command line if necessary. Alternatively, if your installation is configured so that the server normally reads options from an option file, use the `--defaults-file` option to specify the file (enter each command on a single line):

```
shell> mysqld --defaults-file=/usr/local/mysql/etc/my.cnf
         --skip-grant-tables &
shell> mysql_upgrade
```

With the `--skip-grant-tables` option, the server does no password or privilege checking, so any client can connect and effectively have all privileges. For additional security, use the `--skip-networking` option as well to prevent remote clients from connecting.

> **Note**
>
> The upgrade problem just described is fixed in MySQL 5.5.8. The server treats a missing `proxies_priv` table as equivalent to an empty table.

For additional information, consult these references:

- Information about pluggable authentication, including installation and usage instructions: Section 5.5.6, “Pluggable Authentication”.
- Information about proxy users: Section 5.5.7, “Proxy Users”.
- Information about the server and client plugin API: Section 22.2.4, “Writing Plugins”.
- Information about the C API functions for managing client plugins: See Section 21.9.10, “C API Client Plugin Functions”.
- Information about current restrictions on the use of pluggable authentication, including which connectors support which plugins: See Section E.9, “Restrictions on Pluggable Authentication”. Third-party connector developers should read that section to determine the extent to which a connector can take advantage of pluggable authentication capabilities and what steps to take to become more compliant.

Configuration Notes

- MySQL releases now are built using `CMake` rather than the GNU autotools. Accordingly, the instructions for installing MySQL from source have been updated to discuss how to build MySQL using `CMake`. See Section 2.9, “Installing MySQL from Source”. If you are familiar with autotools but not `CMake`, you might find this transition document helpful: http://forge.mysql.com/wiki/Autotools_to_CMake_Transition_Guide

  The build process is now similar enough on all platforms, including Windows, that there are no longer sections dedicated to notes for specific platforms.

  The default installation layout when compiling from source now matches that used for binary distributions. You will notice these differences for installations from source distributions:

  - `mysqld` is installed in `bin`, not `libexec`.
  - `mysql_install_db` is installed in `scripts`, not `bin`.
  - The data directory is `data`, not `var`.

  The `make_binary_distribution` and `make_win_bin_dist` scripts are now obsolete. To create a binary distribution, use `make package`.

Functionality Added or Changed

- **Incompatible Change**: Previously, if you flushed the logs using `FLUSH LOGS` or `mysqladmin flush-logs` and `mysqld` was writing the error log to a file (for example, if it was started with the `--log-error` option), it renamed the current log file with the suffix `-old`, then created a new empty log file. This had the problem that a second log-flushing operation thus caused the original error log file to be lost unless you saved it under a different name. For example, you could use the following commands to save the file:

```
shell> mysqladmin flush-logs
shell> mv host_name.err-old backup-directory
```

To avoid the preceding file-loss problem, renaming no longer occurs. The server merely closes and reopens the log file. To rename the file, you can do so manually before flushing. Then flushing the logs reopens a new file with the original file name. For example, you can rename the file and create a new one using the following commands:

```
shell> mv host_name.err host_name.err-old
shell> mysqladmin flush-logs
shell> mv host_name.err-old backup-directory
```

(Bug #29751)

References: See also Bug #56821.

- The unused and undocumented `thread_pool_size` system variable was removed. (Bug #57338)
- Added a new `SHOW PROCESSLIST` state, `Waiting for query cache lock`. This indicates that a session is waiting to take the query cache lock while it performs some query cache operation. (Bug #56822)
- The `pstack` library was nonfunctional and has been removed, along with the `--with-pstack` option for `configure` and the `--enable-pstack` option for `mysqld`. (Bug #57210)
- A new status variable, `Handler_read_last`, displays the number of requests to read the last key in an index. With `ORDER BY`, the server issues a first-key request followed by several next-key requests, whereas with `ORDER BY DESC`, the server issues a last-key request followed by several previous-key requests. (Bug #52312)
- Previously, the server supported values of `OFF`, `ON`, and `FORCE` for the `--plugin_name=value` option format for controlling plugin loading using an option named after the plugin. Such options now support a `FORCE_PLUS_PERMANENT` value. This value is like `FORCE`, but in addition prevents the plugin from being unloaded at runtime. If a user attempts to do so with `UNINSTALL PLUGIN`, an error occurs. See Section 5.1.7.1, “Installing and Uninstalling Plugins”.

  In addition, the `INFORMATION_SCHEMA.PLUGINS` table now has a `LOAD_OPTION` column that indicates the plugin loading value (`OFF`, `ON`, `FORCE`, or `FORCE_PLUS_PERMANENT`). See Section 19.14, “The `INFORMATION_SCHEMA PLUGINS` Table”.

Bugs Fixed

- **InnoDB Storage Engine**: **Incompatible Change**: **Security Fix**: Issuing `TRUNCATE TABLE` and examining the same table's information in the `INFORMATION_SCHEMA` database at the same time could cause a crash in the debug version of the server.

  As a result of this change, `InnoDB` always uses the fast truncation technique, equivalent to `DROP TABLE` and `CREATE TABLE`. It no longer performs a row-by-row delete for tables with parent-child foreign key relationships. `TRUNCATE TABLE` returns an error for such tables. Modify your SQL to issue `DELETE FROM table_name` for such tables instead. (Bug #54678)
- **Security Fix**: In prepared-statement mode, `EXPLAIN` for a `SELECT` from a derived table caused a server crash. (Bug #54488)
- **Security Fix**: The `CONVERT_TZ()` function crashed the server when the timezone argument was an empty `SET` column value. (Bug #55424)
- **Security Fix**: `EXPLAIN EXTENDED` caused a server crash with some prepared statements. (Bug #54494)
- **Security Fix**: The server crashed for assignment of values of types other than `Geometry` to items of type `GeometryCollection` (`MultiPoint`, `MultiCurve`, `MultiSurface`). Now the server checks the value type and fails with `bad geometry value` if it detects incorrect parameters. (Bug #55531)
- **Security Fix**: The `PolyFromWKB()` function could crash the server when improper WKB data was passed to the function. (Bug #51875, Bug #11759554, CVE-2010-3840)
- **Performance**: **InnoDB Storage Engine**: The master `InnoDB` background thread could sometimes cause transient performance drops due to excessive flushing of modified pages. (Bug #56933)
- **Incompatible Change**: **Replication**: The behavior of `INSERT DELAYED` statements when using statement-based replication has changed as follows:

  Previously, when using `binlog_format=STATEMENT`, a warning was issued in the client when executing `INSERT DELAYED`; now, no warning is issued in such cases.

Previously, when using `binlog_format=STATEMENT`, `INSERT DELAYED` was logged as `INSERT DELAYED`; now, it is logged as an `INSERT`, without the `DELAYED` option.

However, when `binlog_format=STATEMENT`, `INSERT DELAYED` continues to be executed as `INSERT` (without the `DELAYED` option). The behavior of `INSERT DELAYED` remains unchanged when using `binlog_format=ROW`: `INSERT DELAYED` generates no warnings, is executed as `INSERT DELAYED`, and is logged using the row-based format.

This change also affects `binlog_format=MIXED`, because `INSERT DELAYED` is no longer considered unsafe. Now, when the logging format is `MIXED`, no switch to row-based logging occurs. This means that the statement is logged as a simple `INSERT` (that is, without the `DELAYED` option), using the statement-based logging format. (Bug #54579, Bug #11762035)

References: See also Bug #56678, Bug #11763907, Bug #57666. This bug was introduced by Bug #39934, Bug #11749859.

- **Incompatible Change**: `HANDLER ... READ` statements that invoke stored functions can cause replication errors. Such statements are now disallowed and result in an `ER_NOT_SUPPORTED_YET` error. (Bug #54920)

- **Important Change**: **InnoDB Storage Engine**: The server could crash with an assertion, possibly leading to data corruption, while updating the primary key of an `InnoDB` table containing `BLOB` or other columns requiring off-page storage. This fix applies to the `InnoDB` Plugin in MySQL 5.1, and to `InnoDB` 1.1 in MySQL 5.5. (Bug #55543)

- **InnoDB Storage Engine**: **Replication**: If the master had `innodb_file_per_table=OFF`, `innodb_file_format=Antelope` (and `innodb_strict_mode=OFF`), or both, certain `CREATE TABLE` options, such as `KEY_BLOCK_SIZE`, were ignored. This could permit the master to avoid raising `ER_TOO_BIG_ROWSIZE` errors.

  However, the ignored `CREATE TABLE` options were still written into the binary log, so that, if the slave had `innodb_file_per_table=ON` and `innodb_file_format=Barracuda`, it could encounter an `ER_TOO_BIG_ROWSIZE` error while executing the record from the log, causing the slave SQL thread to abort and replication to fail.

  In the case where the master was running MySQL 5.1 and the slave was MySQL 5.5 (or later), the failure occurred when both master and slave were running with default values for `innodb_file_per_table` and `innodb_file_format`. This could cause problems during upgrades.

  To address this issue, the default values for `innodb_file_per_table` and `innodb_file_format` are reverted to the MySQL 5.1 default values—that is, `OFF` and `Antelope`, respectively. (Bug #56318, Bug #11763590)

- **InnoDB Storage Engine**: If the server crashed during a `RENAME TABLE` operation on an `InnoDB` table, subsequent crash recovery could fail. This problem could also affect an `ALTER TABLE` statement that caused a rename operation internally. (Bug #55027)

- **InnoDB Storage Engine**: The output from the `SHOW ENGINE INNODB STATUS` command can now be up to 1MB. Formerly, it was truncated at 64KB. Monitoring applications that parse that output can check whether it exceeds this new, larger limit by testing the `Innodb_truncated_status_writes` status variable. (Bug #56922)

- **InnoDB Storage Engine**: Changed the locking mechanism for the `InnoDB` data dictionary during `ROLLBACK` operations, to improve concurrency for `REPLACE` statements. (Bug #54538)

- **InnoDB Storage Engine**: Improved the performance of `UPDATE` operations on `InnoDB` tables, when only non-indexed columns are changed. (Bug #56340)

- **InnoDB Storage Engine**: The server could crash with a high volume of concurrent `LOCK TABLES` and `UNLOCK TABLES` statements. (Bug #57345)

- **InnoDB Storage Engine**: The server could crash on shutdown, if started with `--innodb-use-system-malloc=0`. (Bug #55627)

- **InnoDB Storage Engine**: A heavy workload with a large number of threads could cause a crash in the debug version of the server. (Bug #55699)

- **InnoDB Storage Engine**: When MySQL was restarted after a crash with the option `innodb_force_recovery=6`, certain queries against `InnoDB` tables could fail, depending on `WHERE` or `ORDER BY` clauses.

  Usually in such a disaster recovery situation, you dump the entire table using a query without these clauses. During advanced troubleshooting, you might use queries with these clauses to diagnose the position of the corrupted data, or to recover data following the corrupted part. (Bug #55832)

- **InnoDB Storage Engine**: For debug builds, a `SELECT ... FOR UPDATE` statement affecting a range of rows in an `InnoDB` table could cause a server crash. (Bug #56716)

- **InnoDB Storage Engine**: If the server crashed during an `ALTER TABLE` operation on an `InnoDB` table, examining the table

through SHOW CREATE TABLE or querying the INFORMATION_SCHEMA tables could cause the server to stop with an assertion error. (Bug #56982)

- **InnoDB Storage Engine**: InnoDB incorrectly reported an error when a cascading foreign key constraint deleted more than 250 rows. (Bug #57255)
- **InnoDB Storage Engine**: With multiple buffer pools enabled, InnoDB could flush more data from the buffer pool than necessary, causing extra I/O overhead. (Bug #54346)
- **InnoDB Storage Engine**: The CHECK TABLE command could cause a time-consuming verification of the InnoDB adaptive hash index memory structure. Now this extra checking is only performed in binaries built for debugging. (Bug #55716)
- **InnoDB Storage Engine**: InnoDB transactions could be incorrectly committed during recovery, rather than rolled back, if the server crashed and was restarted after performing ALTER TABLE ... ADD PRIMARY KEY on an InnoDB table, or some other operation that involves copying the entire table. (Bug #53756)
- **InnoDB Storage Engine**: Setting the PACK_KEYS=0 table option for an InnoDB table prevented new indexes from being added to the table. (Bug #54606)
- **InnoDB Storage Engine**: The server could crash when opening an InnoDB table linked through foreign keys to a long chain of child tables. (Bug #54582)
- **InnoDB Storage Engine**: InnoDB startup messages now include the start and end times for buffer pool initialization, and the total buffer pool size. (Bug #48026)
- **Partitioning**: An ALTER TABLE statement acting on table partitions that failed while the affected table was locked could cause the server to crash. (Bug #56172)
- **Partitioning**: Multiple-table UPDATE statements involving a partitioned MyISAM table could cause this table to become corrupted. Not all tables affected by the UPDATE needed to be partitioned for this issue to be observed. (Bug #55458)
- **Partitioning**: EXPLAIN PARTITIONS returned bad estimates for range queries on partitioned MyISAM tables. In addition, values in the rows column of EXPLAIN PARTITIONS output did not take partition pruning into account. (Bug #53806, Bug #46754)
- **Replication**: SET PASSWORD caused failure of row-based replication between a MySQL 5.1 master and a MySQL 5.5 slave.

  This fix makes it possible to replicate SET PASSWORD correctly, using row-based replication between a master running MySQL 5.1.53 or a later MySQL 5.1 release to a slave running MySQL 5.5.7 or a later MySQL 5.5 release. (Bug #57098)

  References: See also Bug #55452, Bug #57357.
- **Replication**: When a slave tried to execute a transaction larger than the slave's value for max_binlog_cache_size, it crashed. This was caused by an assertion that the server should roll back only the statement but not the entire transaction when the error ER_TRANS_CACHE_FULL occurred. However, the slave SQL thread always rolled back the entire transaction whenever any error occurred, regardless of the type of error. (Bug #55375)
- **Replication**: The error message for ER_SLAVE_HEARTBEAT_VALUE_OUT_OF_RANGE was hard coded in English in sql_yacc.yy, so that it could not be translated in errmsg.txt for other languages.

  Additionally, this same error message was used for three separate error conditions:

  - When the heartbeat period exceeded the value of slave_net_timeout.
  - When the heartbeat period was nonnegative but shorter than 1 millisecond.
  - When the value for the heartbeat period was either negative or greater than the maximum permitted.

  These issues have been addressed as follows:

  - By using three distinct error messages for each of the conditions listed previously.
  - By moving the sources for these error messages into the errmsg-utf8.txt file to facilitate translations into languages other than English.

  (Bug #54144)
- **Replication**: Backticks used to enclose identifiers for savepoints were not preserved in the binary log, which could lead to replication failure when the identifier, stripped of backticks, could be misinterpreted, causing a syntax or other error.

  This could cause problems with MySQL application programs making use of generated savepoint IDs. If, for instance,

`java.sql.Connection.setSavepoint()` is called without any parameters, Connector/J automatically generates a savepoint identifier consisting of a string of hexadecimal digits `0`-`F` encased in backtick (`) characters. If such an ID took the form `` `NeN` `` (where *N* represents a string of the decimal digits `0`-`9`, and `e` is a literal uppercase or lowercase "E" character). Removing the backticks when writing the identifier into the binary log left behind a substring which the slave MySQL server tried to interpret as a floating point number, rather than as an identifier. The resulting syntax error caused loss of replication. (Bug #55961)

References: See also Bug #55962.

- **Replication**: Prepared multiple-row `INSERT DELAYED` statements were written to the binary log without `DELAYED`. (Bug #56678, Bug #11763907)

  References: This bug is a regression of Bug #54579, Bug #11762035.

- The server entered an infinite loop with high CPU utilization after an error occurred during flushing of the I/O cache. (Bug #55629)

- Performance for certain read-only queries, in particular `point_select`, had deteriorated compared to previous versions. (Bug #56585)

- For the Performance Schema, the default number of rwlock classes was increased to 30, and the default number of rwlock and mutex instances was increased to 1 million. These changes were made to account for the volume of data instrumented when the `InnoDB` storage engine is used (because of the `InnoDB` buffer pool). (Bug #55576)

- `MIN()` or `MAX()` with a subquery argument could raise a debug assertion for debug builds or return incorrect data for nondebug builds. (Bug #54465)

- `INFORMATION_SCHEMA` plugins with no `deinit()` method resulted in a memory leak. (Bug #54253)

- If a view was named as the destination table for `CREATE TABLE ... SELECT`, the server produced a warning whether or not `IF NOT EXISTS` was used. Now it produces a warning only when `IF NOT EXISTS` is used, and an error otherwise. (Bug #55777)

- Setting `SETUP_INSTRUMENTS.TIMER = 'NO'` caused `TIMER_WAIT` values for aggregations to be `NULL` rather than 0. (Bug #53874)

- Short (single-letter) command-line options did not work. (Bug #55873)

- Queries involving predicates of the form *`const`* `NOT BETWEEN` *`not_indexed_column`* `AND` *`indexed_column`* could return incorrect data due to incorrect handling by the range optimizer. (Bug #54802)

- A negative `TIME` argument to `MIN()` or `MAX()` could raise an assertion. (Bug #56120)

- After the fix for Bug #39653, the shortest available secondary index was used for full table scans. The primary clustered key was used only if no secondary index could be used. However, when the chosen secondary index includes all columns of the table being scanned, it is better to use the primary index because the amount of data to scan is the same but the primary index is clustered. This is now taken into account. (Bug #55656)

- If one session attempted to drop a database containing a table which another session had opened with `HANDLER`, any instance of `ALTER DATABASE`, `CREATE DATABASE`, or `DROP DATABASE` issued by the latter session produced a deadlock. (Bug #54360)

- In debug builds, the server raised an assertion for `DROP DATABASE` in installations that had an outdated or corrupted `mysql.proc` table. For example, this affected `mysql_upgrade` when run as part of a MySQL 5.1 to 5.5 upgrade. (Bug #56137)

- The ordering for supplementary characters in the `utf8mb4_bin`, `utf16_bin`, and `utf32_bin` collations was incorrect. (Bug #55980)

- It was possible to compile `mysqld` with Performance Schema support but with a dummy atomic-operations implementation, which caused a server crash. This problem does not affect binary distributions. It is helpful as a safety measure for users who build MySQL from source. (Bug #56521)

- Row subqueries producing no rows were not handled as `UNKNOWN` values in row-comparison expressions. (Bug #54190)

- With an `UPDATE IGNORE` statement including a subquery that was evaluated using a temporary table, an error transferring the data from the temporary was ignored, causing an assertion to be raised. (Bug #54543)

- If a query specified a `DATE` or `DATETIME` value in a format different from `'YYYY-MM-DD HH:MM:SS'`, a greater-than-or-equal (`>=`) condition matched only greater-than values in an indexed `TIMESTAMP` column. (Bug #55779, Bug #50774, Bug #11758558)

- If there was an active `SELECT` statement, an error arising during trigger execution could cause a server crash. (Bug #55421)
- A buffer overrun could occur when formatting `DBL_MAX` numbers. (Bug #57209)
- The `tcmalloc` library was missing from binary MySQL packages for Linux. (Bug #56267)
- If an application using the embedded server called `mysql_library_init()` a second time after calling `mysql_library_init()` and `mysql_library_end()` to start and stop the server, the application crashed when reading option files. (Bug #53251)
- Assignment of `InnoDB` scalar subquery results to a variable resulted in unexpected `S` locks in `READ COMMITTED` transaction isolation level. (Bug #55382)
- The `max_length` metadata value of `MEDIUMBLOB` types was reported as 1 byte greater than the correct value. (Bug #53296)
- The server could crash during shutdown due to a race condition relating to Performance Schema cleanup. (Bug #55105, Bug #56324)
- The server could crash inside `memcpy()` when reading certain Performance Schema tables. (Bug #56761, Bug #58003)
- Memory leaks detected by Valgrind were corrected. (Bug #56709)
- `ALTER TABLE` on a `MERGE` table could result in deadlock with other connections. (Bug #56292, Bug #57002)
- An `INSERT DELAYED` statement for a `MERGE` table could cause deadlock if it occurred as part of a transaction or under `LOCK TABLES`, and there was a concurrent DDL or `LOCK TABLES ... WRITE` statement that tried to lock one of its underlying tables. (Bug #56251)
- The server crashed if a table maintenance statement such as `ANALYZE TABLE` or `REPAIR TABLE` was executed on a `MERGE` table and opening and locking a child table failed. For example, this could happen if a child table did not exist or if a lock timeout happened while waiting for a conflicting metadata lock to disappear.

  As a consequence of this bug fix, it is now possible to use `CHECK TABLE` for log tables without producing an error. (Bug #56422, Bug #56494)
- In debug builds, `FLUSH TABLE table_list WITH READ LOCK` for a `MERGE` table led to an assertion failure if one of the table's children was not present in the list of tables to be flushed. (Bug #55273)
- Deadlock could occur for heavily concurrent workloads consisting of a mix of DML, DDL, and `FLUSH TABLES` statements affecting the same set of tables. (Bug #56715, Bug #56404, Bug #56405)
- A bad `DBUG_PRINT` statement in `fill_schema_schemata()` caused server crashes on Solaris. (Bug #54478)
- Executing `XA END` after an XA transaction was already ended raised an assertion. (Bug #56448)
- Comparison of one `STR_TO_DATE()` result with another could return incorrect results. (Bug #56271)
- On Solaris with `gcc` 3.4.6, `ha_example.so` was built with DTrace support even if the server was not, causing plugin loading problems. (Bug #55966)
- On Mac OS X, `RENAME TABLE` raised an assertion if the `lower_case_table_names` system variable was 2 and the old table name was specified in uppercase. (Bug #56595)
- When `mysqld` was started as a service on Windows and `mysqld` was writing the error log to a file (for example, if it was started with the `--log-error` option), the server reassigned the file descriptors of the `stdout` and `stderr` streams to the file descriptor of the log file. On Windows, if `stdout` or `stderr` is not associated with an output stream, the file descriptor returns a negative value. Previously, this caused the file descriptor reassignment to fail and the server to abort. To avoid this problem on Windows, the server now first assigns the `stdout` and `stderr` streams to the log file stream by opening this file. This causes the `stdout` and `stderr` file descriptors to be nonzero and the server can successfully reassign them to the file descriptor of the log file. (Bug #56821)

  References: This bug is a regression of Bug #29751.
- `CASE` expressions with a mix of operands in different character sets sometimes returned incorrect results. (Bug #55744)
- Constant `SUBTIME()` expressions could return incorrect results. (Bug #57039)
- `COALESCE()` in MySQL 5.5 could return a result different from MySQL 5.1 for some arguments. (Bug #57095)
- A `SELECT` statement could produce a number of rows different from a `CREATE TABLE ... SELECT` that was supposed to select the same rows. (Bug #56423)

References: This bug is a regression of Bug #38999.

- Using `REPAIR TABLE tbl_name USE_FRM` on a `MERGE` table caused the server to crash. (Bug #46339)
- In `LOAD DATA INFILE`, using a `SET` clause to set a column equal to itself caused a server crash. (Bug #51850)
- The `plugin_ftparser.h` and `plugin_audit.h` include files are part of the public API/ABI, but were not tested by the ABI check. (Bug #52821)
- The fix for Bug #30234 caused the server to reject the `DELETE tbl_name.* ...` Access compatibility syntax for multiple-table `DELETE` statements. (Bug #53034)
- An atomic "compare and swap" operation using x86 assembly code (32 bit) could access incorrect data, which would make it work incorrectly and lose the intended atomicity. This in turn caused the MySQL server to work on inconsistent data structures and return incorrect data. That code affected only 32-bit builds; the effect has been observed when `icc` was used to build binaries. With `gcc`, no incorrect results have been observed during tests, so this fix is a proactive one. Other compilers do not use this assembly code. (Bug #52419)
- In some cases, when the left part of a `NOT IN` subquery predicate was a row and contained `NULL` values, the query result was incorrect. (Bug #51070)
- `EXPLAIN` produced an incorrect `rows` value for queries evaluated using an index scan and that included `LIMIT`, `GROUP BY`, and `ORDER BY` on a computed column. (Bug #50394)
- For some queries, the optimizer produced incorrect results using the Index Merge access method with `InnoDB` tables. (Bug #50402)
- `mysql_store_result()` and `mysql_use_result()` are not for use with prepared statements and are not intended to be called following `mysql_stmt_execute()`, but failed to return an error when invoked that way. (Bug #47485)
- `CHECKSUM TABLE` for Performance Schema tables could cause a server crash due to uninitialized memory reads. (Bug #50557)
- If the global and session `debug` system variables had the same value, the debug trace file could be closed twice, leading to freeing already freed memory and a server crash. (Bug #46165)
- An assertion could be raised by `DELETE` on a view that referenced another view which in turn (directly or indirectly) referenced more than one table. (Bug #51099)
- Multiple-statement execution could fail. (Bug #40877)
- Trailing space removal for `utf32` strings was done with non-multibyte-safe code, leading to incorrect result length and assertion failure. (Bug #42511)
- A malformed packet sent by the server when the query cache was in use resulted in lost-connection errors. (Bug #42503)
- `CREATE TABLE` failed if a column referred to in an index definition and foreign key definition had different lettercases in the two definitions. (Bug #39932)
- If `ALTER EVENT` failed to load an event after altering it, an assertion could be raised. This could occur, for example, if `ALTER EVENT` was killed with `KILL QUERY`. (Bug #44171)
- `mysqlcheck` behaved differently depending on the order in which options were given on the command line. (Bug #35269)
- When invoked to display a help message, `mysqld` also displayed spurious warning or error messages. (Bug #30025)

D.1.17. Changes in MySQL 5.5.6 (13 September 2010, Release Candidate)

Functionality Added or Changed

- **Incompatible Change**: The `SHA2()` function now returns a character string with the connection character set and collation. Previously, it returned a binary string. This is the same change made for several other encryption functions in MySQL 5.5.3. (Bug #54661)
- **InnoDB Storage Engine**: The mechanism that checks if there is enough space for redo logs was improved, reducing the chance of encountering this message: `ERROR: the age of the last checkpoint is x, which exceeds the log group capacity y`. (Bug #39168)

- **InnoDB Storage Engine**: Improved performance and scalability on Windows systems, especially for Windows Vista and higher. Re-enabled the use of atomic instructions on Windows systems. For Windows Vista and higher, reduced the number of event handles used. To compile on Windows systems now requires Windows SDK v6.0 or later; either upgrade to Visual Studio 2008 or 2010, or for Visual Studio 2005, install Windows SDK Update for Windows Vista. (Bug #22268)

- Overhead for the Performance Schema interface was reduced. (Bug #55087)

- Previously, `MySQL-shared-compat` RPMs for Linux contained both the current and previous client library versions for the target platform. Thus, the package contents overlapped with `MySQL-shared` RPMs, which contain only the current client library version. This can result in problems in two cases:

  - When the `MySQL-shared` RPM is installed but later it is determined that the `MySQL-shared-compat` RPM is needed (an application is installed that was linked against an older client library). Installing the `MySQL-shared-compat` RPM results in a conflict because both include the current library version. This can be overcome by using the `--force` option to RPM, or by first uninstalling the `MySQL-shared` RPM (which breaks dependencies).

  - When the `MySQL-shared-compat` RPM is installed, but old applications that require it are removed or upgraded to the current library version. In this case, `MySQL-shared-compat` cannot be replaced with `MySQL-shared` as long as current applications are installed. This can be overcome by using the `--force` option to RPM, which incurs the risk of breaking dependencies.

  Now the `MySQL-shared-compat` RPMs include only older client library versions and no longer include the current version, so that the `MySQL-shared` and `MySQL-shared-compat` RPM contents no longer overlap. The `MySQL-shared-compat` RPM can be installed even if the `MySQL-shared` RPM is installed, without producing conflicts related to the current library version. The `MySQL-shared-compat` RPM can be uninstalled when old applications are removed or upgraded to the current library version, without breaking applications that already use the current library version.

  If you previously installed the `MySQL-shared-compat` RPM because you needed both the current and previous libraries, you should install both the `MySQL-shared` and `MySQL-shared-compat` RPMs now. (Bug #56150)

  References: See also Bug #12368215.

- Within stored programs, `LIMIT` clauses now permit integer-valued routine parameters or local variables as parameters. (Bug #11918)

- Code was removed for the following no-longer-supported platforms: NetWare, MS-DOS, VMS, QNX, and 32-bit SPARC.

Bugs Fixed

- **InnoDB Storage Engine**: **Security Fix**: After changing the values of the `innodb_file_format` or `innodb_file_per_table` configuration parameters, DDL statements could cause a server crash. (Bug #55039, CVE-2010-3676)

- **Security Fix**: Queries could cause a server crash if the `GREATEST()` or `LEAST()` function had a mixed list of numeric and `LONGBLOB` arguments, and the result of such a function was processed using an intermediate temporary table. (Bug #54461, CVE-2010-3838)

- **Security Fix**: During evaluation of arguments to extreme-value functions such as `LEAST()` and `GREATEST()`, type errors did not propagate properly, causing the server to crash. (Bug #55826, CVE-2010-3833)

- **Security Fix**: The server could crash after materializing a derived table that required a temporary table for grouping. (Bug #55568, CVE-2010-3834)

- **Security Fix**: Queries with nested joins could cause an infinite loop in the server when used from stored procedures and prepared statements. (Bug #53544, CVE-2010-3839)

- **Security Fix**: `GROUP_CONCAT()` and `WITH ROLLUP` together could cause a server crash. (Bug #54476, CVE-2010-3837)

- **Security Fix**: Pre-evaluation of `LIKE` predicates during view preparation could cause a server crash. (Bug #54568, Bug #11762026, CVE-2010-3836)

- **Security Fix**: A user-variable assignment expression that is evaluated in a logical expression context can be precalculated in a temporary table for `GROUP BY`. However, when the expression value is used after creation of the temporary table, it was re-evaluated, not read from the table, and a server crash resulted. (Bug #55564, CVE-2010-3835)

- **Security Fix**: After `ALTER TABLE` was used on a temporary transactional table locked by `LOCK TABLES`, any later attempts to execute `LOCK TABLES` or `UNLOCK TABLES` caused a server crash. (Bug #54117)

- **Security Fix**: Use of `TEMPORARY InnoDB` tables with nullable columns could cause a server crash. (Bug #54044, CVE-

2010-3680)

- **Security Fix**: A malformed argument to the `BINLOG` statement could result in Valgrind warnings or a server crash. (Bug #54393, CVE-2010-3679)

- **Security Fix**: Incorrect handling of `NULL` arguments could lead to a crash for `IN()` or `CASE` operations when `NULL` arguments were either passed explicitly as arguments (for `IN()`) or implicitly generated by the `WITH ROLLUP` modifier (for `IN()` and `CASE`). (Bug #54477, CVE-2010-3678)

- **Security Fix**: Joins involving a table with a unique `SET` column could cause a server crash. (Bug #54575, CVE-2010-3677)

- **Security Fix**: Using `EXPLAIN` with queries of the form `SELECT ... UNION ... ORDER BY (SELECT ... WHERE ...)` could cause a server crash. (Bug #52711, CVE-2010-3682)

- **Security Fix**: Bug #49124 and Bug #11757121 were fixed.

- **Performance**: **InnoDB Storage Engine**: The setting `innodb_change_buffering=all` could produce slower performance for some operations than the previous default, `innodb_change_buffering=inserts`. (Bug #54914)

- **Performance**: **InnoDB Storage Engine**: An `EXPLAIN` plan for an `InnoDB` table could vary greatly in the estimated cost for a `BETWEEN` clause. (Bug #53761)

- **Incompatible Change**: **Replication**: As of MySQL 5.5.6, handling of `CREATE TABLE IF NOT EXISTS ... SELECT` statements has been changed for the case that the destination table already exists:

  - Previously, for `CREATE TABLE IF NOT EXISTS ... SELECT`, MySQL produced a warning that the table exists, but inserted the rows and wrote the statement to the binary log anyway. By contrast, `CREATE TABLE ... SELECT` (without `IF NOT EXISTS`) failed with an error, but MySQL inserted no rows and did not write the statement to the binary log.

  - MySQL now handles both statements the same way when the destination table exists, in that neither statement inserts rows or is written to the binary log. The difference between them is that MySQL produces a warning when `IF NOT EXISTS` is present and an error when it is not.

  This change in handling of `IF NOT EXISTS` results in an incompatibility for statement-based replication from a MySQL 5.1 master with the original behavior and a MySQL 5.5 slave with the new behavior. Suppose that `CREATE TABLE IF NOT EXISTS ... SELECT` is executed on the master and the destination table exists. The result is that rows are inserted on the master but not on the slave. (Row-based replication does not have this problem.)

  To address this issue, statement-based binary logging for `CREATE TABLE IF NOT EXISTS ... SELECT` is changed in MySQL 5.1 as of 5.1.51:

  - If the destination table does not exist, there is no change: The statement is logged as is.

  - If the destination table does exist, the statement is logged as the equivalent pair of `CREATE TABLE IF NOT EXISTS` and `INSERT ... SELECT` statements. (If the `SELECT` in the original statement is preceded by `IGNORE` or `REPLACE`, the `INSERT` becomes `INSERT IGNORE` or `REPLACE`, respectively.)

  This change provides forward compatibility for statement-based replication from MySQL 5.1 to 5.5 because when the destination table exists, the rows will be inserted on both the master and slave. To take advantage of this compatibility measure, the 5.1 server must be at least 5.1.51 and the 5.5 server must be at least 5.5.6.

  To upgrade an existing 5.1-to-5.5 replication scenario, upgrade the master first to 5.1.51 or higher. Note that this differs from the usual replication upgrade advice of upgrading the slave first.

  A workaround for applications that wish to achieve the original effect (rows inserted regardless of whether the destination table exists) is to use `CREATE TABLE IF NOT EXISTS` and `INSERT ... SELECT` statements rather than `CREATE TABLE IF NOT EXISTS ... SELECT` statements.

  Along with the change just described, the following related change was made: Previously, if an existing view was named as the destination table for `CREATE TABLE IF NOT EXISTS ... SELECT`, rows were inserted into the underlying base table and the statement was written to the binary log. As of MySQL 5.1.51 and 5.5.6, nothing is inserted or logged. (Bug #47442, Bug #47132, Bug #48814, Bug #49494)

- **Incompatible Change**: Several changes were made to Performance Schema tables:

  - The `SETUP_OBJECTS` table was removed.

  - The `PROCESSLIST` table was renamed to `THREADS`.

  - The `EVENTS_WAITS_SUMMARY_BY_EVENT_NAME` table was renamed to

EVENTS_WAITS_SUMMARY_GLOBAL_BY_EVENT_NAME.

(Bug #55416)

- **Incompatible Change**: Handling of warnings and errors during stored program execution was problematic:

  - If one statement generated several warnings or errors, only the handler for the first was activated, even if another might be more appropriate. Now the server chooses the more appropriate handler.

  - Warning or error information could be lost.

  (Bug #36185, Bug #5889, Bug #9857, Bug #23032)

- **Incompatible Change**: If the server was started with `character_set_server` set to `utf16`, it crashed during full-text stopword initialization. Now the stopword file is loaded and searched using `latin1` if `character_set_server` is `ucs2`, `utf16`, or `utf32`.

  If any table was created with `FULLTEXT` indexes while the server character set was `ucs2`, `utf16`, or `utf32`, it should be repaired using this statement:

  ```
  REPAIR TABLE tbl_name QUICK;
  ```

  (Bug #32391)

- **Important Change**: **Replication**: The `LOAD DATA INFILE` statement is now considered unsafe for statement-based replication. When using statement-based logging mode, the statement now produces a warning; when using mixed-format logging, the statement is made using the row-based format. (Bug #34283)

- **InnoDB Storage Engine**: The `Lock_time` field in the slow query log now reports a larger value, including the time for `InnoDB` lock waits at the statement level. (Bug #53496)

- **InnoDB Storage Engine**: The `InnoDB` storage engine was not included in the default installation when using the `configure` script. (Bug #55547)

- **InnoDB Storage Engine**: The `mysql_config` tool did not output the requirement for the `aio` library for `mysqld-libs`. (Bug #55215)

- **InnoDB Storage Engine**: Some memory used for `InnoDB` asynchronous I/O was not freed at shutdown. (Bug #54764)

- **InnoDB Storage Engine**: For an `InnoDB` table with an auto-increment column, the server could crash if the first statement that references the table after a server restart is a `SHOW CREATE TABLE` statement. (Bug #55277)

- **InnoDB Storage Engine**: The server could crash during the recovery phase of startup, if it previously crashed while inserting `BLOB` or other large columns that use off-page storage into an `InnoDB` table created with `ROW_FORMAT=REDUNDANT` or `ROW_FORMAT=COMPACT`. (Bug #54408)

- **InnoDB Storage Engine**: For an `InnoDB` table created with `ROW_FORMAT=COMPRESSED` or `ROW_FORMAT=DYNAMIC`, a query using the `READ UNCOMMITTED` isolation level could cause the server to stop with an assertion error, if `BLOB` or other large columns that use off-page storage were being inserted at the same time. (Bug #54358)

- **InnoDB Storage Engine**: For debug builds, the database server could crash when renaming a table that had active transactions. (Bug #54453)

- **InnoDB Storage Engine**: Fast index creation in the `InnoDB Plugin` could fail, leaving the new secondary index corrupted. (Bug #54330)

- **InnoDB Storage Engine**: `InnoDB` could issue an incorrect message on startup, if tables were created under the setting `innodb_file_per_table=ON`. The message was of the form `InnoDB: Warning: allocated tablespace n, old maximum was 0`. If you encounter this message after upgrading, create an `InnoDB` table with `innodb_file_per_table = ON` and restart the server. The message should not be displayed any more. If you continue to encounter this message, or if you get it and haven't used a version without this fix, you might have corruption in your shared tablespace. If so, back up and reload your data. (Bug #54658)

- **InnoDB Storage Engine**: An `ALTER TABLE` statement could convert an `InnoDB` compressed table (with `row_format=compressed`) back to an uncompressed table (with `row_format=compact`). (Bug #54679)

- **InnoDB Storage Engine**: The output from the `SHOW ENGINE INNODB STATUS` command now includes information about "spin rounds" for RW-locks (both shared and exclusive locks). (Bug #54726)

- **InnoDB Storage Engine**: If a session executing `TRUNCATE TABLE` on an `InnoDB` table was killed during

`open_tables()`, an assertion could be raised. (Bug #53757)

- **InnoDB Storage Engine**: Implementation of the 64-bit `dulint` structure in `InnoDB` was not optimized for 64-bit processors, resulting in excessive storage and reduced performance. (Bug #54728)

- **InnoDB Storage Engine**: An assertion was raised if (1) an `InnoDB` table was created using `CREATE TABLE ... SELECT` where the query used an `INFORMATION_SCHEMA` table and a view existed in the database; or (2) any statement that modified an `InnoDB` table had a subquery referencing an `INFORMATION_SCHEMA` table. (Bug #55973)

- **InnoDB Storage Engine**: Performing large numbers of `RENAME TABLE` statements caused excessive memory use. (Bug #47991)

- **InnoDB Storage Engine**: `InnoDB` could not create tables that used the `utf32` character set. (Bug #52199)

- **InnoDB Storage Engine**: Misimplementation of the `os_fast_mutex_trylock()` function in `InnoDB` resulted in unnecessary blocking and reduced performance. (Bug #53204)

- **Partitioning**: An `ALTER TABLE ... ADD PARTITION` statement run concurrently with a read lock caused spurious `ER_TABLE_EXISTS_ERROR` and `ER_NO_SUCH_TABLE` errors on subsequent attempts. (Bug #53676)

  References: See also Bug #53770.

- **Partitioning**: With `innodb_thread_concurrency = 1`, `ALTER TABLE ... REORGANIZE PARTITION` and `SELECT` could deadlock. There were unreleased latches in the `ALTER TABLE ... REORGANIZE PARTITION` thread which were needed by the `SELECT` thread to be able to continue. (Bug #54747)

- **Partitioning**: `ALTER TABLE ... TRUNCATE PARTITION`, when called concurrently with transactional DML on the table, was executed immediately and did not wait for the concurrent transaction to release locks. As a result, the `ALTER TABLE` statement was written into the binary log before the DML statement, which led to replication failures when using row-based logging. (Bug #49907)

  References: See also Bug #42643.

- **Partitioning**: When the storage engine used to create a partitioned table was disabled, attempting to drop the table caused the server to crash. (Bug #46086)

- **Partitioning**: `INSERT ON DUPLICATE KEY UPDATE` statements performed poorly on tables having many partitions. The handler function for reading a row from a specific index was not optimized in the partitioning handler. (Bug #52455)

- **Partitioning**: `UPDATE` and `INSERT` statements affecting partitioned tables performed poorly when using row-based replication. (Bug #52517)

  References: This bug is a regression of Bug #39084.

- **Replication**: If the SQL thread was started while the I/O thread was performing rotation of the relay log, the two threads could begin to race for the same I/O cache, leading to a server crash. (Bug #54509)

  References: See also Bug #50364.

- **Replication**: The value of `binlog_direct_non_transactional_updates` had no effect on statements mixing transactional tables and nontransactional tables, or mixing temporary tables and nontransactional tables.

  As part of the fix for this issue, updates to temporary tables are now handled as transactional or nontransactional according to their storage engine types. (In effect, the current fix reverts a change made previously as part of the fix for Bug #53259.)

  In addition, unsafe mixed statements (that is, statements which access transactional table as well nontransactional or temporary tables, and write to any of them) are now handled as transactional when the statement-based logging format is in use. (Bug #53452)

  References: See also Bug #51894.

- **Replication**: A number of statements generated unnecessary warnings as potentially unsafe statements. (Due to the fix for Bug #51894, a temporary table is treated in this context as a transactional table, so that any mixed statement such as `t_innodb` + `t_myisam` or `t_temp` + `t_myisam` is flagged as unsafe.)

  To reduce the number of spurious warnings produced when this happened, some of the criteria used to classify a statements as safe or unsafe have been changed. For more information about handling of mixed statements, see Transactional, nontransactional, and mixed statements. (Bug #53259)

  References: See also Bug #53452, Bug #54872.

- **Replication**: When using the row-based logging format, a failed `CREATE TABLE ... SELECT` statement was written to the binary log, causing replication to break if the failed statement was later re-run on the master. In such cases, a `DROP TABLE ... IF EXIST` statement is now logged in the event that a `CREATE TABLE ... SELECT` fails. (Bug #55625)

- **Replication**: When using the row-based logging format, a `SET PASSWORD` statement was written to the binary log twice. (Bug #55452)

- **Replication**: When closing temporary tables, after the session connection was already closed, if the writing of the implicit `DROP TABLE` statement into the binary log failed, it was possible for the resulting error to be mishandled, triggering an assertion. (Bug #55387)

- **Replication**: Executing `SHOW BINLOG EVENTS` increased the value of `max_allowed_packet` applying to the session that executed the statement. (Bug #55322)

- **Replication**: Setting `binlog_format` to `ROW`, then creating and dropping a temporary table led to an assertion. (Bug #54925)

- **Replication**: When using mixed-format replication, changes made to a nontransactional temporary table within a transaction were not written into the binary log when the transaction was rolled back. This could lead to a failure in replication if the temporary table was used again afterwards. (Bug #54872)

  References: See also Bug #53259.

- **Replication**: If `binlog_format` was explicitly switched from `STATEMENT` to `ROW` following the creation of a temporary table, then on disconnection the master failed to write the expected `DROP TEMPORARY TABLE` statement into the binary log. As a consequence, temporary tables (and their corresponding files) accumulated as this scenario was repeated. (Bug #54842)

  References: See also Bug #52616.

- **Replication**: Two related issues involving temporary tables and transactions were introduced by a fix made in MySQL 5.1.37:

  1. When a temporary table was created or dropped within a transaction, any failed statement that following the `CREATE TEMPORARY TABLE` or `DROP TEMPORARY TABLE` statement triggered a rollback, which caused the slave to diverge from the master.

  2. When a `CREATE TEMPORARY TABLE ... SELECT * FROM ...` statement was executed within a transaction in which only tables using transactional storage engines were used and the transaction was rolled back at the end, the changes—including the creation of the temporary table—were not written to the binary log.

  The current fix restores the correct behavior in both of these cases. (Bug #53560)

  References: This bug was introduced by Bug #43929.

- **Replication**: When `binlog_format=STATEMENT`, any statement that is flagged as being unsafe, possibly causing the slave to go out of sync, generates a warning. This warning is written to the server log, the warning count is returned to the client in the server's response, and the warnings are accessible through `SHOW WARNINGS`.

  The current bug affects only the counts for warnings to the client and that are visible through `SHOW WARNINGS`; it does not affect which warnings are written to the log. The current issue came about because the fix for an earlier issue caused warnings for substatements to be cleared whenever a new substatement was started. However, this suppressed warnings for unsafe statements in some cases. Now, such warnings are no longer cleared. (Bug #50312)

  References: This bug was introduced by Bug #36649.

- **Replication**: When `CURRENT_USER()` or `CURRENT_USER` was used to supply the name and host of the affected user or of the definer in any of the statements `DROP USER`, `RENAME USER`, `GRANT`, `REVOKE`, and `ALTER EVENT`, the reference to `CURRENT_USER()` or `CURRENT_USER` was not expanded when written to the binary log. This resulted in `CURRENT_USER()` or `CURRENT_USER` being expanded to the user and host of the slave SQL thread on the slave, thus breaking replication. Now `CURRENT_USER()` and `CURRENT_USER` are expanded prior to being written to the binary log in such cases, so that the correct user and host are referenced on both the master and the slave. (Bug #48321)

- **Replication**: Replication could break if a transaction involving both transactional and nontransactional tables was rolled back to a savepoint. It broke if a concurrent connection tried to drop a transactional table which was locked after the savepoint was set. This `DROP TABLE` completed when `ROLLBACK TO SAVEPOINT` was executed because the lock on the table was dropped by the transaction. When the slave later tried to apply the binary log events, it failed because the table had already been dropped. (Bug #50124)

- After an RPM installation, `mysqld` would be started with the `root` user, rather than the `mysql` user. (Bug #56574)

- When upgrading an existing install with an RPM on Linux, the MySQL server might not have been restarted properly. This was due to a naming conflict when upgrading from a `community` named RPM. Previous installations are now correctly removed,

the MySQL initialization script is recreated, and the MySQL server is restarted as normal. (Bug #55015)

- `CMake` produced bad dependencies for the `sql/lex_hash.h` file during configuration. (Bug #55842)
- The default compiler options for Mac OS X 10.5 were set incorrectly. (Bug #55601)
- The Windows MSI installer failed during installation to preserve custom settings, such as the configured data directory. (Bug #55169)
- The `-features=no%except` option was missing from the build for Solaris/x86. (Bug #55250)
- Building MySQL on Solaris 8 x86 failed when using Sun Studio due to `gcc` inline assembly code. (Bug #55061)
- Builds of MySQL generated a large number of warnings. (Bug #53445)
- Performance Schema header files were not installed in the correct directory. (Bug #53255)
- Missing Performance Schema tables were not reported in the error log at server startup. (Bug #53617)
- `SHOW ENGINE PERFORMANCE_SCHEMA STATUS` underreported the amount of memory allocated by the Performance Schema. (Bug #53566)
- A client with automatic reconnection enabled saw the error message `Lost connection to MySQL server during query` if the connection was lost between the `mysql_stmt_prepare()` and `mysql_stmt_execute()` C API functions. However, `mysql_stmt_errno()` returned 0, not the corresponding error number 2013. (Bug #53899)
- A client could supply data in chunks to a prepared statement parameter other than of type `TEXT` or `BLOB` using the `mysql_stmt_send_long_data()` C API function (or `COM_STMT_SEND_LONG_DATA` command). This led to a crash because other data types are not valid for long data. (Bug #54041)
- The server failed to disregard sort order for some zero-length tuples, leading to an assertion failure. (Bug #54459)
- If a session tried to drop a database containing a table opened with `HANDLER` in another session, any `DATABASE` statement (`CREATE`, `DROP`, `ALTER`) executed by that session produced a deadlock. (Bug #54360)
- A signal-handler redefinition for `SIGUSR1` was removed. The redefinition could cause the server to encounter a kernel deadlock on Solaris when there are many active threads. Other POSIX platforms might also be affected. (Bug #54667)
- Assignments of the `PASSWORD()` or `OLD_PASSWORD()` function to a user variable did not preserve the character set of the function return value. (Bug #54668)
- `mysql_secure_installation` did not properly identify local accounts and could incorrectly remove nonlocal `root` accounts. (Bug #54004)
- In a slave SQL thread or Event Scheduler thread, the `SLEEP()` function could not sleep more than five seconds. (Bug #54729)
- Performance Schema event collection for a thread could “leak” from one connection to another if the thread was used for one connection, then cached, then reused for another connection. (Bug #54782)
- The Performance Schema displayed spurious startup error messages when the server was run in bootstrap mode. (Bug #54467)
- The patch for Bug #36569 caused performance regressions and incorrect execution of some `UPDATE` statements. (Bug #53737, Bug #53742)
- `INFORMATION_SCHEMA.ENGINES` and `SHOW ENGINES` described `MyISAM` as the default storage engine, but this is not true as of MySQL 5.5.5. (Bug #54832)
- `INFORMATION_SCHEMA.COLUMNS` reported incorrect precision for `BIGINT UNSIGNED` columns. (Bug #53814)
- Incorrect error handling could result in an `OPTIMIZE TABLE` crash. (Bug #54783)
- In debug builds, an assertion could be raised when the server tried to send an OK packet to the client after having failed to detect errors during processing of the `WHERE` condition of an `UPDATE` statement. (Bug #54734)
- `SET sql_select_limit = 0` did not work. (Bug #54682)
- `mysql_upgrade` could incorrectly remove `TRIGGER` privileges. (Bug #53613)
- Queries that named view columns in a `GROUP BY` clause could cause a server crash. (Bug #54515)
- Portability problems in `SHOW STATUS` could lead to incorrect results on some platforms. (Bug #53493)

- `GROUP BY` operations used `max_sort_length` inconsistently. (Bug #55188)
- `mysqld_safe` contained a syntax error that prevented it from restarting the server. (Bug #54991)
- The `MERGE` storage engine tried to use memory mapping on the underlying `MyISAM` tables even on platforms that do not support it and even when `myisam_use_mmap` was disabled. This led to a hang for `INSERT INTO ... SELECT FROM` statements that selected from a `MyISAM` table into a `MERGE` table that contained the same `MyISAM` table. (Bug #54811, Bug #50788)
- `SHOW CREATE TRIGGER` took a stronger metadata lock than required. This caused the statement to be blocked unnecessarily. For example, `LOCK TABLES ... WRITE` in one session blocked `SHOW CREATE TRIGGER` in another session.

  Also, a `SHOW CREATE TRIGGER` statement issued inside a transaction did not release its metadata locks at the end of statement execution. Consequently, `SHOW CREATE TRIGGER` was able to block other sessions from accessing the table (for example, using `ALTER TABLE`). (Bug #55498)
- A `SHOW CREATE TABLE` statement issued inside a transaction did not release its metadata locks at the end of statement execution. Consequently, `SHOW CREATE TABLE` was able to block other sessions from accessing the table (for example, using `ALTER TABLE`). (Bug #54905)
- A single-table `DELETE` ordered by a column that had a hash-type index could raise an assertion or cause a server crash. (Bug #55472)
- Errors during processing of `WHERE` conditions in `HANDLER ... READ` statements were not detected, so the handler code still tried to send EOF to the client, raising an assertion. (Bug #54401)
- A statement that was aborted by `KILL QUERY` while it waited on a metadata lock could raise an assertion in debug builds, or send OK to the client instead of `ER_QUERY_INTERRUPTED` in regular builds. (Bug #55223)
- `mysql_upgrade` did not handle the `--ssl` option properly. (Bug #55672)
- Using `MIN()` or `MAX()` on a column containing the maximum `TIME` value caused a server crash. (Bug #55648)
- `INSERT IGNORE INTO ... SELECT` statements could raise a debug assertion. (Bug #54106)
- The server was not checking for errors generated during the execution of `Item::val_xxx()` methods when copying data to a group, order, or distinct temp table's row. (Bug #55580)
- `ORDER BY` clauses that included user-variable expressions could raise a debug assertion. (Bug #55565)
- For distributions built with `CMake` rather than the GNU autotools, `mysql` lacked `pager` support, and some scripts were built without the execute bit set. (Bug #54466, Bug #54129)
- The `thread_concurrency` system variable was unavailable on non-Solaris systems. (Bug #55001)
- A call to `mysql_library_init()` following a call to `mysql_library_end()` caused a client crash. (Bug #55345)
- If audit plugins were installed that were interested in `MYSQL_AUDIT_GENERAL_CLASS` events and the general query log was disabled, failed `INSTALL PLUGIN` or `UNINSTALL PLUGIN` statements caused a server crash. (Bug #54989)
- Incorrect handling of user variable assignments as subexpressions could lead to incorrect results or server crashes. (Bug #55615)
- `IF()` with a subquery argument could raise a debug assertion for debug builds under some circumstances. (Bug #55077)
- Deadlocks involving `INSERT DELAYED` statements were not detected. The server could crash if the delayed handler thread was killed due to a conflicting shared metadata lock. (Bug #54332)
- `SHOW CREATE EVENT` released all metadata locks held by the current transaction. This invalidated any existing savepoints and raised an assertion if `ROLLBACK TO SAVEPOINT` was executed. (Bug #54105)
- Some functions did not calculate their `max_length` metadata value correctly. (Bug #54916)
- The embedded server raised an assertion when it attempted to load plugins. (Bug #56085)
- `FORMAT()` did not respect the decimal point character if the locale was changed and always returned an ASCII value. (Bug #55912)
- After `ALTER TABLE` was used on a temporary transactional table locked by `LOCK TABLES`, any later attempts to execute `LOCK TABLES` or `UNLOCK TABLES` caused a server crash. (Bug #54117)

- `InnoDB` produced no warning at startup about illegal `innodb_file_format_check` values. (Bug #55095)
- A join with an aggregated function and impossible `WHERE` condition returned an extra row. (Bug #54416)
- The `PERFORMANCE_SCHEMA` database was not correctly created and populated on Windows. (Bug #52809)
- The optimization method of the `ARCHIVE` storage engine did not preserve the `.frm` file embedded in the `.ARZ` file when rewriting the `.ARZ` file for optimization. This meant an `ARCHIVE` table that had been optimized could not be discovered.

  The `ARCHIVE` engine stores the `.frm` file in the `.ARZ` file so it can be transferred from machine to machine without also needing to copy the `.frm` file. The engine subsequently restores the embedded `.frm` during discovery. (Bug #45377)
- The ABI check for MySQL failed to compile with `gcc` 4.5. (Bug #52514)
- The `mysql-debug.pdb` supplied with releases did not match the corresponding `mysqld.exe`. (Bug #52850)
- An assertion occurred in `ha_myisammrg.cc` line 1137:

  ```
  DBUG_ASSERT(this->file->children_attached);
  ```

  The problem was found while running RQG tests and the assertion occurred during `REPAIR`, `OPTIMIZE`, and `ANALYZE` operations. (Bug #47633)
- Attempts to access a nonexistent Performance Schema table resulted in a misleading error message. (Bug #52586)
- The Performance Schema could enter an infinite loop if required to create a large number of mutex instances. (Bug #52502)
- The server could crash when processing subqueries with empty results. (Bug #53236)
- The `large_pages` system variable was tied to the `--large-files` command-line option, not the `--large-pages` option. (Bug #52716)
- The results of some `ORDER BY ... DESC` queries were sorted incorrectly. (Bug #51431)
- `Index Merge` between three indexes could return incorrect results. (Bug #50389)
- Use of `uint` in `typelib.h` caused compilation problems in Windows. This was changed to `unsigned int`. (Bug #52959)
- `mysql_secure_installation` sometimes failed to locate the `mysql` client. (Bug #52274)
- `MIN()` and `MAX()` returned incorrect results for `DATE` columns if the set of values included `'0000-00-00'`. (Bug #49771)
- If a symbolic link was used in a file path name, the Performance Schema did not resolve all file I/O events to the same name. (Bug #52134)
- Reading a `ucs2` data file with `LOAD DATA INFILE` was subject to three problems. 1) Incorrect parsing of the file as `ucs2` data, resulting in incorrect length of the parsed string. This is fixed by truncating the invalid trailing bytes (incomplete multibyte characters) when reading from the file. 2) Reads from a proper `ucs2` file did not recognize newline characters. This is fixed by first checking whether a byte is a newline (or any other special character) before reading it as a part of a multibyte character. 3) When using user variables to hold column data, the character set of the user variable was set incorrectly to the database charset. This is fixed by setting it to the character set specified in the `LOAD DATA INFILE` statement, if any. (Bug #51876)
- With `lower_case_table_names` set to a nonzero value, searches for table or database names in `INFORMATION_SCHEMA` tables could produce incorrect results. (Bug #53095)
- Some queries involving `GROUP BY` and a function that returned `DATE` raised a debug assertion. (Bug #52159)
- Searches in `INFORMATION_SCHEMA` tables for rows matching a nonexistent database produced an error instead of an empty query result. (Bug #49542)
- `DROP DATABASE` failed if there was a `TEMPORARY` table with the same name as a non-`TEMPORARY` table in the database. (Bug #48067)
- `XA START` had a race condition that could cause a server crash. (Bug #51855)
- `PARTITION BY KEY` on a `utf32` `ENUM` column raised a debugging assertion. (Bug #52121)
- With `character_set_connection` set to `utf16` or `utf32`, `CREATE TABLE t1 AS SELECT HEX() ...` caused a server crash. (Bug #45263)

- `FLUSH TABLES WITH READ LOCK` in one session and `FLUSH TABLES tbl_list WITH READ LOCK` in another session were mutually exclusive.

  This bug fix involved several changes to the states displayed by `SHOW PROCESSLIST`:

  - `Table lock` was replaced with `Waiting for table level lock`.
  - `Waiting for table` was replaced with `Waiting for table flush`.
  - These states are new: `Waiting for global metadata lock`, `Waiting for schema metadata lock`, `Waiting for stored function metadata lock`, `Waiting for stored procedure metadata lock`, `Waiting for table metadata lock`.

  (Bug #52044)

- A pending `FLUSH TABLES tbl_list WITH READ LOCK` statement unnecessarily aborted transactions. (Bug #52117)
- Sort-`index_merge` for join tables other than the first table used excessive memory. (Bug #41660)
- A debugging assertion could be raised after a write failure to a closed socket. (Bug #42496)
- The `my_like_range_xxx()` functions returned badly formed maximum strings for Asian character sets, which caused problems for storage engines. (Bug #45012)
- Rows inserted in a table by one session were not immediately visible to another session that queried the table, even if the insert had committed. (Bug #37521)
- Enumeration plugin variables were subject to a type-casting error, causing inconsistent results between different platforms. (Bug #42144)
- `DROP TABLE` held a lock during `unlink()` file system operations, causing performance problems if `unlink()` took a long time. (Bug #41158)
- Reading from a temporary `MERGE` table, with two nontemporary child `MyISAM` tables, resulted in the error:

```
ERROR 1168 (HY000): Unable to open underlying table which is differently
defined or of non-MyISAM type or doesn't exist
```

  (Bug #36171)

- Statements of the form `UPDATE ... WHERE ... ORDER BY` used a `filesort` even when not required. (Bug #36569)

  References: See also Bug #53737, Bug #53742.

- `safemalloc` was excessively slow under certain conditions and has been removed. The `--skip-safemalloc` server option has also been removed, and the `--with-debug=full` configuration option is no different from `--with-debug`. (Bug #34043)
- Threads that were calculating the estimated number of records for a range scan did not respond to the `KILL` statement. That is, if a `range` join type is possible (even if not selected by the optimizer as a join type of choice and thus not shown by `EXPLAIN`), the query in the `statistics` state (shown by the `SHOW PROCESSLIST`) did not respond to the `KILL` statement. (Bug #25421)
- Problems in the atomic operations implementation could lead to server crashes. (Bug #22320, Bug #52261)

D.1.18. Changes in MySQL 5.5.5 (06 July 2010)

icc Notes

- This is the final release of MySQL 5.5 for which Generic Linux MySQL binary packages built with the `icc` compiler on x86 and x86_64 will be offered. These were previously produced as an alternative to our main packages built using `gcc`, as they provided noticeable performance benefits. In recent times the performance differences have diminished and build and runtime problems have surfaced, thus it is no longer viable to continue producing them.

  We continue to use the `icc` compiler to produce our distribution-specific RPM packages on ia64.

InnoDB Notes

- InnoDB has been upgraded to version 1.1.1. This version is considered of "early adopter" quality.

  InnoDB is now the default storage engine, rather than MyISAM, in the regular and enterprise versions of MySQL. This change has the following consequences:

  - Existing tables are not affected by this change, only new tables that are created.
  - Some of the InnoDB option settings also change, so that the default configuration represents the best practices for InnoDB functionality, reliability, and file management: innodb_file_format=Barracuda rather than Antelope, innodb_strict_mode=ON rather than OFF, and innodb_file_per_table=ON rather than OFF.
  - The system tables remain in MyISAM format.
  - MyISAM remains the default storage engine for the embedded version of MySQL.

  Follow these steps to ensure a smooth transition when upgrading:

  - Familiarize yourself with the new default setting for the InnoDB file-per-table option, which creates a separate .ibd file for each user table. Adapt any backup procedure to include these files. For details, see Section 13.3.3, "Using Per-Table Tablespaces".
  - Test the installation and operation for any applications that you run on the database server, to determine if they use any features specific to MyISAM that cause problems during installation (when the tables are created) or at runtime (when MyISAM-specific features might fail, or reliance on MyISAM settings for performance might become apparent). The InnoDB "strict" mode might also alert you to problems while setting up tables for an application.
  - As a preliminary test for individual tables rather than an entire application, you can use the statement ALTER TABLE *table_name* ENGINE=INNODB; to convert an existing table to use the InnoDB storage engine, and then run compatibility and performance tests.
  - Where necessary, add ENGINE=MYISAM clauses to CREATE TABLE statements, for tables that require features specific to MyISAM, such as full-text search.
  - Benchmark the most important queries, to check whether you need to make changes to the table indexes.
  - Measure the performance of applications under typical load, to check whether you need to change any additional InnoDB configuration settings.
  - As a last resort, if a database server is devoted entirely to applications that can only run with MyISAM tables, you could add a default-storage-engine line in the configuration file, or a --default-storage-engine option in the database server startup command, to re-enable MyISAM as the default storage engine for that server. For details about setting the default storage engine, see Section 13.1, "Setting the Storage Engine".

Functionality Added or Changed

- **Incompatible Change**: All numeric operators and functions on integer, floating-point and DECIMAL values now throw an "out of range" error (ER_DATA_OUT_OF_RANGE) rather than returning an incorrect value or NULL, when the result is out of the supported range for the corresponding data type. See Section 10.2.6, "Out-of-Range and Overflow Handling". (Bug #8433)
- **InnoDB Storage Engine**: The INFORMATION_SCHEMA.INNODB_TRX table now includes a number of fields that duplicate information from the SHOW ENGINE INNODB STATUS output. You no longer need to parse that output to get complete transaction information. (Bug #53336)
- **InnoDB Storage Engine**: InnoDB stores redo log records in a hash table during recovery. On 64-bit systems, this hash table was 1/8 of the buffer pool size. To reduce memory usage, the dimension of the hash table was reduced to 1/64 of the buffer pool size (or 1/128 on 32-bit systems). (Bug #53122)
- For events of MYSQL_AUDIT_GENERAL_CLASS, the event subclass was not passed to audit plugins even though the server passed the subclass to the plugin handler. The subclass is now available through the following changes:

  - The struct mysql_event_general structure has a new event_subclass member.
  - The new member changes the interface, so the audit plugin interface version, MYSQL_AUDIT_INTERFACE_VERSION, has been incremented from 0x0100 to 0x0200. Plugins that require access to the new member must be recompiled to use version 0x0200 or higher.

  The NULL_AUDIT example plugin in the plugin/audit_null directory has been modified to count events of each subclass, based on the event_subclass value. See Section 22.2.4.8, "Writing Audit Plugins". (Bug #47059)

- The `Rows_examined` value in slow query log rows now is nonzero for `UPDATE` and `DELETE` statements that modify rows. (Bug #49756)
- Previously, the `innodb_file_format_check` system variable served a dual purpose. Setting it at server startup would keep `InnoDB` from starting if any tables used a more recent file format than supported by the current level of `InnoDB`. If `InnoDB` could start, the same system variable was set to the "highest" file format value used by any `InnoDB` table in the database. Thus, its value could change from the value you specified.

  Now, checking and recording the file format tag are handled using separate variables. `innodb_file_format_check` can be set to 1 or 0 at server startup to enable or disable whether `InnoDB` checks the file format tag in the system tablespace. If the tag is checked and is higher than that supported by the current version of `InnoDB`, an error occurs and `InnoDB` does not start. If the tag is not higher, `InnoDB` sets the value of `innodb_file_format_max` to the file format tag.

  For background information about `InnoDB` file-format management, see Section 13.4.4, "InnoDB File-Format Management". (Bug #49792, Bug #53654)
- The deprecated `mysql_fix_privilege_tables` script has been removed. (Bug #42589)
- A new system variable, `skip_name_resolve`, is set from the value of the `--skip-name-resolve` server option. This provides a way to determine at runtime whether the server uses name resolution for client connections. (Bug #37168)
- Added the `SHA2()` function, which calculates the SHA-2 family of hash functions (SHA-224, SHA-256, SHA-384, and SHA-512). (Contributed by Bill Karwin) (Bug #13174)
- It is now possible to build MySQL on all platforms using `CMake` instead of the GNU autotools. (Prior to MySQL 5.5.5, `CMake` support was limited to Windows.) For instructions on using `CMake` to build MySQL, see Section 2.9, "Installing MySQL from Source".
- Windows MSI package installers create and set up the data directory that the installed server will use, but now also create a pristine "template" data directory named `data` under the installation directory. This directory can be useful when the machine will be used to run multiple instances of MySQL: After an installation has been performed using an MSI package, the template data directory can be copied to set up additional MySQL instances. See Section 5.6, "Running Multiple MySQL Instances on One Machine".

Bugs Fixed

- **Security Fix**: The server failed to check the table name argument of a `COM_FIELD_LIST` command packet for validity and compliance to acceptable table name standards. This could be exploited to bypass almost all forms of checks for privileges and table-level grants by providing a specially crafted table name argument to `COM_FIELD_LIST`.

  In MySQL 5.0 and above, this permitted an authenticated user with `SELECT` privileges on one table to obtain the field definitions of any table in all other databases and potentially of other MySQL instances accessible from the server's file system.

  Additionally, for MySQL version 5.1 and above, an authenticated user with `DELETE` or `SELECT` privileges on one table could delete or read content from any other table in all databases on this server, and potentially of other MySQL instances accessible from the server's file system. (Bug #53371, CVE-2010-1848)
- **Security Fix**: The server could crash if there were alternate reads from two indexes on a table using the `HANDLER` interface. (Bug #54007, CVE-2010-3681)
- **Security Fix**: Privilege checking for `UNINSTALL PLUGIN` was incorrect. (Bug #51770, CVE-2010-1621)
- **Security Fix**: The server could be tricked into reading packets indefinitely if it received a packet larger than the maximum size of one packet. (Bug #50974, CVE-2010-1849)
- **Security Fix**: The server was susceptible to a buffer-overflow attack due to a failure to perform bounds checking on the table name argument of a `COM_FIELD_LIST` command packet. By sending long data for the table name, a buffer is overflown, which could be exploited by an authenticated user to inject malicious code. (Bug #53237, CVE-2010-1850)
- **Security Fix**: `LOAD DATA INFILE` did not check for SQL errors and sent an OK packet even when errors were already reported. Also, an assert related to client/server protocol checking in debug servers sometimes was raised when it should not have been. (Bug #52512, CVE-2010-3683)
- **Security Fix**: Bug #52315 was fixed.
- **Security Fix**: Bug #53933 was fixed.
- **Security Fix**: Bug #53907 was fixed.

- **Security Fix**: Bug #48157 was fixed.
- **Security Fix**: Bug #52357 was fixed.
- **Performance**: **InnoDB Storage Engine**: Deadlock detection could be a bottleneck in `InnoDB` processing, if many transactions attempted to update the same row simultaneously. The algorithm has been improved to enhance performance and scalability, in the InnoDB Plugin for MySQL 5.1, and in InnoDB 1.1 for MySQL 5.5. (Bug #49047)
- **Performance**: While looking for the shortest index for a covering index scan, the optimizer did not consider the full row length for a clustered primary key, as in `InnoDB`. Secondary covering indexes are now preferred, making full table scans less likely. (Bug #39653)

  References: See also Bug #55656.
- **Incompatible Change**: `TRUNCATE TABLE` did not take an exclusive lock on a table if truncation was done by deleting all rows in the table. For `InnoDB` tables, this could break proper isolation because `InnoDB` ended up aborting some granted locks when truncating a table. Now an exclusive metadata lock is taken before `TRUNCATE TABLE` can proceed. This guarantees that no other transaction is using the table.

  Incompatible change: Truncation using delete no longer fails if `sql_safe_updates` is enabled (this was an undocumented side effect). (Bug #42643)
- **Incompatible Change**: After `SET TRANSACTION ISOLATION LEVEL` to set the isolation level for the next transaction, the session value of the `tx_isolation` system variable could appear to change to the transaction isolation level after completion of statements within the transaction. Now the current transaction isolation level is now established at transaction start. If there was a `SET TRANSACTION ISOLATION LEVEL statement`, the value is taken from it. Otherwise, the session `tx_isolation` value is used. A change in the session value while a transaction is active is still permitted, but no longer affects the current transaction isolation level. This is an incompatible change. A change in the session isolation level made while there is no active transaction overrides a `SET TRANSACTION ISOLATION LEVEL` statement, if there was any. (Bug #20837)
- **Important Change**: **Replication**: It was possible to set `sql_log_bin` with session scope inside a transaction or subquery. (Bug #53437)
- **Important Change**: **Replication**: When changing `binlog_format` or `binlog_direct_non_transactional_updates`, permissions were not checked prior to checking the scope and context of the variable being changed.

  As a result of this fix, an error is no longer reported when—in the context of a transaction or a stored function—you try to set a value for a session variable that is the same as its previous value, or for a variable whose scope is global only. (Bug #51277)
- **Important Change**: **Replication**: When invoked, `CHANGE MASTER TO` and `SET GLOBAL sql_slave_skip_counter` now cause information to be written to the error log about the slave's state prior to execution of the statement. For `CHANGE MASTER TO`, this information includes the previous values of `MASTER_HOST`, `MASTER_PORT`, `MASTER_LOG_FILE`, and `MASTER_LOG_POS`. For `SET GLOBAL sql_slave_skip_counter`, this information includes the previous values of `RELAY_LOG_FILE`, `RELAY_LOG_POS`, and `sql_slave_skip_counter`. (Bug #43406, Bug #43407)
- **Important Change**: When using fast `ALTER TABLE`, different internal ordering of indexes in the MySQL optimizer and the `InnoDB` storage engine could cause error messages about possibly mixed up `.frm` files and incorrect index use. (Bug #47622)
- **InnoDB Storage Engine**: **Replication**: Reading from a table that used a self-logging storage engine and updating a table that used a transactional engine (such as `InnoDB`) generated changes that were written to the binary log using statement format which could make slaves diverge. However, when using mixed logging format, such changes should be written to the binary log using row format. (This issue did not occur when reading from tables using a self-logging engine and updating `MyISAM` tables, as this was already handled by checking for combinations of nontransactional and transactional engines.) Now such statements are classified as unsafe, and in mixed mode, cause a switch to row-based logging. (Bug #49019)
- **InnoDB Storage Engine**: **Replication**: `TRUNCATE TABLE` performed on a temporary table using the `InnoDB` storage engine was logged even when using row-based mode. (Bug #51251)
- **InnoDB Storage Engine**: Some combinations of `SELECT` and `SELECT FOR UPDATE` statements could fail with errors about locks, or incorrectly release a row lock during a semi-consistent read operation. (Bug #53674)
- **InnoDB Storage Engine**: The server could crash with a message `InnoDB: Assertion failure in thread` *`nnnn`*, typically during shutdown on a Windows system. (Bug #53947)
- **InnoDB Storage Engine**: Adding a unique key on multiple columns, where one of the columns is `NULL`, could mistakenly report duplicate key errors. (Bug #53290)
- **InnoDB Storage Engine**: The server could crash during shutdown, if started with the option `-`

`-innodb_use_sys_malloc=0`. (Bug #52546)

- **InnoDB Storage Engine**: The values of `innodb_buffer_pool_pages_total` and `innodb_buffer_pool_pages_misc` in the `information_schema.global_status` table could be computed incorrectly. (Bug #52983)

- **InnoDB Storage Engine**: Multi-statement execution could fail with an error about foreign key constraints. This problem could affect calls to `mysql_query()` and `mysql_real_query()`, and `CALL` statements that invoke stored procedures. (Bug #48024)

- **InnoDB Storage Engine**: Fixed a checksum error reported for compressed tables when the `--innodb_checksums` option is enabled. Although the message stated that the table was corrupted, the table is actually fine. (Bug #53248)

- **InnoDB Storage Engine**: `InnoDB` checks to see whether a row could possibly exceed the maximum size if all columns are fully used. This produced `Row size too large` errors for some tables that could be created with the built-in `InnoDB` from older MySQL versions. Now the check is only done when `innodb_strict_mode` is enabled or if the table is dynamic or compressed. (Bug #50495)

- **InnoDB Storage Engine**: Connections waiting for an `InnoDB` row lock ignored `KILL` until the row lock wait ended. Now, `KILL` during lock wait results in "query interrupted" instead of "lock wait timeout exceeded". The corresponding transaction is rolled back. (Bug #51920)

- **InnoDB Storage Engine**: An overly strict assertion could fail during the purge of delete-marked records in `DYNAMIC` or `COMPRESSED` `InnoDB` tables that contain column prefix indexes. (Bug #52746)

- **InnoDB Storage Engine**: `InnoDB` attempted to choose off-page storage without ensuring that there was an "off-page storage" flag in the record header. To correct this, in `DYNAMIC` and `COMPRESSED` formats, `InnoDB` stores locally any non-`BLOB` columns having a maximum length not exceeding 256 bytes. This is because there is no room for the "external storage" flag when the maximum length is 255 bytes or less. This restriction trivially holds in `REDUNDANT` and `COMPACT` formats, because there `InnoDB` always stores locally columns having a length up to `local_len` = 788 bytes. (Bug #52745)

- **InnoDB Storage Engine**: `InnoDB` page splitting could enter an infinite loop for compressed tables. (Bug #52964)

- **InnoDB Storage Engine**: When reporting a foreign key constraint violation during `INSERT`, `InnoDB` could display uninitialized data for the `DB_TRX_ID` and `DB_ROLL_PTR` system columns. (Bug #53202)

- **InnoDB Storage Engine**: A mismatch between index information maintained within the `.frm` files and the corresponding information in the InnoDB system tablespace could produce this error: `[ERROR] Index index of table has n columns unique inside InnoDB, but MySQL is asking statistics for m columns. Have you mixed up .frm files from different installations?` (Bug #44571)

- **Partitioning**: **Replication**: Attempting to execute `LOAD DATA` on a partitioned `MyISAM` table while using statement-based logging mode caused the master to hang or crash. (Bug #51851)

- **Partitioning**: **Replication**: The `NO_DIR_IN_CREATE` server SQL mode was not enforced when defining subpartitions. In certain cases, this could lead to failures on replication slaves. (Bug #42954)

- **Partitioning**: Rows inserted into a table created using a `PARTITION BY LIST COLUMNS` option referencing multiple columns could be inserted into the wrong partition. (Bug #52815)

- **Partitioning**: When attempting to perform DDL on a partitioned table and the table's `.par` file could not be found, the server returned the inaccurate error message `Out of memory; restart server and try again (needed 2 bytes)`. Now in such cases, the server returns the error `Failed to initialize partitions from .par file`. (Bug #49161)

- **Partitioning**: `ALTER TABLE` statements that cause table partitions to be renamed or dropped (such as `ALTER TABLE ... ADD PARTITION`, `ALTER TABLE ... DROP PARTITION`, and `ALTER TABLE ... REORGANIZE PARTITION`) — when run concurrently with queries against the `INFORMATION_SCHEMA.PARTITIONS` table — could fail, cause the affected partitioned tables to become unusable, or both. This was due to the fact that the `INFORMATION_SCHEMA` database ignored the name lock imposed by the `ALTER TABLE` statement on the partitions affected. In particular, this led to problems with `InnoDB` tables, because `InnoDB` would accept the rename operation, but put it in a background queue, so that subsequent rename operations failed when `InnoDB` was unable to find the correct partition. Now, `INFORMATION_SCHEMA` honors name locks imposed by ongoing `ALTER TABLE` statements that cause partitions to be renamed or dropped. (Bug #50561)

  References: See also Bug #47343, Bug #45808.

- **Partitioning**: It was possible to execute a `CREATE TEMPORARY TABLE tmp LIKE pt` statement, where `pt` is a partitioned table, even though partitioned temporary tables are not permitted. This caused the server to crash. Now a check is performed to prevent such statements from being executed. (Bug #49477)

- **Partitioning**: Partition pruning on `RANGE` partitioned tables did not always work correctly; the last partition was not excluded if the range was beyond it (when not using `MAXVALUE`). Now the last partition is not included if the partitioning function value

is not within the range. (Bug #51830)

- **Partitioning**: Attempting to partition a table using a `DECIMAL` column caused the server to crash; this was not supported and is now specifically not permitted. (Bug #51347)

- **Partitioning**: The `insert_id` server system variable was not reset following an insert that failed on a partitioned `MyISAM` table having an `AUTO_INCREMENT` column. (Bug #50392)

- **Partitioning**: Foreign keys are not supported on partitioned tables. However, it was possible using an `ALTER TABLE` statement to set a foreign key on a partitioned table; it was also possible to partition a table with a single foreign key. (Bug #50104)

- **Partitioning**: `GROUP BY` queries performed poorly for some partitioned tables. This was due to the block size not being set for partitioned tables, thus the keys per block was not correct, which could cause such queries to be optimized incorrectly. (Bug #48229)

  References: See also Bug #37252.

- **Partitioning**: `REPAIR TABLE` failed for partitioned `ARCHIVE` tables. (Bug #46565)

- **Replication**: When using unique keys on `NULL` columns in row-based replication, the slave sometimes chose the wrong row when performing an update. This happened because a table having a unique key on such a column could have multiple rows containing `NULL` for the column used by the unique key, and the slave merely picked the first row containing `NULL` in that column. (Bug #53893)

- **Replication**: When a `CREATE TEMPORARY TABLE ... SELECT` statement was executed within a transaction that updated only transactional engines and was later rolled back (for example, due to a deadlock) the changes—including the creation of the temporary table—were not written to the binary log, which caused subsequent updates to this table to fail on the slave. (Bug #53421)

- **Replication**: DDL statements that lock tables (such as `ALTER TABLE`, `CREATE INDEX`, and `CREATE TRIGGER`) caused spurious `ER_BINLOG_ROW_MODE_AND_STMT_ENGINE` or `ER_BINLOG_STMT_MODE_AND_ROW_ENGINE` errors, even though they did not insert rows into any tables.

  > **Note**
  >
  > The error `ER_BINLOG_ROW_MODE_AND_STMT_ENGINE` is generated when `binlog_format=ROW` and a statement modifies a table restricted to statement-based logging; `ER_BINLOG_STMT_MODE_AND_ROW_ENGINE` is generated when `binlog_format=STATEMENT` and a statement modifies a table restricted to row-based logging.

  (Bug #50479)

  References: This bug was introduced by Bug #39934, Bug #11749859.

- **Replication**: In some cases, attempting to update a column with a value of an incompatible type resulted in a mismatch between master and slave because the column value was set to its implicit default value on the master (as expected), but the same column on the slave was set to `NULL`. (Bug #52868)

- **Replication**: When using a nontransactional table on the master with autocommit disabled, no `COMMIT` was recorded in the binary log following a statement affecting this table. If the slave's copy of the table used a transactional storage engine, the result on the slave was as though a transaction had been started, but never completed. (Bug #49522)

  References: See also Bug #29288.

- **Replication**: The failure of a `REVOKE` statement was logged with the wrong error code, causing replication slaves to stop even when the failure was expected on the master. (Bug #51987)

- **Replication**: A buffer overrun in the handling of `DATE` column values could cause `mysqlbinlog` to fail when reading logs containing certain combinations of DML statements on a table having a `DATE` column followed by dropping the table. (Bug #52202)

- **Replication**: When using the statement-based logging format, statements that used `CONNECTION_ID()` were always kept in the transaction cache; consequently, nontransactional changes that should have been flushed before the transaction were kept in the transaction cache. (Bug #53075)

  References: This bug was introduced by Bug #51894.

- **Replication**: When temporary tables were in use, switching the binary logging format from `STATEMENT` to `ROW` did not take effect until all temporary tables were dropped. (The existence of temporary tables should prevent switching the format only from `ROW` to `STATEMENT` from taking effect, not the reverse.) (Bug #52616)

- **Replication**: Issuing any DML on a temporary table `temp` followed by `DROP TEMPORARY TABLE temp`, both within the

same transaction, caused replication to fail.

The fix introduces a change to statement-based binary logging with respect to temporary tables. Within a transaction, changes to temporary tables are saved to the transaction cache and written to the binary log when the transaction commits. Otherwise, out-of-order logging of events could occur. This means that temporary tables are treated similar to transactional tables for purposes of caching and logging. This affects assessment of statements as safe or unsafe and the associated error message was changed from:

```
Unsafe statement written to the binary log using statement format
since BINLOG_FORMAT = STATEMENT. Statements that read from both
transactional and non-transactional tables and write to any of them
are unsafe.
```

To:

```
Unsafe statement written to the binary log using statement format
since BINLOG_FORMAT = STATEMENT. Statements that read from both
transactional (or a temporary table of any engine type) and
non-transactional tables and write to any of them are unsafe.
```

(Bug #51894)

References: See also Bug #51291, Bug #53075, Bug #53259, Bug #53452, Bug #54872. This bug was introduced by Bug #46364.

- **Replication**: Enabling `binlog_direct_non_transactional_updates` causes nontransactional changes to be written to the binary log upon committing the statement. However, even when not enabled, the addition of this variable introduced a number of undesired changes in behavior:

  1. When using `ROW` or `MIXED` logging mode: Nontransactional changes executed within a transaction prior to any transactional changes were written to the statement cache, but those following any transactional changes were written to the transactional cache instead, causing these (later) nontransactional changes to be lost.

  2. When using `ROW` or `MIXED` logging mode: When rolling back a transaction, any nontransactional changes that might be in the transaction cache were disregarded and truncated along with the transactional changes.

  3. When using `STATEMENT` logging mode: A statement that combined transactional and nontransactional changes prior to any other transactional changes within the transaction, but failed, was kept in the transactional cache until the transaction ended, rather than being written to the binary log at the instant of failure (and not deferred to the end of the transaction).

  These problems have been handled as follows:

  - The setting for `binlog_direct_non_transactional_updates` no longer has any effect when the value of `binlog_format` is either `ROW` or `MIXED`. This addresses the first two issues previously listed.

  - When using statement-based logging with `binlog_direct_non_transactional_updates` set to `ON`, any statement combining transactional and nontransactional changes within the same transaction is now stored in the transaction cache, whether or not it succeeds, and regardless of its order of execution among any transactional statements within that transaction. This means that such a statement is now written to the binary log only on transaction commit or rollback.

  (Bug #51291)

  References: This bug was introduced by Bug #46364.

- **Replication**: When run with the `--database` option, `mysqlbinlog` printed `ROLLBACK` statements but did not print any corresponding `SAVEPOINT` statements. (Bug #50407)

- **Replication**: When a `CREATE EVENT` statement was followed by an additional statement and the statements were executed together as a single statement, the `CREATE EVENT` statement was padded with “garbage” characters when written to the binary log. This led to a syntax error when the event was read from the log. (Bug #50095)

- **Replication**: The internal flag indicating whether a user value was signed or unsigned (`unsigned_flag`) could sometimes change between the time that the user value was recorded for logging purposes and the time that the value was actually written to the binary log, which could lead to inconsistency. Now `unsigned_flag` is copied when the user variable value is copied, and the copy of `unsigned_flag` is then used for logging. (Bug #51426, Bug #11759138)

  References: See also Bug #49562, Bug #11757508.

- **Replication**: When using temporary tables, the binary log needs to insert a pseudo-thread ID for threads that are using temporary tables, each time a switch happens between two threads, both of which are using temporary tables. However, if a thread issued a failing statement before exit, its ID was not recorded in the binary log, and this in turn caused the ID for the next thread that tried to do something with a temporary table not to be logged as well. Subsequent replays of the binary log failed with the

error `TABLE ... DOESN'T EXIST`. (Bug #51226)

References: This bug is a regression of Bug #35583.

- **Replication**: If the master was using `sql_mode='TRADITIONAL'`, duplicate key errors were not sent to the slave, which received `0` rather than the expected error code. This caused replication to fail even when such an error was expected. (Bug #51055)
- **Replication**: ACK packets in semisynchronous replication were not checked for length and malformed packets could cause a server crash. (Bug #52748)
- The `make_binary_distribution` target to `make` could fail on some platforms because the lines generated were too long for the shell. (Bug #54590)
- Builds of the embedded `mysqld` failed due to a missing element of the `struct NET`. (Bug #53908, Bug #53912)
- Certain path names passed to `LOAD_FILE()` could cause a server crash. (Bug #53417)
- `UPDATE` on an `InnoDB` table modifying the same index that was used to satisfy the `WHERE` condition could trigger a debug assertion under some circumstances. (Bug #53830)
- Valgrind warnings resulting from passing incomplete `DATETIME` values to the `TIMESTAMP()` function were corrected. (Bug #53942)
- Incorrect results could be returned for `LEFT JOIN` of `InnoDB` tables with an impossible `WHERE` condition. (Bug #53334)
- For single-table `DELETE` statements that used quick select and index scan simultaneously caused a server crash or assertion failure. (Bug #53450)
- MySQL incorrectly processed `ALTER DATABASE` `` `#mysql50#special` `` `UPGRADE DATA DIRECTORY NAME` where *`special`* was `.`, `..`, or a sequence starting with `./` or `../`. It used the server data directory (which contains other regular databases) as the database directory. (Bug #53804, CVE-2010-2008)
- `InnoDB` crashed when replacing duplicates in a table after a fast `ALTER TABLE` added a unique index. (Bug #53592)
- For `InnoDB` tables, the error handler for a fast `CREATE INDEX` did not reset the error state of the transaction before attempting to undo a failed operation, resulting in a crash. (Bug #53591)
- The definition of the `MY_INIT` macro in `my_sys.h` included an extraneous semicolon, which could cause compilation failure. (Bug #53906)
- `ALTER TABLE` for views is not legal but did not produce an error. (If you need to rename a view, use `RENAME TABLE`.) (Bug #53976)
- A crash occurred if a table that was locked with `LOCK TABLES` was listed twice in a `DROP TABLE` statement. (Bug #54282)
- `OPTIMIZE TABLE` could be run on a table in use by a transaction in a different session, causing repeatable read to break. (Bug #53798)
- Queries that used `MIN()` or `MAX()` on indexed columns could be optimized incorrectly. (Bug #53859)
- The `AND CHAIN` option for `COMMIT` and `ROLLBACK` failed to preserve the current transaction isolation level. Setting `completion_type` to 1 also failed to do so. (Bug #53343)
- Inconsistent checking of the relationship between `SHOW` statements and `INFORMATION_SCHEMA` queries caused such queries to fail sometimes. (Bug #54422)
- If the `completion_type` session variable was changed after a stored procedure or prepared statement had been cached, the change had no effect on subsequent executions of the procedure or statement. (Bug #53346)
- For updates to `InnoDB` tables, `TIMESTAMP` columns could be updated even when no values actually changed. (Bug #47453)
- A problem with equality propagation optimization for prepared statements and stored procedures caused a server crash upon re-execution of the prepared statement or stored procedure. (Bug #51650)

  References: See also Bug #8115, Bug #8849.
- Using `REPLACE` to update a previously inserted negative value in an `AUTO_INCREMENT` column of an `InnoDB` table caused the table auto-increment value to be updated to 2147483647. (Bug #47720)
- During MySQL server installation using the MSI package on Windows, the `default-character-set` option would be in-

cluded in the default configuration template file. This caused the MySQL server to fail to start properly. (Bug #52380)

- Executing a `LOAD XML INFILE` statement could sometimes lead to a server crash. (Bug #51571)
- A query that read from a derived table (of the form `SELECT ... FROM (SELECT ...)`) produced incorrect results when the following conditions were present:
  - The table subquery contained a derived query (`(SELECT ...) AS column`).
  - The derived query could potentially produce zero rows or a single `NULL` (that is, no rows matched, or the query used an aggregate function such as `SUM()` running over zero rows).
  - The table subquery joined at least two tables.
  - The join condition involved an index.

  (Bug #47904)
- A `HAVING` clause on a joined table in some cases failed to eliminate rows which should have been excluded from the result set. (Bug #51242)
- Performing a single in-place `ALTER TABLE` containing `ADD INDEX` and `DROP INDEX` options that used the same index name could result in a corrupt table definition file. Now such `ALTER TABLE` statements are no longer performed in place. (Bug #49838)
- The type inference used for view columns caused some columns in views to be handled as the wrong type, as compared to the same columns in base tables. `DATE` columns in base tables were treated as `TIME` columns in views, and base table `TIME` columns as view `DATETIME` columns. (Bug #50918)
- The `MERGE` engine failed to open a child table from a different database if the child table or database name contained characters that were subject to table name to file name encoding.

  Further, the `MERGE` engine did not properly open a child table from the same database if the child table name contained characters such as `'/'`, or `'#'`. (Bug #48265)
- `CHECKSUM TABLE` could compute the checksum for `BIT` columns incorrectly. (Bug #51304)
- `mysql_upgrade` did not detect when `CSV` log tables incorrectly contained columns that could be `NULL`. Now these columns are altered to be `NOT NULL`. (Bug #49823)
- The query shown by `EXPLAIN EXTENDED` plus `SHOW WARNINGS` could produce results different from the original query. (Bug #47669)
- Two sessions trying to set the global `event_scheduler` system variable to different values could deadlock. (Bug #51160)
- For LDML-defined collations, some data structures were not initialized properly to enable `UPPER()` and `LOWER()` to work correctly. (Bug #51976)
- Invalid memory reads occurred for `HANDLER ... READ NEXT` after a failed `HANDLER ... READ FIRST`. (Bug #51877)
- The `YEAR` values `2000` and `0000` could be treated as equal. (Bug #49910)
- The optimizer performed an incorrect join type when `COALESCE()` appeared within an `IN()` operation. (Bug #51598)
- Following a bulk insert into a `MyISAM` table, if `MyISAM` failed to build indexes using repair by sort, data file corruption could occur. (Bug #51307)
- With an XA transaction active, `SET autocommit = 1` could cause side effects such as memory corruption or a server crash. (Bug #51342)
- The optimization to read `MIN()` or `MAX()` values from an index did not properly handle comparisons with `NULL` values. This could produce incorrect results for `MIN()` or `MAX()` when the `WHERE` clause tested a `NOT NULL` column for `NULL`. (Bug #47762)
- Killing a query during the optimization phase of a subquery could cause a server crash. (Bug #47761)
- Setting `myisam_repair_threads` larger than 1 could result in the cardinality for all indexes of a `MyISAM` table being set to 1 after parallel index repair. (Bug #47444)
- Use of `HANDLER` statements with tables that had spatial indexes caused a server crash. (Bug #51357)

- The server crashed when it could not determine the best execution plan for queries involving outer joins with nondeterministic `ON` clauses such as the ones containing the `RAND()` function, a user-defined function, or a `NOT DETERMINISTIC` stored function. (Bug #48483)
- On Windows, `LOAD_FILE()` could cause a crash for some pathnames. (Bug #51893)
- If `myisam_sort_buffer_size` was set to a small value, table repair for `MyISAM` tables with `FULLTEXT` indexes could crash the server. (Bug #51866)
- `EXPLAIN EXTENDED` crashed trying to resolve references to freed temporary table columns for `GROUP_CONCAT() ORDER BY` arguments. (Bug #52397)
- In debug builds, if the listed columns in the view definition of the table used in an `INSERT ... SELECT` statement mismatched, an assertion was raised in the query cache invalidation code following the failing statement. (Bug #46615)
- The optimizer could attempt to evaluate the `WHERE` clause before any rows had been read, resulting in a server crash. (Bug #52177)
- `MyISAM` could write uninitialized data to new index pages. Now zeros are written to unused bytes in the pages. (Bug #47598)
- The server crashed when the optimizer attempted to determine constant tables but a table storage engine did not support exact record count. (Bug #51494)
- The server could crash populating the `INFORMATION_SCHEMA.PROCESSLIST` table due to lack of mutex protection. (Bug #51377)
- After `TRUNCATE TABLE` of a `MyISAM` table, subsequent queries could crash the server if `myisam_use_mmap` was enabled. (Bug #51868)
- Setting `@@GLOBAL.debug` to an empty string failed to clear the current debug settings. (Bug #52629)
- There was a race condition between flags used for signaling that a query was killed, which led to error-reporting and lock-acquisition problems. (Bug #52356)
- User-defined variables of type `REAL` that contained `NULL` were handled improperly when assigned to a column of another type. (Bug #50511)
- Stored routine DDL statements were written to the binary log using statement-based format regardless of the current logging format. (Bug #51839)
- With a non-`latin1` ASCII-based current character set, the server inappropriately converted `DATETIME` values to strings. This resulted in the optimizer not using indexes on such columns. (Bug #52849)
- `SHOW CREATE TABLE` was blocked if the table was write locked by another session. (Bug #52593)
- `mysql_upgrade` attempted to work with stored routines before they were available. (Bug #52444)
- A `COUNT(DISTINCT)` query on a view could cause a server crash. (Bug #51980)
- Corrupt `MyISAM` tables were automatically repaired even when `myisam_recover_options` was set to `OFF`. (Bug #51327)
- Two sessions trying to set the global `event_scheduler` system variable to `OFF` resulted in one of them hanging waiting for the event scheduler to stop. (Bug #52367)
- An assertion was raised as a result of a `NULL` string being passed to the `dtoa` code. (Bug #52165)
- `OPTIMIZE TABLE` for an `InnoDB` table could raise an assertion if another session issued a concurrent `DROP TABLE`. (Bug #47459)
- For debug builds, creating a view containing a subquery that might require collation adjustment caused an assertion to be raised. For example, this could occur if some items had different collations but the result collation could be adjusted to the one of them. (Bug #52120)
- Locking involving the `LOCK_plugin`, `LOCK_global_system_variables`, and `LOCK_status` mutexes could deadlock. (Bug #51591)
- `InnoDB` fast index creation could incorrectly use a table copy in some cases. (Bug #50946)
- If the server is started with `--skip-grant-tables`, plugin loading and unloading should be prohibited, but the server failed to reject `INSTALL PLUGIN` and `UNINSTALL PLUGIN` statements. (Bug #46261)

- On Windows, the server failed to find a description for Event ID 100. (Bug #48042)
- A syntactically invalid trigger could cause the server to crash when trying to list triggers. (Bug #50755)
- A memory leak occurred due to missing deallocation of the `comparators` array (a member of the `Arg_comparator` class). (Bug #52124)
- `EXPLAIN` could cause a server crash for some queries with subqueries. (Bug #48419)
- `mysqld_safe` set `plugin_dir` using a hardcoded default path name rather than a path depending on `basedir`. (Bug #52737)
- In MySQL 5.1, `READ COMMITTED` was changed to use less locking due to the availability of row-based binary logging (see the Note under `READ COMMITTED` at Section 12.3.6, "`SET TRANSACTION` Syntax"). However, `READ UNCOMMITTED` did not have the same change, so it was using more locks than the higher isolation level, which is unexpected. This was changed so that `READ UNCOMMITTED` now also uses the lesser amount of locking and has the same restrictions for binary logging. (Bug #48607)
- Semi-consistent read was implemented for `InnoDB` to address Bug #3300. Semi-consistent reads do not block when a non-matching record is already locked by some other transaction. If the record is not locked, a lock is acquired, but is released if the record does not match the `WHERE` condition. However, semi-consistent read was attempted even for `UPDATE` statements having a `WHERE` condition of the form `pk_col1=constant1, ..., pk_colN=constantN`. Some code failed that was designed with the assumption that semi-consistent read would be only attempted on table scans. (Bug #52663)
- `mysqld_safe` did not always pass `--open-files-limit` through to `mysqld`. `mysqld_safe` did not treat dashes and underscores as equivalent in option names. (Bug #47095)
- `mysqldump` and `SELECT ... INTO OUTFILE` truncated long `BLOB` and `TEXT` values to 766 bytes. (Bug #53088)
- Setting `--secure-file-priv` to the empty string left the value unaffected. (Bug #50373)
- In the debug version of the server, the `FreeState()` function could in some circumstances be called twice, leading to an assertion failure. (Bug #52884)
- Calculation of intervals for Event Scheduler events was not portable. (Bug #50087)
- A trigger could change the behavior of assigning `NULL` to a `NOT NULL` column. (Bug #48525)
- Selecting from `INFORMATION_SCHEMA.ROUTINES` or `INFORMATION_SCHEMA.PARAMETERS` resulted in a memory leak. (Bug #48729)
- Aggregate functions could incorrectly return `NULL` in outer join queries. (Bug #52051)
- The Loose Index Scan optimization method assumed that it could depend on the partitioning engine to maintain interval endpoint information, as if it were a storage engine. (Bug #50939)
- When the transaction isolation level was `REPEATABLE READ` and binary logging used statement or mixed format, `SELECT` statements with subqueries referencing `InnoDB` tables unnecessarily acquired shared locks on rows in these tables. (Bug #46947)
- On some systems, such as Mac OS X, the `sockaddr_in` and `sockaddr_in6` structures contain a non-standard field (`sin_len` / `sin6_len`) that must be set but was not. This resulted in hostname lookup failure. (Bug #52923)
- `gcc` 4.4.0 could fail to compile `dtoa.c`. (Bug #45882)
- Spurious duplicate-key errors occurred for multiple-column indexes on `BINARY` columns. (Bug #52430)
- Cast operations on `NULL DECIMAL` values could cause server crashes or Valgrind warnings. (Bug #52168)
- Operations on geometry data types failed on some systems for builds compiled with Sun Studio. (Bug #52208)
- Concurrent `SHOW COLUMNS` statements could cause a server crash. (Bug #52856)
- Previously, the server held a global mutex while performing file operations such as deleting an `.frm` or data file, or reading index statistics from a data file. Now the mutex is not held for these operations. Instead, the server uses metadata locks. (Bug #50589, Bug #51557, Bug #49463)
- The `Lock_time` value in the slow query log was negative for stored routines. (Bug #53191)
- For a concurrent load of 16 or more connections containing many `LOCK TABLES WRITE` statements for the same table, server throughput was significantly lower for MySQL 5.5.3 and 5.5.4 than for earlier versions (10%–40% lower depending on con-

currency). (Bug #52289)

- On Intel x86 machines, the optimizer could choose different execution plans for a query depending on the compiler version and optimization flags used to build the server binary. (Bug #48537)
- For outer joins, the optimizer could fail to properly calculate table dependencies. (Bug #52005)
- `ALTER TABLE` on `InnoDB` tables (including partitioned tables) acquired exclusive locks on rows of the table being altered. If there was a concurrent transaction that did locking reads from this table, this sometimes led to a deadlock that was not detected by the metadata lock subsystem or by InnoDB (and was reported only after exceeding `innodb_lock_wait_timeout`). (Bug #51263)
- The `length` and `max_length` metadata values were incorrect for columns with the `TEXT` family of data types that used multibyte character sets. This bug was introduced in MySQL 5.5.3. (Bug #52520)
- Setting the `innodb_change_buffering` system variable to `DEFAULT` produced an incorrect result. (Bug #53165)
- For the `COMMIT` and `ROLLBACK` statements, the `AND CHAIN` and `RELEASE` modifiers should be mutually exclusive, but the parser permitted both to be specified. (Bug #46527)
- The `check_table_is_closed()` debugging function did not protect access to the `MyISAM` open tables list, with the result that server crashes could occur during table drop or rename operations. (Bug #52432)
- `support-files/mysql.spec.sh` had unnecessary Perl dependencies. (Bug #49723)
- Setting the session value of the `debug` system variable also set the global value. (Bug #38054)
- `ALTER TABLE ... ADD COLUMN` for a table with multiple foreign keys caused a server crash. (Bug #45052)
- When using `UNINSTALL PLUGIN` to remove a loaded plugin, open tables and connections caused `mysqld` to hang until the open connections had been closed. (Bug #39053)
- `mysql_upgrade` did not create temporary files properly. (Bug #41057)
- It was possible for `DROP TABLE` of one `MyISAM` table to remove the data and index files of a different `MyISAM` table. (Bug #40980)
- If the arguments to a `CONCAT()` call included a local routine variable, selecting the return value into a user variable could produce an incorrect result. (Bug #40625)
- For a query that selected from a view and used an alias for the view, the metadata used the alias name rather than the view name in the `MYSQL_FIELD.table` member. (Bug #41788)
- `InnoDB` could fail to create a unique index on `NULL` columns. (Bug #41904)
- Using an initial command with `mysql_options(..., MYSQL_INIT_COMMAND, ...)` that generated multiple result sets (such as a stored procedure or a multi-statement command) left the connection unusable. (Bug #42373)
- Valgrind warnings in the `InnoDB` `compare_record()` function were corrected. (Bug #38999)
- Column names displayed from the `PARTITION_EXPRESSION` column of the `INFORMATION_SCHEMA.PARTITIONS` table did not include escape characters as necessary. (Bug #39338)
- The server could crash with an out of memory error when trying to parse a query that was too long to fit in memory. Now the parser rejects such queries with an `ER_OUT_OF_RESOURCES` error. (Bug #42064)
- The optimizer sometimes used `filesort` for `ORDER BY` when it should have used an index. (Bug #38745)
- When `SET TRANSACTION ISOLATION LEVEL` was used to set the isolation level for the next transaction, the level could persist for subsequent transactions. (Bug #39170)
- Manual pages for a few little-used programs were missing from RPM packages. (Bug #44370)
- Accessing a `MERGE` table with an empty underlying table list incorrectly resulted in a “wrong index” error message rather than “end of file.” (Bug #35274)
- `mysqld` could fail during execution when using SSL. (Bug #34236)
- A query on a `FEDERATED` table in which the data was ordered by a `TEXT` column returned incorrect results. For example, a query such as the following produced incorrect results if column `column1` was a `TEXT` column:

```
SELECT * FROM table1 ORDER BY column1;
```

(Bug #32426)

- The test for `readline` during configuration failed when trying to build MySQL in a directory other than the source tree root. (Bug #35250)
- MySQL Makefiles relied on GNU extensions. (Bug #30708)
- The behavior of the RPM installation for both new installations and upgrade installations has changed.

  During a new installation, the server boot scripts are installed, but the MySQL server is not started at the end of the installation, since the status of the system during an unattended installation is not known.

  During an upgrade installation using the RPM packages, if the server is running when the upgrade occurs, the server is stopped, the upgrade occurs, and server is restarted. If the server is not already running when the RPM upgrade occurs, the server is not started at the end of the installation.

  The boot scripts for MySQL are installed in the appropriate directories in `/etc`, so the MySQL server will be restarted automatically at the next machine reboot. (Bug #27072)
- The parser allocated too much memory for a query string containing multiple statements. (Bug #27863)
- `ROW_COUNT()` returned a meaningful value only for some DML statements. Now it returns a value as follows:
  - DDL statements: 0. This applies to statements such as `CREATE TABLE` or `DROP TABLE`.
  - DML statements other than `SELECT`: The number of affected rows. This applies to statements such as `UPDATE`, `INSERT`, or `DELETE` (as before), but now also to statements such as `ALTER TABLE` and `LOAD DATA INFILE`.
  - `SELECT`: -1 if the statement returns a result set, or the number of rows "affected" if it does not. For example, for `SELECT * FROM t1`, `ROW_COUNT()` returns -1. For `SELECT * FROM t1 INTO OUTFILE 'file_name'`, `ROW_COUNT()` returns the number of rows written to the file.
  - `SIGNAL` statements: 0.

  (Bug #21818)

D.1.19. Changes in MySQL 5.5.4 (09 April 2010)

InnoDB Notes

- `InnoDB` has been upgraded to version 1.1. This version is considered of Beta quality.

  For information about `InnoDB` features, see Section 13.4, "New Features of InnoDB 1.1". For general information about using `InnoDB` in MySQL, see Section 13.3, "The `InnoDB` Storage Engine".

RPM Notes

- `debuginfo` RPM packages are no longer being built or published.

Functionality Added or Changed

- **InnoDB Storage Engine**: `InnoDB` now has a `innodb_use_native_aio` system variable that can be disabled at startup if there is a problem with the asynchronous I/O subsystem in the OS. This variable applies to Linux systems only, where the MySQL server now has a dependency on the `libaio` library.

Bugs Fixed

- **Performance**: **InnoDB Storage Engine**: The redo scan during `InnoDB` recovery used excessive CPU. The efficiency of this scan was improved, significantly speeding up crash recovery. (Bug #49535, Bug #29847)
- **Performance**: **InnoDB Storage Engine**: `InnoDB` page-freeing operations were made faster for compressed blocks, speeding up `ALTER TABLE`, `DROP TABLE`, and other operations on compressed tables that free compressed blocks. One symptom of

the older behavior could be 100% CPU use during these operations. (Bug #35077)

- **InnoDB Storage Engine**: The AIX implementation of `readdir_r()` caused `InnoDB` errors. (Bug #50691)
- **InnoDB Storage Engine**: The limit of 1023 concurrent data-modifying transactions has been raised. The limit is now 128 × 1023 concurrent transactions that generate undo records. You can remove any workarounds that require changing the proper structure of your transactions, such as committing more frequently or delaying DML operations to the end of a transaction. See Section 13.4.7.19, "Better Scalability with Multiple Rollback Segments". (Bug #26590)
- `InnoDB` did not reset table `AUTO_INCREMENT` values to the last used values after a server restart. (Bug #49032)
- A unique index on a column prefix could not be upgraded to a primary index even if there was no primary index already defined. (Bug #51378)
- When using the `EXAMPLE` storage engine, when the engine had been built as a plugin (instead of built in), and DTrace probes had been enabled during the build, loading the storage engine library failed due to a missing object table entry.

D.1.20. Changes in MySQL 5.5.3 (24 March 2010, Milestone 3)

InnoDB Notes

- This release includes `InnoDB` 1.0.6. This version is considered of Release Candidate (RC) quality.

Performance Schema Notes

- MySQL Server now includes the Performance Schema, a feature for monitoring server execution at a low level. The implementation uses the `PERFORMANCE_SCHEMA` storage engine and the `performance_schema` database. The Performance Schema focuses primarily on performance data. This differs from `INFORMATION_SCHEMA`, which serves for inspection of metadata. For more information, see Chapter 20, *MySQL Performance Schema*.

  Performance Schema support is included in binary MySQL distributions but is disabled by default. To enable it, start the server with the `--performance_schema` option.

  To create the `performance_schema` database if you are upgrading from an earlier release, run `mysql_upgrade` and restart the server. See Section 4.4.7, "`mysql_upgrade` — Check Tables for MySQL Upgrade".

Functionality Added or Changed

- **Performance**: The performance of internal functions that trim multiple spaces from strings when comparing them has been improved. (Bug #14637)
- **Incompatible Change**: `CREATE VIEW` and `DROP VIEW` now are prohibited while a `LOCK TABLES` statement is in effect. (Bug #56571)
- **Incompatible Change**: The following obsolete constructs have been removed. Where alternatives are shown, applications should be updated to use them.
  - The `log_bin_trust_routine_creators` system variable (use `log_bin_trust_function_creators`).
  - The `myisam_max_extra_sort_file_size` system variable.
  - The `record_buffer` system variable (use `read_buffer_size`).
  - The `sql_log_update` system variable.
  - The `table_type` system variable (use `storage_engine`).
  - The `FRAC_SECOND` modifier for the `TIMESTAMPADD()` function (use `MICROSECOND`).
  - The `TYPE` table option to specify the storage engine for `CREATE TABLE` or `ALTER TABLE` (use `ENGINE`).
  - The `SHOW TABLE TYPES` SQL statement (use `SHOW ENGINES`).
  - The `SHOW INNODB STATUS` and `SHOW MUTEX STATUS` SQL statements (use `SHOW ENGINE INNODB STATUS` `SHOW ENGINE INNODB MUTEX`).

- The `SHOW PLUGIN` SQL statement (use `SHOW PLUGINS`).
- The `LOAD TABLE ... FROM MASTER` and `LOAD DATA FROM MASTER` SQL statements (use `mysqldump` or `mysqlhotcopy` to dump tables and `mysql` to reload dump files).
- The `BACKUP TABLE` and `RESTORE TABLE` SQL statements (use `mysqldump` or `mysqlhotcopy` to dump tables and `mysql` to reload dump files).
- `TIMESTAMP(N)` data type: The ability to specify a display width of *`N`* (use without *`N`*).
- The `--default-character-set` and `--default-collation` server options (use `--character-set-server` and `--collation-server`).
- The `--delay-key-write-for-all-tables` server option (use `--delay-key-write=ALL`).
- The `--enable-locking` and `--skip-locking` server options (use `--external-locking` and `--skip-external-locking`).
- The `--log-bin-trust-routine-creators` server option (use `--log-bin-trust-function-creators`).
- The `--log-long-format` server option.
- The `--log-update` server option.
- The `--master-`*`xxx`* server options to set replication parameters (use the `CHANGE MASTER TO` statement instead): `--master-host`, `--master-user`, `--master-password` , `--master-port`, `--master-connect-retry`, `--master-ssl`, `--master-ssl-ca`, `--master-ssl-capath`, `--master-ssl-cert`, `--master-ssl-cipher`, `--master-ssl-key`.
- The `--safe-show-database` server option.
- The `--skip-symlink` and `--use-symbolic-links` server options (use `--skip-symbolic-links` and `--symbolic-links`).
- The `--sql-bin-update-same` server option.
- The `--warnings` server option (use `--log-warnings`).
- The `--no-named-commands` option for `mysql` (use `--skip-named-commands`).
- The `--no-pager` option for `mysql` (use `--skip-pager`).
- The `--no-tee` option for `mysql` (use `--skip-tee`).
- The `--position` option for `mysqlbinlog` (use `--start-position`).
- The `--all` option for `mysqldump` (use `--create-options`).
- The `--first-slave` option for `mysqldump` (use `--lock-all-tables`).
- The `--config-file` option for `mysqld_multi` (use `--defaults-extra-file`).
- The `--set-variable=`*`var_name=value`* and `-O` *`var_name=value`* general-purpose options for setting program variables (use `--`*`var_name=value`*).

(Bug #48048)

References: See also Bug #47974, Bug #56408.

- **Incompatible Change**: Aliases for wildcards (as in `SELECT t.* AS 'alias' FROM t`) are no longer accepted and result in an error. Previously, such aliases were ignored silently. (Bug #27249)
- **Incompatible Change**: Several columns were added to the `INFORMATION_SCHEMA.ROUTINES` table to provide information about the `RETURNS` clause data type for stored functions: `DATA_TYPE`, `CHARACTER_MAXIMUM_LENGTH`, `CHARACTER_OCTET_LENGTH`, `NUMERIC_PRECISION`, `NUMERIC_SCALE`, `CHARACTER_SET_NAME`, and `COLLATION_NAME`.

  This change produces an incompatibility for applications that depend on column order in the `ROUTINES` table because the new columns appear between the `ROUTINE_TYPE` and `DTD_IDENTIFIER` columns. Such applications may need to be adjusted to account for the new columns.
- **Incompatible Change**: The Unicode implementation has been extended to provide support for supplementary characters that

lie outside the Basic Multilingual Plane (BMP). Noteworthy features:

- `utf16` and `utf32` character sets have been added. These correspond to the UTF-16 and UTF-32 encodings of the Unicode character set, and they both support supplementary characters.
- The `utf8mb4` character set has been added. This is similar to `utf8`, but its encoding allows up to four bytes per character to enable support for supplementary characters.
- The `ucs2` character set is essentially unchanged except for the inclusion of some newer BMP characters.

In most respects, upgrading to MySQL 5.5 should present few problems with regard to Unicode usage, although there are some potential areas of incompatibility. These are the primary areas of concern:

- For the variable-length character data types (`VARCHAR` and the `TEXT` types), the maximum length in characters is less for `utf8mb4` columns than for `utf8` columns.
- For all character data types (`CHAR`, `VARCHAR`, and the `TEXT` types), the maximum number of characters that can be indexed is less for `utf8mb4` columns than for `utf8` columns.

Consequently, if you want to upgrade tables from `utf8` to `utf8mb4` to take advantage of supplementary-character support, it may be necessary to change some column or index definitions.

For additional details about the new Unicode character sets and potential incompatibilities, see Section 9.1.10, “Unicode Support”, and Section 9.1.11, “Upgrading from Previous to Current Unicode Support”.

- **Incompatible Change**: The server now includes `dtoa`, a library for conversion between strings and numbers by David M. Gay. In MySQL, this library provides the basis for improved conversion between string or `DECIMAL` values and approximate-value (`FLOAT`/`DOUBLE`) numbers:

  - Consistent conversion results across platforms, which eliminates, for example, Unix versus Windows conversion differences.
  - Accurate representation of values in cases where results previously did not provide sufficient precision, such as for values close to IEEE limits.
  - Conversion of numbers to string format with the best possible precision. The precision of `dtoa` is always the same or better than that of the standard C library functions.

  Because the conversions produced by this library differ in some cases from previous results, the potential exists for incompatibilities in applications that rely on previous results. For example, applications that depend on a specific exact result from previous conversions might need adjustment to accommodate additional precision.

  For additional information about the properties of `dtoa` conversions, see Section 11.2, “Type Conversion in Expression Evaluation”.

  References: See also Bug #12860, Bug #21497, Bug #26788, Bug #24541, Bug #34015.

- **Incompatible Change**: Several changes were made to processing of server system variables and command-line options to make their treatment more consistent.

  General changes:

  - The help message text displayed by `mysqld --verbose --help` now consistently uses dashes to show the names of options and system variables that can be set at server startup. Previously, the message used both dashes and underscores (generally with dashes for options and underscores for system variables). For example, the help message now displays `--log-output` and `--general-log`, whereas previously it displayed `--log-output` and `--general_log`.

    This is a display-only change. The permissible syntax for setting options and variables remains unchanged:

    - At server startup, you can specify options and variables on the command line or in option files using either dashes or underscores.
    - For those system variables that can be set at runtime (for example, using `SET`), you must specify them using underscores.

  - There are fewer session-only system variables. These variables now have a global value: `autocommit`, `foreign_key_checks`, `profiling`, `sql_auto_is_null`, `sql_big_selects`, `sql_buffer_result`, `sql_log_bin`, `sql_log_off`, `sql_notes`, `sql_quote_show_create`, `sql_safe_updates`, `sql_warnings`, `unique_checks`.

    For those variables, you can now set the global value to change the value from which the session value is initialized for new

sessions.

The following list shows the variables that remain session-only. They apply only in the context of a specific session so that a global value is of no use: `debug_sync`, `error_count`, `identity`, `insert_id`, `last_insert_id`, `pseudo_thread_id`, `rand_seed1`, `rand_seed2`, `timestamp`, `warning_count`.

- All system variables are accessible at runtime using `@@` syntax (`@@GLOBAL.var_name`, `@@SESSION.var_name`, `@@var_name`). Previously, this syntax produced an error for some variables.
- All system variables are included as appropriate in the output from `SHOW {GLOBAL, SESSION} VARIABLES` and the `INFORMATION_SCHEMA.GLOBAL_VARIABLES` and `INFORMATION_SCHEMA.SESSION_VARIABLES` tables. Previously, some variables were not displayed.
- "As appropriate" in the preceding item means that `SHOW GLOBAL VARIABLES` and `INFORMATION_SCHEMA.GLOBAL_VARIABLES` no longer include session-only system variables. Previously, these included the global value of a variable if it had one, and the session value if not. (`SHOW SESSION VARIABLES` still includes global-only variables.)
- The server now enforces type checking for assignments to system variables, so it is more consistent and strict about rejecting invalid values.
- For attempts to assign a negative value to an unsigned system variable, the server truncates the value to the minimum permitted value. Previously, there was sometimes wraparound to a large positive value.
- Some system variables (typically those that control memory or disk allocation) are permitted to take only values that are a multiple of a given block size, and assigning a value not a block size multiple causes truncation to the nearest multiple. (For example, `net_buffer_length` must be a multiple of 1024. Assigning 16384 results in a value of 16384, whereas assigning 16383 results in a value of 15360.) A warning now occurs when adjustment of the specified value takes place. Previously, adjustment was silent.
- More system variables can be assigned the value `DEFAULT` to set them to their default value. Previously, this syntax produced an error in some cases.
- All variables that have a `SET` data type value can be set to an integer value that is treated like a bit mask. Previously, this did not work for some SET-type variables.
- The default value for several system variables no longer differs between 32-bit and 64-bit builds. Previously, the values differed by about 100 bytes for some variables.
- There are no longer any write-only system variables. For example, `SELECT @@rand_seed1` returns 0, not `Variable 'rand_seed1' can only be set, not read`.

Variable-specific changes:

- The `concurrent_insert` system variable now is handled as an enumeration with the permissible values `NEVER`, `AUTO`, and `ALWAYS`. The corresponding integer values 0, 1, and 2 are still recognized.
- The `completion_type` system variable now is handled as an enumeration with the permissible values `NO_CHAIN`, `CHAIN`, and `RELEASE`. The corresponding integer values 0, 1, and 2 are still recognized.
- For `concurrent_insert` and `completion_type`, the string form of the value is displayed by `SHOW VARIABLES` and `SELECT @@var_name`.
- The unused `rpl_recovery_rank` system variable is deprecated.
- The `storage_engine` system variable is deprecated in favor of the new system variable `default_storage_engine`. This enables pairing of the `--default-storage-engine` command-line option with a system variable of a more closely corresponding name.
- The `--myisam-recover` option is renamed to `--myisam-recover-options` to pair better with the name of the `myisam_recover_options` system variable. The old option name still works because it is recognized as an unambiguous prefix of the new name. (Option prefix recognition occurs as described in Section 4.2.3, "Specifying Program Options".)
- `--myisam-recover-options` has a new permissible value `OFF`.
- Attempts to drop the default key cache produce an error. Previously, it produced only a warning and status of success even though the attempt failed.

References: See also Bug #34437, Bug #34635, Bug #11747961, Bug #34829, Bug #34878, Bug #25430.

- **Incompatible Change**: Implicit conversion of a number or temporal value to string now produces a value that has a character set and collation determined by the `character_set_connection` and `collation_connection` system variables. (These variables commonly are set with `SET NAMES`. For information about connection character sets, see Section 9.1.4, "Connection Character Sets and Collations".)

  This change means that such a conversion results in a character (nonbinary) string (a `CHAR`, `VARCHAR`, or `LONGTEXT` value), except when the connection character set is set to `binary`. In that case, the conversion result is a binary string (a `BINARY`, `VARBINARY`, or `LONGBLOB` value).

  Previously, an implicit conversion always produced a binary string, regardless of the connection character set. Such implicit conversions to string typically occur for functions that are passed numeric or temporal values when string values are more usual, and thus could have effects beyond the type of the converted value. Consider the expression `CONCAT(1, 'abc')`. The numeric argument `1` was converted to the binary string `'1'` and the concatenation of that value with the nonbinary string `'abc'` produced the binary string `'1abc'`.

  This change in conversion behavior affects several functions that expect string arguments because a numeric or temporal argument converted to a string now results in a character rather than binary string argument:

  - String functions: `CONCAT()`, `CONCAT_WS()`, `ELT()`, `EXPORT_SET()`, `INSERT()`, `LCASE()`, `LEFT()`, `LOWER()`, `LPAD()`, `LTRIM()`, `MID()`, `QUOTE()`, `REPEAT()`, `REPLACE()`, `REVERSE()`, `RIGHT()`, `RPAD()`, `RTRIM()`, `SOUNDEX()`, `SUBSTRING()`, `TRIM()`, `UCASE()`, `UPPER()`.
  - Date and time functions: `ADDDATE()`, `ADDTIME()`, `DATE_ADD()`, `DATE_SUB()`, `DAYNAME()`, `GET_FORMAT()`, `MONTHNAME()`, `SUBDATE()`, `SUBTIME()`, `TIMESTAMPADD()`.

  These functions remain unaffected:

  - `CHAR()` without a `USING` clause still returns `VARBINARY`.
  - Functions that previously returned `utf8` strings still do so. Examples include `CHARSET()` and `COLLATION()`.

  Encryption and compression functions that expect string arguments and previously returned binary strings are affected depending on the content of the return value:

  - If the return value contains only ASCII characters, the function now returns a character string with the connection character set and collation: `MD5()`, `OLD_PASSWORD()`, `PASSWORD()`, `SHA()`, `SHA1()`. The `ASTEXT()` and `ASWKT()` spatial functions also fall into this category.
  - If the return value can contain non-ASCII characters, the function still returns a binary string: `AES_ENCRYPT()`, `COMPRESS()`, `DES_ENCRYPT()`, `ENCODE()`, `ENCRYPT()`.

  The `INET_NTOA()` return value contains only ASCII characters, and this function now returns a character string with the connection character set and collation rather than a binary string.

- **Important Change**: **Replication**: `RESET MASTER` and `RESET SLAVE` now reset the values shown for `Last_IO_Error`, `Last_IO_Errno`, `Last_SQL_Error`, and `Last_SQL_Errno` in the output of `SHOW SLAVE STATUS`. (Bug #34654)

  References: See also Bug #44270.

- **Important Change**: The `--skip-thread-priority` option is now deprecated such that the server will not change the thread priorities by default. Giving threads different priorities might yield marginal improvements in some platforms (where it actually works), but it might instead cause significant degradation depending on the thread count and number of processors. Meddling with the thread priorities is a not a safe bet as it is very dependent on the behavior of the CPU scheduler and system where MySQL is being run. (Bug #35164, Bug #37536)

- **Cluster Replication**: **Replication**: MySQL Replication now supports attribute promotion and demotion for row-based replication between columns of different but similar types on the master and the slave. For example, it is possible to promote an `INT` column on the master to a `BIGINT` column on the slave, and to demote a `TEXT` column to a `VARCHAR` column.

  The implementation of type demotion distinguishes between lossy and non-lossy type conversions, and their use on the slave can be controlled by setting the `slave_type_conversions` global server system variable.

  For more information, see Row-based replication: attribute promotion and demotion. (Bug #47163, Bug #46584)

- **Replication**: For replication based on row-based and mix-format binary logging, it is now safe to mix transactional and nontransactional statements within a transaction. The nontransactional statements are logged immediately rather than waiting until the transaction ends, ensuring that their results are logged and replicated correctly regardless of the result of the transaction.

- `SHOW PROFILE CPU` has been ported to Windows. Thanks to Alex Budovski for the patch. (Bug #50057)
- `mysqltest` has a new `--max-connections` option to set a higher number of maximum permitted server connections than the default 128. This option can also be passed using `mysql-test-run.pl`. (Bug #51135)
- `mysql-test-run.pl` has a new `--portbase` option and a corresponding `MTR_PORT_BASE` environment variable for setting the port range, as an alternative to the existing `--build-thread` option. (Bug #50182)
- `mysql-test-run.pl` now has a `--gprof` option that runs the server through the `gprof` profiler, much the same way the currently supported `--gcov` option runs it through `gcov`. (Bug #49345)
- `mysqltest` now has a `lowercase_result` command that converts the output of the next statement to lowercase. This is useful for test cases where the lettercase may vary between platforms. (Bug #48863)
- MySQL support for adding collations using LDML specifications did not support the `<i>` identity rule that indicates one character sorts identically to another. The `<i>` rule now is supported. See Section 9.4.4.2, “LDML Syntax Supported in MySQL”. (Bug #37129)
- `mysqltest` now has a `remove_files_wildcard` command that removes files matching a pattern from a directory. (Bug #39774)
- For boolean options, the option-processing library now prints additional information in the `--help` message: If the option is enabled by default, the message says so and indicates that the `--skip` form of the option disables the option. This affects all compiled MySQL programs that use the library. (Bug #35224)
- The use of the `SQL_CACHE` and `SQL_NO_CACHE` options in `SELECT` statements now is checked more restrictively: 1) Previously, both options could be given in the same statement. This is no longer true; only one can be given. 2) Previously, these options could be given in `SELECT` statements that were not at the top-level. This is no longer true; the options are not permitted in subqueries (including subqueries in the `FROM` clause, and `SELECT` statements in unions other than the first `SELECT`. (Bug #35020)
- The `mysql` client now has an `--auto-vertical-output` option, which causes result sets to be displayed vertically if they are too wide for the current window, and uses normal tabular format otherwise. (This applies to statements terminated by `;` or `\G`.) (Bug #26780)
- `TRUNCATE TABLE` now is permitted for a table for which a `WRITE` lock has been acquired with `LOCK TABLES`. (Bug #20667)

  References: See also Bug #46452.
- `FLUSH LOGS` now takes an optional *`log_type`* value so that `FLUSH log_type LOGS` can be used to flush only a specified log type. These *`log_type`* options are permitted:

  - `BINARY` closes and reopens the binary log files.
  - `ENGINE` closes and reopens any flushable logs for installed storage engines.
  - `ERROR` closes and reopens the error log file.
  - `GENERAL` closes and reopens the general query log file.
  - `RELAY` closes and reopens the relay log files.
  - `SLOW` closes and reopens the slow query log file.

  Thanks to Eric Bergen for the patch to implement this feature. (Bug #14104)
- Three options were added to `mysqldump` make it easier to generate a dump from a slave server:

  - `--dump-slave` is similar to `--master-data`, but the `CHANGE MASTER TO` statement contains binary log coordinates for the slave's master host, not the slave itself.
  - `--apply-slave-statements` causes `STOP SLAVE` and `START SLAVE` statements to be added before the `CHANGE MASTER TO` statement and at the end of the output, respectively.
  - `--include-master-host-port` causes the `CHANGE MASTER TO` statement to include `MASTER_PORT` and `MASTER_HOST` options for the slave's master.

  (Bug #8368)
- Previously, prepared `CALL` statements could be used through the C API only for stored procedures that produce at most one

result set, and applications could not use placeholders for `OUT` or `INOUT` parameters. For prepared `CALL` statements used using `PREPARE` and `EXECUTE`, placeholders could not be used for `OUT` or `INOUT` parameters.

For the C API, prepared `CALL` support now is expanded in the following ways:

- A stored procedure can produce any number of result sets. The number of columns and the data types of the columns need not be the same for all result sets.
- The final values of `OUT` and `INOUT` parameters are available to the calling application after the procedure returns. These parameters are returned as an extra single-row result set following any result sets produced by the procedure itself. The row contains the values of the `OUT` and `INOUT` parameters in the order in which they are declared in the procedure parameter list.
- A new C API function, `mysql_stmt_next_result()`, is available for processing stored procedure results. See Section 21.9.16, “C API Support for Prepared CALL Statements”.
- The `CLIENT_MULTI_RESULTS` flag now is enabled by default. It no longer needs to be enabled when you call `mysql_real_connect()`. (This flag is necessary for executing stored procedures because they can produce multiple result sets.)

For `PREPARE` and `EXECUTE`, placeholder support for `OUT` and `INOUT` parameters is now available. See Section 12.2.1, “CALL Syntax”. (Bug #11638, Bug #17898)

- `mysqladmin` now permits the password value to be omitted following the `password` command. In this case, `mysqladmin` prompts for the password value, which enables you to avoid specifying the password on the command line. Omitting the password value should be done only if `password` is the final command on the `mysqladmin` command line. Otherwise, the next argument is taken as the password. (Bug #5724)
- MySQL now supports IPv6 connections to the local host, using the address `::1`. For example:

```
shell> mysql -h ::1
```

The address `::1` can be specified in account names in statements such as `CREATE USER`, `GRANT`, and `REVOKE`. For example:

```
mysql> CREATE USER 'bill'@'::1' IDENTIFIED BY 'secret';
mysql> GRANT SELECT ON mydb.* TO 'bill'@'::1';
```

The default set of accounts created during MySQL installation now includes an account for `'root'@'::1'`.

See Section 5.4.3, “Specifying Account Names”, and Section 2.10.2, “Securing the Initial MySQL Accounts”. (Bug #8836)

- The maximum length of table comments was extended from 60 to 2048 characters. The maximum length of column comments was extended from 255 to 1024 characters. Index definitions now can include a comment of up to 1024 characters.
- Added the `PARAMETERS` table to `INFORMATION_SCHEMA`. The `PARAMETERS` table provides information about stored procedure and function parameters, and about return values for stored functions.
- The `TABLESPACES` table has been added to `INFORMATION_SCHEMA` for tracking tablespace details.
- When the server detects `MyISAM` table corruption, it now writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: `Got an error from thread_id=1, mi_dynrec.c:368`. This is useful information to include in bug reports.
- Some conversions between Japanese character sets are more efficient.
- The server now provides a pluggable audit interface that enables information about server operations to be reported to interested parties. Audit plugins may register with the audit interface to receive notification about server operations. When an auditable event occurs within the server, the server determines whether notification is needed. For each registered audit plugin, the server checks the event against those event classes in which the plugin is interested and passes the event to the plugin if there is a match. For more information, see Section 22.2.3.6, “Audit Plugins”.
- The `optimizer_switch` system variable now has an `engine_condition_pushdown` flag to control whether storage engine condition pushdown optimization is used. As a consequence, the `engine_condition_pushdown` system variable now is deprecated.
- Code that produces query IDs and updates the value of the `Threads_running` status variable no longer acquires a global lock that also protects the list of all connections. Instead, it relies on atomic increment and decrement instructions. This improves scalability and to a certain extent alleviates the problem described in Bug #11751904.

References: See also Bug #42930.

Bugs Fixed

- **Security Fix**: The server crashed if an account with the `CREATE ROUTINE` privilege but not the `EXECUTE` privilege attempted to create a stored procedure. (Bug #44798)

- **Security Enhancement**: When the `DATA DIRECTORY` or `INDEX DIRECTORY` clause of a `CREATE TABLE` statement referred to a subdirectory of the data directory through a symlinked component of the data directory path, it was accepted, when for security reasons it should be rejected. (Bug #39277)

- **Performance**: **Replication**: When writing events to the binary log, transactional events (that is, events that operate on transactional tables) are written to a thread-specific transaction cache, which is then written to the binary log on commit. To handle nontransactional events, there was a lock taken on the binary log (when entering the function `MYSQL_BIN_LOG::write()`), even when the event was written to the transaction cache instead of the binary log, causing a major bottleneck in replication performance. (Bug #42757)

- **Incompatible Change**: **Replication**: The `binlog_format` system variable can no longer be set inside a transaction. In other words, the binary logging format can no longer be changed while a transaction is in progress. (Bug #47863)

- **Incompatible Change**: **Replication**: Concurrent statements using a stored function and `DROP FUNCTION` for that function could break statement-based replication.

  DDL statements for stored procedures and functions are now prohibited while a `LOCK TABLES` statement is in effect. (Bug #30977)

  References: See also Bug #57663.

- **Incompatible Change**: A deadlock occurred for this sequence of events: Session 1 locked a table using `LOCK TABLES`; Session 2 dropped the database containing the table; Session 1 created any database.

  As a consequence of this bug fix, `CREATE DATABASE` is not permitted within a session that has an active `LOCK TABLES` statement. (Bug #49988)

- **Incompatible Change**: For debug builds, attempts to execute `RESET` statements within a transaction that had acquired metadata locks led to an assertion failure.

  As a result of this bug fix, `RESET` statements now cause an implicit commit. (Bug #51336)

- **Incompatible Change**: For application compatibility reasons, when `sql_auto_is_null` is 1, MySQL converts *`auto_inc_col`* `IS NULL` to *`auto_inc_col`* `= LAST_INSERT_ID()`. However, this was being done regardless of whether the predicate was alone or at the top level. Now it occurs only when it is a single top-level predicate.

  In conjunction with this bug fix, the default value of the `sql_auto_is_null` system variable has been changed from 1 to 0, which may cause incompatibilities with existing applications. (Bug #41371)

- **Incompatible Change**: `CREATE TABLE` statements (including `CREATE TABLE ... LIKE`) are now prohibited whenever a `LOCK TABLES` statement is in effect.

  One consequence of this change is that `CREATE TABLE ... LIKE` makes the same checks as `CREATE TABLE` and does not just copy the `.frm` file. This means that if the current SQL mode is different from the mode in effect when the original table was created, the table definition might be considered invalid for the new mode and the statement will fail. (Bug #42546, Bug #11751609)

- **Incompatible Change**: Due to work done for Bug #989, `FLUSH TABLES` is not permitted when there is an active `LOCK TABLES ... READ`. This caused a problem with `mysqlhotcopy`, which used that sequence of statements. `mysqlhotcopy` now uses `FLUSH TABLES` *`tbl_list`* `WITH READ LOCK` to flush and lock tables. If `mysqlhotcopy` is used with a server older than MySQL 5.5.3 that does not support this statement, it has a new option `--old_server` that causes it to use the previous statement sequence.

  To provide a workaround for the restriction that `FLUSH TABLES` is no longer permitted when there is an active `LOCK TABLES ... READ`, `FLUSH TABLES` has a new variant, `FLUSH TABLES` *`tbl_list`* `WITH READ LOCK`, that enables tables to be flushed and locked in a single operation. As a result of this change, applications that previously used this statement sequence to lock and flush tables will fail:

  ```
  LOCK TABLES tbl_list READ;
  FLUSH TABLES tbl_list;
  ```

Such applications should now use this statement instead:

```
FLUSH TABLES tbl_list WITH READ LOCK;
```

(Bug #42465)

- **Incompatible Change**: The parser accepted illegal syntax in a `FOREIGN KEY` clause:
  - Multiple `MATCH` clauses.
  - Multiple `ON DELETE` clauses.
  - Multiple `ON UPDATE` clauses.
  - `MATCH` clauses specified after `ON UPDATE` or `ON DELETE`. In case of multiple redundant clauses, this leads to confusion, and implementation-dependent results.

  These illegal syntaxes are now properly rejected. Existing applications that used them will require adjustment. (Bug #34455)
- **Incompatible Change**: The parser accepted an `INTO` clause in nested `SELECT` statements, which is invalid because such statements must return their results to the outer context. This syntax is no longer permitted. (Bug #33204)
- **Incompatible Change**: The `Locked` thread state was equivalent to the `Table lock` state and has been removed. It no longer appears in `SHOW PROCESSLIST` output. (Bug #28870)
- **Incompatible Change**: Several changes were made to alias resolution in multiple-table `DELETE` statements so that it is no longer possible to have inconsistent or ambiguous table aliases.
  - In MySQL 5.1.23, alias declarations outside the *`table_references`* part of the statement were disallowed for the `USING` variant of multiple-table `DELETE` syntax, to reduce the possibility of ambiguous aliases that could lead to ambiguous statements that have unexpected results such as deleting rows from the wrong table.

    Now alias declarations outside *`table_references`* are disallowed for all multiple-table `DELETE` statements. Alias declarations are permitted only in the *`table_references`* part.

    Incorrect:

    ```
    DELETE FROM t1 AS a2 USING t1 AS a1 INNER JOIN t2 AS a2;
    DELETE t1 AS a2 FROM t1 AS a1 INNER JOIN t2 AS a2;
    ```

    Correct:

    ```
    DELETE FROM t1 USING t1 AS a1 INNER JOIN t2 AS a2;
    DELETE t1 FROM t1 AS a1 INNER JOIN t2 AS a2;
    ```

  - Previously, for alias references in the list of tables from which to delete rows in a multiple-table delete, the default database is used unless one is specified explicitly. For example, if the default database is `db1`, the following statement does not work because the unqualified alias reference `a2` is interpreted as having a database of `db1`:

    ```
    DELETE a1, a2 FROM db1.t1 AS a1 INNER JOIN db2.t2 AS a2
    WHERE a1.id=a2.id;
    ```

    To correctly match an alias that refers to a table outside the default database, you must explicitly qualify the reference with the name of the proper database:

    ```
    DELETE a1, db2.a2 FROM db1.t1 AS a1 INNER JOIN db2.t2 AS a2
    WHERE a1.id=a2.id;
    ```

    Now alias resolution does not require qualification and alias references should not be qualified with the database name. Qualified names are interpreted as referring to tables, not aliases.

  Statements containing alias constructs that are no longer permitted must be rewritten. (Bug #27525)

  References: See also Bug #30234.
- **Incompatible Change**: `DROP TABLE` now is permitted only if you have acquired a `WRITE` lock with `LOCK TABLES`, or if you hold no locks, or if the table is a `TEMPORARY` table.

  Previously, if other tables were locked, you could drop a table with a read lock or no lock, which could lead to deadlocks

between clients. The new stricter behavior means that some usage scenarios will fail when previously they did not. (Bug #25858)

- **Incompatible Change**: If a data definition language (DDL) statement occurred for a table that was being used by another session in an active transaction, statements could be written to the binary log in the wrong order. For example, this could happen if `DROP TABLE` occurred for a table being used in a transaction. This is now prevented by deferring release of metadata locks on tables used within a transaction until the transaction ends.

  This bug fix results in some incompatibilities with previous versions:

  - A table that is being used by a transaction within one session cannot be used in DDL statements by other sessions until the transaction ends.
  - `FLUSH TABLES` is not permitted when there is an active `LOCK TABLES ... READ`. Use `FLUSH TABLES tbl_list WITH READ LOCK` instead. This causes a problem with `mysqlhotcopy`, fixed in Bug #42465.

  (Bug #989, Bug #39675)

- **Important Change**: **Replication**: For an engine that supported only row-based replication, replication stopped with an error when executing row events.

  For information about changes in how the binary logging format is determined in relation to statement type and storage engine logging capabilities, see Section 5.2.4.3, “Mixed Binary Logging Format”.

  As part of the fix for this issue, the `EXAMPLE` storage engine is now changed so that it supports statement-based logging only. Previously, it supported row-based logging only. (Bug #39934, Bug #11749859)

- **Important Change**: The IPv6 loopback address `::1` was interpreted as a hostname rather than a numeric IP address.

  In addition, the IPv6-enabled server on Windows interpreted the hostname `localhost` as `::1` only, which failed to match the default `'root'@'127.0.0.1'` account in the `mysql.user` privilege table.

  > **Note**
  >
  > As a result of this fix, a `'root'@'::1'` account is added to the `mysql.user` table as one of the default accounts created during MySQL installation.

  (Bug #43006)

  References: See also Bug #38247, Bug #45283, Bug #45584, Bug #45606.

- **InnoDB Storage Engine**: **Replication**: Column length information generated by `InnoDB` did not match that generated by `MyISAM`, which caused invalid metadata to be written to the binary log when trying to replicate `BIT` columns. (Bug #49618)

- **InnoDB Storage Engine**: `SHOW INNODB STATUS` could display incorrect information about deadlocks, when the deadlock detection routine stops early (to avoid excessive CPU usage). (Bug #49001)

- **InnoDB Storage Engine**: Concurrent execution of `ALTER TABLE` for `InnoDB` table and a transaction that tried to read and then update the table could result in a deadlock between table-level locks and `InnoDB` row locks, which was detected only after the `innodb_lock_wait_timeout` timeout occurred. (Bug #37346)

- **Partitioning**: When using a debug build of MySQL, if a query against a partitioned table having an index on one or more `DOUBLE` columns used that index, the server failed with an assertion. (Bug #45816)

- **Partitioning**: The first time that a query against the `INFORMATION_SCHEMA.TABLES` table for partitioned tables using the `ARCHIVE` engine was run, it returned invalid data. If the server had been restarted since such a table had been created, or if the table had never actually been opened, its `DATA_LENGTH` was reported as 0 bytes. (The second and subsequent attempts to issue the same query returned the expected result.) (Bug #44622)

- **Partitioning**: `ALTER TABLE` on a partitioned table caused unnecessary deadlocks. (Bug #43867)

  References: See also Bug #46654. This bug is a regression of Bug #40181.

- **Partitioning**: After attempting to create a duplicate index on a partitioned table (and having the attempt fail as expected), a subsequent attempt to create a new index on the table caused the server to hang. (Bug #40181)

- **Partitioning**: Attempting to drop a partitioned table from one connection while waiting for the completion of an `ALTER TABLE` that had been issued from a different connection, and that changed the storage engine used by the table, could cause the server to crash. (Bug #42438)

- **Partitioning**: When used on a partitioned table, `ALTER TABLE` produced the wrong error message when the name of a nonexistent storage engine was used in the `ENGINE` clause. (Bug #35765)

- **Partitioning**: Portions of the partitioning code were refactored in response to potential regression issues uncovered while working on the fix for Bug #31210. (Bug #32115)

  References: See also Bug #40281.

- **Partitioning**: When one user was in the midst of a transaction on a partitioned table, a second user performing an `ALTER TABLE` on this table caused the server to hang. (Bug #34604)

- **Replication**: Statements that updated `AUTO_INCREMENT` columns in multiple tables were logged using the row-based format when `--binlog_format` was set to `MIXED`, but did not cause an `UNSAFE STATEMENT` warning to be generated when `--binlog_format` was set to `STATEMENT`. (Bug #45827)

  References: See also Bug #39934, Bug #11749859.

- **Replication**: When using statement-based replication, database-level character sets were not always honored by the replication SQL thread. This could cause data inserted on the master using `LOAD DATA` to be replicated using the wrong character set.

  > **Note**
  >
  > This was not an issue when using row-based replication.

  (Bug #45516)

- **Replication**: When using row-based replication, the incomplete logging of a group of events involving both transaction and nontransactional tables could cause `STOP SLAVE` to hang. (Bug #45940)

  References: See also Bug #319, Bug #38205.

- **Replication**: When using the row-based or mixed replication format with a debug build of the MySQL server, inserts into columns using the `utf32` character set on the master caused the slave to crash. (Bug #51787)

  References: See also Bug #51716.

- **Replication**: When using the row-based or mixed replication format, column values using the `utf16` character set on the master were padded incorrectly on the slave. (Bug #51716)

  References: See also Bug #51787.

- **Replication**: When using the semisynchronous replication plugin on Windows, the wait time calculated when the master was waiting for reply from the slave was incorrect. In addition, when the wait time was less than the current time, the master did not wait for a reply at all.

  This issue was caused by the fact that a different internal function was used to get current time by the plugin on Windows as opposed to other platforms, and this function was not correctly implemented. Now the Windows version of the plugin uses the same function as other platforms for this purpose. (Bug #49557)

- **Replication**: If a `CHANGE MASTER TO` statement set `MASTER_HEARTBEAT_PERIOD` to 30 or higher, `Slave_received_heartbeats` did not increase on the slave. This caused the slave to reconnect before the time indicated by `slave_net_timeout` had elapsed.

  This issue affected big-endian 64-bit platforms such as Solaris/SPARC. (Bug #50296)

- **Replication**: Adding an index to a table on the master caused the slave to stop logging slow queries to the slow query log. (Bug #50620)

- **Replication**: An issue internal to the code, first seen in Bug #49132 but not completely resolved in the fix for that bug, was removed. This should prevent similar issues to those in the previous bug with `binlog_format` changes following DDL statements.

  For developers working with the MySQL Server code: the public class variable `THD::current_stmt_binlog_row_based` was supposed to have been removed as part of the fix for Bug #39934, but was still present in the code. If a developer later tried to use this variable, it could cause the previous issues to re-occur, and possibly new ones to arise. The variable has now been removed; the previously added class functions `THD::is_current_stmt_binlog_format_row()`, `THD::set_current_stmt_binlog_format_row()`, and `THD::clear_current_stmt_binlog_format_row()` should be used instead. (Bug #51021)

  References: See also Bug #11749859.

- **Replication**: The error message given when trying to replicate (using statement-based mode) insertions into an `AUTO_INCREMENT` column by a stored function or a trigger was improved. (Bug #50192)

- **Replication**: Statement-based replication of user variables having numeric data types did not always work correctly. (Bug #49562, Bug #11757508)

- **Replication**: There were two related issues concerning handling of unsafe statements and setting of the binary logging format when there were open temporary tables on the master, and the existing replication format was row-based or mixed:

  1. When using `binlog_format=ROW`, and an unsafe statement was executed while there were open temporary tables on the master, the statement `SET @@session.binlog_format = MIXED` failed with the error `CANNOT SWITCH OUT OF THE ROW-BASED BINARY LOG FORMAT WHEN THE SESSION HAS OPEN TEMPORARY TABLES`.

  2. When using `binlog_format=MIXED`, and an unsafe statement was executed while there were open temporary tables on the master, the statement `SET @@session.binlog_format = STATEMENT` caused any subsequent DML statements to be written to the binary log using the row-based format instead of the statement-based format.

  (Bug #45855, Bug #45856)

- **Replication**: The server could deadlock when `FLUSH LOGS` was executed concurrently with DML statements. To fix this problem, nontransactional changes are now always flushed before transactional changes. (Bug #50038)

- **Replication**: Metadata for `GEOMETRY` fields was not properly stored by the slave in its definitions of tables. (Bug #49836)

  References: See also Bug #48776.

- **Replication**: Due to a change in the format of the information used by the slave to connect to the master, which could cause to reject connection attempts to older masters by newer slaves. (Bug #49259)

  References: This bug was introduced by Bug #13963.

- **Replication**: When using row-based logging, a failing `INSERT ... SELECT` statement on a nontransactional table was not flagged correctly, such that, if a rollback was requested and no other nontransactional table had been updated, nothing was written to the binary log. (Bug #47175)

  References: See also Bug #40278.

- **Replication**: Even though `INSERT DELAYED` statements are unsafe for statement-based replication, they caused the statement only to be logged in row format when the binary logging format was `MIXED`, but did not cause a warning to be generated when the binary logging format was `STATEMENT`. (Bug #45825)

- **Replication**: When using `MIXED` binary logging format, statements containing a `LIMIT` clause and occurring in stored routines were not written to the log as row events. (Bug #45785)

- **Replication**: Large transactions and statements could corrupt the binary log if the size of the cache (as set by `max_binlog_cache_size`) was not large enough to store the changes.

  Now, for transactions that do not fit into the cache, the statement is not logged, and the statement generates an error instead.

  For nontransactional changes that do not fit into the cache, the statement is also not logged—an incident event is logged after committing or rolling back any pending transaction, and the statement then raises an error.

  > **Note**
  >
  > If a failure occurs before the incident event is written the binary log, the slave does not stop, and the master does not report any errors.

  (Bug #43929, Bug #11752675)

  References: See also Bug #37148, Bug #11748696, Bug #46166, Bug #11754544.

- **Replication**: Executing the sequence of statements `RESET SLAVE`, `RESET MASTER`, and `FLUSH LOGS`, when binary log or relay log files listed in the index file could not be found, could cause the server to crash. This could happen, for example, when these files had been moved or deleted manually. (Bug #41902)

- **Replication**: MySQL creates binary logs in a numbered sequence, with a maximum possible 4294967295 concurrent log files, 4294967295 being the maximum value for an unsigned long integer. However, binary log file extensions were turned into negative numbers once the variable used to hold the value reached the maximum value for a signed long integer (2147483647). Consequently, when the sequence value was incremented to the next (negative) number, MySQL tried to create the file using a `.000000` extension, causing the server to fail since this file already existed.

Negative file extensions are no longer permitted, and an error is returned when the limit is reached. In addition, `FLUSH LOGS` now also reports warnings to the user, if the extension number has reached the limit, and warnings are printed to the error log when the limit is approaching. (Bug #40611)

- **Replication**: Issuing concurrent `STOP SLAVE`, `START SLAVE`, and `RESET SLAVE` statements using different connections caused the replication slave to crash. (Bug #38716)

  References: See also Bug #38715, Bug #44312.

- **Replication**: On Windows, `RESET MASTER` failed in the event of a missing binlog file rather than issuing a warning and completing the rest of the statement. (Bug #42150, Bug #42218)

- **Replication**: A slave compiled using `--with-libevent` and run with `--thread-handling=pool-of-threads` could sometimes crash. (Bug #36929)

- **Replication**: `STOP SLAVE` did not flush the relay log or the `master.info` or `relay-log.info` files, which could lead to corruption if the server crashed. (Bug #44188)

- **Replication**: `mysqlbinlog` sometimes failed when trying to create temporary files; this was because it ignored the specified temp file directory and tried to use the system `/tmp` directory instead. (Bug #35546)

  References: See also Bug #35543.

- **Replication**: A `CHANGE MASTER TO` statement with no `MASTER_HEARTBEAT_PERIOD` option failed to reset the heartbeat period to its default value. (Bug #34686)

- **Replication**: Formerly, only slaves that had been started with the `--report-hosts` option were visible in the output of `SHOW SLAVE HOSTS`. Now, all slaves that are registered with the master appear in `SHOW SLAVE HOSTS` output.

  As part of the fix for this issue, the `Rpl_recovery_rank` column, which had appeared in the output of `SHOW SLAVE HOSTS` in some MySQL releases, was removed because the corresponding server variable `rpl_recovery_rank` (now deprecated) was never actually used. (Bug #13963)

  References: See also Bug #21132, Bug #21869.

- For an IPv6-enabled MySQL server, privileges specified using standard IPv4 addresses for hosts were not matched (only IPv4-mapped addresses were handled correctly).

  As part of the fix for this bug, a new build option `--disable-ipv6` has been introduced. Compiling MySQL with this option causes all IPv6-specific code in the server to be ignored.

  > **Important**
  >
  > If the server has been compiled using `--disable-ipv6`, it is not able to resolve hostnames correctly when run in an IPv6 environment.

  (Bug #45606)

  References: See also Bug #38247, Bug #43006, Bug #45283, Bug #45584.

- The hostname cache failed to work correctly. (Bug #45584)

  References: See also Bug #38247, Bug #43006, Bug #45283, Bug #45606.

- A Windows Installation using the GUI installer would fail with:

  ```
  MySQL Server 5.1 Setup Wizard ended prematurely

  The wizard was interrupted before MySQL Server 5.1. could be completely installed.

  Your system has not been modified. To complete installation at another time, please run
  setup again.

  Click Finish to exit the wizard
  ```

  This was due to a step in the MSI installer that could fail to execute correctly on some environments. (Bug #45418)

- Execution of `FLUSH TABLES` or `FLUSH TABLES WITH READ LOCK` concurrently with `LOCK TABLES` resulted in deadlock. (Bug #45066)

- Killing a delayed-insert thread could cause a server crash. (Bug #45067)

- The server could crash attempting to flush privileges after receipt of a `SIGHUP` signal. (Bug #46495)
- Improperly closing tables when `INSERT DELAYED` needed to reopen tables could cause an assertion failure. (Bug #45949)

  References: See also Bug #18484.
- Deadlock occurred if one session was running a multiple-statement transaction that involved a single partitioned table and another session attempted to alter the table. (Bug #46654)
- If `INSERT INTO tbl_name` invoked a stored function that modified `tbl_name`, the server crashed. (Bug #46374)
- `CREATE VIEW` raised an assertion if a temporary table existed with the same name as the view. (Bug #47635)
- Selecting from the process list in the embedded server caused a crash. (Bug #47304)

  References: See also Bug #43733.
- If a temporary table was created with the same name as a view referenced in a stored routine, routine execution could raise an assertion. (Bug #47313)
- Programs did not exit if the option file specified by `--defaults-file` was not found. (Bug #47216)
- For queries that used `GROUP_CONCAT(DISTINCT ...)`, the value of `max_heap_table_size` was used for memory allocation, which could be excessive. Now the minimum of `max_heap_table_size` and `tmp_table_size` is used. (Bug #46018)
- Valgrind warnings for several logging messages were corrected. (Bug #49130)
- The `mysql` could default to the `ascii` character set, which is not a valid character set choice for MySQL. The `latin1` character set will now be used when an ASCII environment has been identified. (Bug #51166)
- Running `SHOW CREATE TABLE` on a view `v1` that contained a function which accessed another view `v2` could trigger a infinite loop if the view referenced within the function (`v2`) caused a warning to be raised while being opened. (Bug #48449)
- If a prepared statement used both a `MERGE` table and a stored function or trigger, execution sometimes failed with a `No SUCH TABLE` error. (Bug #47648)
- An `.ARZ` file missing from the database directory caused the server to crash. (Bug #48757)
- On some Unix/Linux platforms, an error during build from source could be produced, referring to a missing `LT_INIT` program. This is due to versions of `libtool` 2.1 and earlier. (Bug #51009)
- Corrected a potential problem of unintended file overwriting when the `MY_DONT_OVERWRITE_FILE` flag was used. (Bug #47126)
- If a stored function contained a `RETURN` statement with an `ENUM` value in the `ucs2` character set, `SHOW CREATE FUNCTION` and `SELECT DTD_IDENTIFIER FROM INFORMATION_SCHEMA.ROUTINES` returned incorrect values. (Bug #48766)
- An aliasing violation in the C API could lead to a crash. (Bug #48284)
- A dependent subquery containing `COUNT(DISTINCT col_name))` could be evaluated incorrectly. (Bug #48920)
- `mysqltest` no longer permits you to execute an SQL statement on a connection after doing a `send` command, unless you do a `reap` first. This was previously accepted but could produce unpredictable results. (Bug #49269)
- The return values for calls to put information into the stored routine cache were not consistently checked, raising an assertion. (Bug #50412)
- `HANDLER` statements within a transaction that already holds metadata locks could lead to deadlocks.

  Before this fix, all handlers for `TEMPORARY` tables were reset whenever any base table was opened. (Bug #46224)
- There was no timeout for attempts to acquire metadata locks (for example, a `DROP TABLE` attempt for a table that was open in another transaction would not time out).

  To handle such situations, there is now a `lock_wait_timeout` system variable that specifies the timeout in seconds for attempts to acquire metadata locks. The permitted values range from 1 to 31536000 (1 year). The default is 31536000.

  This timeout applies to all statements that use metadata locks. These include DML and DDL operations on tables, views, stored procedures, and stored functions, as well as `LOCK TABLES`, `FLUSH TABLES WITH READ LOCK`, and `HANDLER` state-

ments.

The timeout value applies separately for each metadata lock attempt. A given statement can require more than one lock, so it is possible for the statement to block for longer than the `lock_wait_timeout` value before reporting a timeout error. When lock timeout occurs, `ER_LOCK_WAIT_TIMEOUT` is reported.

`lock_wait_timeout` does not apply to delayed inserts, which always execute with a timeout of 1 year. This is done to avoid unnecessary timeouts because a session that issues a delayed insert receives no notification of delayed insert timeouts.

In addition: The unused `table_lock_wait_timeout` system variable was removed. The `LOW_PRIORITY` modifier for `LOCK TABLES ... WRITE` locks now has no effect. The meaning of `LOW_PRIORITY` remains as before in other contexts, such as for `INSERT` or `DELETE` statements. `innodb_table_locks=0` no longer has an effect for tables locked explicitly with `LOCK TABLES ... WRITE`. It still has an effect for tables locked for read or write by `LOCK TABLES ... WRITE` implicitly (for example, through triggers) or by `LOCK TABLES ... READ`. (Bug #45225, Bug #56272)

- `mysqld_multi` failed due to a syntax error in the script. (Bug #51468)
- On POSIX systems, calls to `select()` with a file descriptor set larger than `FD_SETSIZE` resulted in unpredictable I/O errors; for example, when a large number of tables required repair. (Bug #48929)
- For debug builds, `SHOW BINARY LOGS` raised an assertion if binary logging was not enabled. (Bug #50780)
- Full-text queries that used the truncation operator (`*`) could enter an infinite loop. (Bug #50351)
- For debug builds on Windows, warnings about incorrect use of debugging directives were written to the error log. The directives were rewritten to eliminate these messages. (Bug #49025)
- Slow `CALL` statements were not always logged to the slow query log because execution time for multiple-statement stored procedures was assessed incorrectly. (Bug #47905)
- The optimizer normally prefers use of `filesort` plus the join cache to a full index scan. But this combination was used even if the index is clustered, in which case, the clustered index scan can be faster. (Bug #50843)
- Incorrect handling of `BIT` columns in temporary tables could lead to spurious duplicate-key errors. (Bug #50591)
- Referring to a subquery result in a `HAVING` clause could produce incorrect results. (Bug #50995)
- `mysql --show-warnings` crashed if the server connection was lost. (Bug #49646)
- `ALTER TABLE` on a `MERGE` table that has been locked using `LOCK TABLES ... WRITE` incorrectly produced an `ER_TABLE_NOT_LOCKED_FOR_WRITE` error. (Bug #51240)
- Attempts to print octal numbers with `my_vsnprintf()` could cause a crash. (Bug #47212)
- Setting `binlog_format` to `DEFAULT` assigned a value different from the default. (Bug #49540)
- `SHOW VARIABLES` did not correctly display string-valued system variables that contained `\0` characters. (Bug #49644)
- MySQL program option-processing code incorrectly displayed some options when printing ambiguous-option errors. (Bug #49640)
- For string-valued system variables containing multibyte characters, the byte length was used in contexts where the character length was more appropriate. (Bug #49645)
- Failure to open a view with a nonexistent `DEFINER` was improperly handled and the server crashed later attempting to lock the view. (Bug #47734)
- Valgrind warnings about uninitialized variables in optimizer code were corrected. (Bug #45195)
- Propagation of a large unsigned numeric constant in `WHERE` expressions could lead to incorrect results. This also affected `EXPLAIN EXTENDED`, which printed incorrect numeric constants in such transformed `WHERE` expressions. (Bug #45360)
- Grouping by a subquery in a query with a `DISTINCT` aggregate function led to incorrect and unordered grouping values. (Bug #45640)
- Valgrind warnings about memory allocation overruns for handling `CREATE FUNCTION` statements for UDFs were corrected. (Bug #46570)
- The server did not recognize that the stored procedure cache became invalid if a view was created or modified within a procedure, resulting in a crash. (Bug #50624)

- The second or subsequent invocation of a stored procedure containing `DROP TRIGGER` could cause a server crash. (Bug #50423)
- For debug builds, an assertion was incorrectly raised in the optimizer when matching `ORDER BY` expressions. (Bug #50335)
- Queries optimized with `GROUP_MIN_MAX` did not clean up `KEYREAD` optimizations properly, causing subsequent queries to return incomplete rows. (Bug #49902)
- For dynamic format `MyISAM` tables containing `LONGTEXT` columns, a bulk `INSERT ... ON DUPLICATE KEY UPDATE` or bulk `REPLACE` could cause corruption. (Bug #49628)
- For debug builds, with `sql_safe_updates` enabled, a multiple-table `UPDATE` with the `IGNORE` modifier could raise an assertion. (Bug #49534)
- For debug builds, killing a `SELECT` retrieving from a view that was processing a function raised an assertion. (Bug #47736)
- For debug builds, creating a view containing a row constructor raised an assertion. (Bug #48294)
- Invalid memory reads could occur following a query that referenced a `MyISAM` table multiple times with a write lock. (Bug #48438)
- `EXPLAIN EXTENDED` crashed trying to print column names for a subquery in the `FROM` clause when the table had gone out of scope. (Bug #49487)
- Renaming a column of an `InnoDB` table caused the server to go out of sync with the `InnoDB` data dictionary. To avoid this issue, renaming a column uses the older technique of copying all the table data rather than updating the table in-place. (Bug #47621)
- For `InnoDB` tables, the test for using an index for `ORDER BY` sorting did not distinguish between primary keys and secondary indexes and expected primary key values to be concatenated to index values the way they are to secondary key values. (Bug #49324)
- `mysqld_safe` did not pass the correct default value of `plugin_dir` to `mysqld`. (Bug #51938)
- Plugins in a binary release could not be installed into a debug version of the server. (Bug #49022)
- Aggregate functions on `TIMESTAMP` columns could yield incorrect or undefined results. (Bug #50888)
- An IPv6-enabled MySQL server did not resolve the IP addresses of incoming connections correctly, with the result that a connection that attempted to match any privilege table entries using fully-qualified domain names for hostnames or hostnames using wildcards were dropped. (Bug #38247)

  References: See also Bug #43006, Bug #45283, Bug #45584, Bug #45606.
- MySQL Server permitted the creation of a merge table based on views but crashed when attempts were made to read from that table. The following example demonstrates this:

  ```
  #Create a test table
  CREATE TABLE tmp (id int, c char(2));

  #Create two VIEWs upon it
  CREATE VIEW v1 AS SELECT * FROM tmp;
  CREATE VIEW v2 AS SELECT * FROM tmp;

  #Finally create a MERGE table upon the VIEWs
  CREATE TABLE merge (id int, c char(2))
  ENGINE=MERGE UNION(v1, v2);

  #Reading from the merge table lead to a crash
  SELECT * FROM merge;
  ```

  The final statement generated the crash. (Bug #44040)
- When archive tables were joined on their primary keys, a query returned no result if the optimizer chose to use this index. (Bug #40677)
- The `CSV` storage engine did not parse `'\X'` characters when they occurred in unquoted fields. (Bug #40814)
- Dropping a locked `Maria` table leads to an assertion failure. (Bug #39395)
- Host name lookup failure could lead to a server crash. (Bug #39153)
- Threads were set to the `Table lock` state in such a way that use of this state by other threads to check for a lock wait was subject to a race condition. (Bug #39897)

- Sign loss could occur in several contexts:

  - `SEC_TO_TIME()` could lose the sign of negative arguments.
  - `MAKETIME()` could lose the sign of negative arguments.
  - Comparison of `TIME` values could lose the sign of operands.

  (Bug #42661, Bug #42662, Bug #42664)

- The state of a thread for the embedded server was always displayed as `Writing to net`, which is incorrect because there is no network connection for the embedded server. (Bug #41971)

- `mysqld_safe` did not treat dashes and underscores as equivalent in option names. Thanks to Erik Ljungstrom for the patch to fix this bug. (Bug #40368)

- Valgrind warnings that occurred for `SHOW TABLE STATUS` with `InnoDB` tables were silenced. (Bug #38479)

- A natural join of `INFORMATION_SCHEMA` tables could cause an assertion failure. (Bug #43834)

- Plugin shutdown could lead to an assertion failure caused by using an already destroyed mutex in the metadata locking subsystem. (Bug #39674)

- The patch for Bug #10374 broke named-pipe and shared-memory connections on Windows. (Bug #41860)

- The `mysql_real_connect()` C API function only attempted to connect to the first IP address returned for a hostname. This could be a problem if a hostname mapped to multiple IP address and the server was not bound to the first one returned. Now `mysql_real_connect()` attempts to connect to all IPv4 or IPv6 addresses that a domain name maps to. (Bug #45017)

  References: See also Bug #47757.

- The server could crash if an attempt to open a `MERGE` table child `MyISAM` table failed. (Bug #42862)

- `HANDLER` statements are now not permitted if a table lock has been acquired with `LOCK TABLES`. (Bug #43272)

- An assertion failure could occur if `OPTIMIZE TABLE` was started on an `InnoDB` table and the table was altered to a different storage engine during the optimization operation. (Bug #42074)

- `SHOW CREATE VIEW` returned invalid SQL if the definition contained a `SELECT 'string'` statement where the *`string`* was longer than the maximum length of a column name, due to the fact that this text was also used as an alias (in the `AS` clause).

  Because not all names retrieved from arbitrary `SELECT` statements can be used as view column names due to length and format restrictions, the server now checks the conformity of automatically generated column names and rewrites according to a predefined format any names that are not acceptable as view column names before storing the final view definition on disk.

  In such cases, the name is now rewritten as `Name_exp_`*`pos`*, where *`pos`* is the position of the column. To avoid this conversion scheme, define explicit, valid names for view columns using the *`column_list`* clause of the `CREATE VIEW` statement.

  As part of this fix, aliases are now generated only for top-level statements. (Bug #40277)

- `InnoDB` took a shared row lock when executing `SELECT` statements inside a stored function as a part of a transaction using `REPEATABLE READ`. This prevented other transactions from updating the row. (Bug #44613)

- Purging the stored-routine cache could take a long time and render the server unresponsive. (Bug #41804)

- When used in conjunction with `LOCK TABLES`, `FLUSH TABLE` *`tbl_list`* waited for all tables with old versions to clear from the table definition list, rather than only the named tables. (Bug #43685)

- Setting `key_buffer_size` to a negative value could lead to very large allocations. Now an error occurs. (Bug #42103)

- In the embedded server, stack overflow checks for recursive stored procedure calls did not work and stack overflow could occur. (Bug #43201)

- Some plugins configured as mandatory could be disabled at server startup. (Bug #44691)

- `flush_cache_records()` did not correctly check for errors that should cause statement execution to stop, leading to a server crash. (Bug #39022)

- `InnoDB` logged an error repeatedly trying to load a page into the buffer pool, filling the error log and using excessive disk

space. Now the number of attempts is limited to 100, after which the operation aborts with a message. (Bug #38901)

- Command-line options for enumeration-type plugin variables were not honored. (Bug #41010)
- For plugins that did not have command-line options other than the ones to select the plugin itself, those options were not displayed in the `mysqld` help message. (Bug #44797)
- System variables could be set to invalid values. (Bug #40988)
- For `CREATE TABLE ... LIKE` with a `MERGE` source table that included a `UNION` clause, that clause was omitted from the definition of the destination table. (Bug #37371)
- `mysqlbinlog` left temporary files on the disk after shutdown, leading to the pollution of the temporary directory, which eventually caused `mysqlbinlog` to fail. This caused problems in testing and other situations where `mysqlbinlog` might be invoked many times in a relatively short period of time. (Bug #35543)
- Compiling MySQL on FreeBSD failed due to missing definitions for certain network constants. (Bug #34292)
- The parser incorrectly permitted MySQL error code 0 to be specified for a condition handler. (This is incorrect because the condition must be a failure condition and 0 indicates success.) (Bug #36510)
- `mysql_stmt_prepare()` did not reset the list of messages (those messages available using `SHOW WARNINGS`). (Bug #36004)
- Killing a statement that invoked a stored function could return an incorrect error message indicating table corruption rather than that the statement had been interrupted. (Bug #32140)
- Occurrence of an error within a stored routine did not always cause immediate statement termination. (Bug #31881)
- For `DROP FUNCTION db_name.func_name` (that is, when the function name is qualified with the database name), the statement should apply only to a stored function named `func_name` in the given database. However, if a UDF with the same name existed, the statement dropped the UDF instead. (Bug #31767)
- Previously, statements inside a stored program did not clear the warning list. For example, warnings or errors generated by statements within a trigger or stored function would be accumulated and added to the message list for the statement that activated the trigger or invoked the function, “polluting” the output of `SHOW WARNINGS` or `SHOW ERRORS` for the outer statement. Normally, messages for a statement that can generate messages replace messages from the previous such statement. The effect was that a statement could have a different effect on the message list depending on whether it executed inside or outside of a stored program.

  Now within a stored program, successive statements that can generate messages update the message list and replace messages from the previous such statement. Only messages from the last of these statements is copied to the message list for the outer statement. (Bug #36649)
- When parsing or formatting interval values of `DAY_MICROSECOND` type, fractional seconds were not handled correctly when more-significant fields were implied or omitted. (Bug #36466)
- `myisampack --join` did not create the destination table `.frm` file. (Bug #36573)
- `mysql_install_db` failed if run as `root` and the root directory (`/`) was not writable. (Bug #36462)
- Creation of a temporary `BLOB` or `TEXT` column could create a column with the wrong maximum length. (Bug #33969)
- Constant expressions in `WHERE`, `HAVING`, or `ON` clauses were not cached, but were evaluated for each row. This caused a slowdown of query execution, especially if constant user-defined functions or stored functions were used. (Bug #33546)
- When building MySQL when using a different target directory (for example using the `VPATH` environment variable), the build of the embedded `readline` component failed. (Bug #35250)
- When `read_only` was enabled, the server incorrectly prevented data modifications to `TEMPORARY` tables belonging to transactional storage engines such as `InnoDB`. (Bug #33669)
- `INSERT INTO ... VALUES(DEFAULT)` failed to insert the correct value for `ENUM` columns. For `MyISAM` tables, an empty value was inserted. For `CSV` tables, the table became corrupt. (Bug #33717)
- The `sql_mode` system variable could be assigned the illegal value of `'?'`. (Bug #34834)
- String-valued system variables could be assigned literal values, but could not be assigned values using expressions. Now expressions are legal. (Bug #34883, Bug #46314)
- Plugins could find the unqualified form of their system variables but not the qualified form. For example, a plugin `p` with a sys-

tem variable `sv` could find `sv` but not `p_sv`. (Bug #32902)

- A global read lock obtained with `FLUSH TABLES WITH READ LOCK` did not prevent sessions from creating tables. (Bug #35935)

- If an operation had an `InnoDB` table, and two triggers, `AFTER UPDATE` and `AFTER INSERT`, competing for different resources (such as two distinct `MyISAM` tables), the triggers were unable to execute concurrently. In addition, `INSERT` and `UPDATE` statements for the `InnoDB` table were unable to run concurrently. (Bug #26141)

- `mysqld` sometimes miscalculated the number of digits required when storing a floating-point number in a `CHAR` column. This caused the value to be truncated, or (when using a debug build) caused the server to crash. (Bug #26788)

  References: See also Bug #12860.

- When inserting an extraordinarly large value into a `DOUBLE` column, the value could be truncated in such a way that the new value cannot be reloaded manually or from the output of `mysqldump`. (Bug #21497)

- `Data truncated for column` *`col_num`* `at row` *`row_num`* warnings were generated for some (constant) values that did not have too high precision. (Bug #24541)

- Statements to create, alter, or drop a view were not waiting for completion of statements that were using the view, which led to incorrect sequences of statements in the binary log when statement-based logging was enabled. (Bug #25144)

- `ALTER TABLE` could not be used to add columns to a table if the table had an index on a `utf8` column with a `TEXT` data type. (Bug #26180)

- Several data-modification statements were not being counted toward the `MAX_UPDATES_PER_HOUR` user resource limit. (Bug #21793)

- Previously, the server handled character data types for a stored routine parameter, local routine variable created with `DECLARE`, or stored function return value as follows: If the `CHARACTER SET` attribute was present, the `COLLATE` attribute was not supported, so the character set's default collation was used. (This includes use of `BINARY`, which in this context specifies the binary collation of the character set.) If there was no `CHARACTER SET` attribute, the database character set and its default collation were used.

  Now for character data types, if there is a `CHARACTER SET` attribute in the declaration, the specified character set and its default collation is used. If the `COLLATE` is also present, that collation is used rather than the default collation. If there is no `CHARACTER SET` attribute, the database character set and collation in effect at routine creation time are used. (The database character set and collation are given by the value of the `character_set_database` and `collation_database` system variables.) (Bug #24690)

- A statement that caused a circular wait among statements did not return a deadlock error. Now the server detects deadlock and returns `ER_LOCK_DEADLOCK`. (Bug #22876)

- `CREATE TABLE ... LIKE` did not always produce an error is the source table column defaults were illegal for the current version of MySQL. (This could occur if the table was created using an older server that was less restrictive about legal default values.) (Bug #22090)

- The character set was not being properly initialized for `CAST()` with a type such as `CHAR(2) BINARY`, which resulted in incorrect results or a server crash. (Bug #17903)

- Zero-padding of exponent values was not the same across platforms. (Bug #12860)

- Stored procedure exception handlers were catching fatal errors (such as out of memory errors), which could cause execution not to stop to due a continue handler. Now fatal errors are not caught by exception handlers and a fatal error is returned to the client. (Bug #15192)

- Delayed-insert threads were counted as connected but not as created, incorrectly leading to a `Threads_connected` value greater than the `Threads_created` value. (Bug #17954)

- For `INSERT DELAYED` statements issued for a table while an `ALTER TABLE` operation on the table was in progress, the server could return a spurious `Server shutdown in progress` error. (Bug #18484)

  References: See also Bug #45949.

- The value of `sql_slave_skip_counter` was empty when displayed by `SHOW VARIABLES` or `INFORMATION_SCHEMA.GLOBAL_VARIABLES`. (Bug #20413, Bug #37187)

- Labels in stored routines did not work if the character set was not `latin1`. (Bug #7088)

- The grammar for `GROUP BY`, when used with `WITH CUBE` or `WITH ROLLUP`, caused a conflict with the grammar for view

definitions that included `WITH CHECK OPTION`. (Bug #9801)

- If a connection was waiting for a `GET_LOCK()` lock or a `SLEEP()` call, and the connection aborted, the server did not detect this and thus did not close the connection. This caused a waste of system resources allocated to dead connections. Now the server checks such a connection every five seconds to see whether it has been aborted. If so, the connection is killed (and any lock request is aborted). (Bug #10374)

- `perror` did not work for errors described in the `sql/share/errmsg.txt` file. (Bug #10143)

- For `CREATE TABLE`, the parser did not enforce that parentheses were present in a `CHECK (expr)` clause; now it does. The parser did not enforce that `CONSTRAINT [symbol]` without a following `CHECK` clause was illegal; now it does. (Bug #11714, Bug #35578, Bug #38696)

- For the `DIV` operator, incorrect results could occur for noninteger operands that exceed `BIGINT` range. Now, if either operand has a noninteger type, the operands are converted to `DECIMAL` and divided using `DECIMAL` arithmetic before converting the result to `BIGINT`. If the result exceeds `BIGINT` range, an error occurs. (Bug #8457, Bug #11745058)

  References: See also Bug #59241.

- Previously, for some Asian CJK character sets, the `UPPER()` and `LOWER()` functions worked only for basic Latin letters (`A-Z`, `a-z`). The affected character sets are `ujis`, `sjis`, `gb2312`, `cp932`, `eucjpms`, `big5`, `euckr`, and `gbk`.

  Now `UPPER()` and `LOWER()` perform case conversion correctly for all characters in these character sets, with the exception that if a character set contains a character in only one lettercase, conversion to the other lettercase cannot be done.

D.1.21. Changes in MySQL 5.5.2 (12 February 2010)

InnoDB Notes

- This release includes `InnoDB` 1.0.6. This version is considered of Release Candidate (RC) quality.

Functionality Added or Changed

- **Replication**: Introduced the `binlog_direct_non_transactional_updates` system variable. Enabling this variable causes updates using the statement-based logging format to tables using nontransactional engines to be written directly to the binary log, rather than to the transaction cache.

  Before enabling this variable, be certain that you have no dependencies between transactional and nontransactional tables. A statement that both selects from an `InnoDB` table and inserts into a `MyISAM` table is an example of such a dependency. For more information, see Section 15.1.3.4, “Binary Log Options and Variables”. (Bug #46364)

  References: See also Bug #28976, Bug #40116.

Bugs Fixed

- **Security Fix**: For servers built with yaSSL, a preauthorization buffer overflow could cause memory corruption or a server crash. We thank Evgeny Legerov from Intevydis for providing us with a proof-of-concept script that permitted us to reproduce this bug. (Bug #50227, CVE-2009-4484)

- **Performance**: **Partitioning**: When used on partitioned tables, the `records_in_range` handler call checked more partitions than necessary. The fix for this issue reduces the number of unpruned partitions checked for statistics in partition range checking, which has resulted in some partition operations being performed up to 2-10 times faster than before this change was made, when testing with tables having 1024 partitions. (Bug #48846)

  References: See also Bug #37252, Bug #47261.

- **Performance**: The `MD5()` and `SHA1()` functions had excessive overhead for short strings. (Bug #49491)

- **Performance**: The method for comparing `INFORMATION_SCHEMA` names and database names was nonoptimal and an improvement was made: When the database name length is already known, a length check is made first and content comparison skipped if the lengths are unequal. (Bug #49501)

- **Incompatible Change**: In `plugin.h`, the `MYSQL_REPLICATION_PLUGIN` symbol was out of synchrony with its value in MySQL 6.0 because the lower-valued `MYSQL_AUDIT_PLUGIN` was not present. To correct this, `MYSQL_AUDIT_PLUGIN` has been added in MySQL 5.5, changing the value of `MYSQL_REPLICATION_PLUGIN` from 5 to 6. Attempts to load the

audit plugin produce an error occurs because only the `MYSQL_AUDIT_PLUGIN` symbol was added, not the audit plugin itself. This error will go away when the audit plugin is added to MySQL 5.5 (in 5.5.3). Replication plugins from earlier 5.5.x releases must be recompiled against the current release before they will work with the current release. (Bug #49894)

- **Important Change**: **Replication**: The `RAND()` function is now marked as unsafe for statement-based replication. Using this function now generates a warning when `binlog_format=STATEMENT` and causes the format to switch to row-based logging when `binlog_format=MIXED`.

  This change is being introduced because, when `RAND()` was logged in statement mode, the seed was also written to the binary log, so the replication slave generated the same sequence of random numbers as was generated on the master. While this could make replication work in some cases, the order of affected rows was still not guaranteed when this function was used in statements that could update multiple rows, such as `UPDATE` or `INSERT ... SELECT`; if the master and the slave retrieved rows in different order, they began to diverge. (Bug #49222)

- **Partitioning**: **InnoDB Storage Engine**: When an `ALTER TABLE ... REORGANIZE PARTITION` statement on an `InnoDB` table failed due to `innodb_lock_wait_timeout` expiring while waiting for a lock, `InnoDB` did not clean up any temporary files or tables which it had created. Attempting to reissue the `ALTER TABLE` statement following the timeout could lead to storage engine errors, or possibly a crash of the server. (Bug #47343)

- **InnoDB Storage Engine**: Creating or dropping a table with 1023 transactions active caused an assertion failure. (Bug #49238)

- **InnoDB Storage Engine**: If `innodb_force_recovery` was set to 4 or higher, the server could crash when opening an `InnoDB` table containing an auto-increment column. MySQL versions 5.1.31 and later were affected. (Bug #46193)

- **Replication**: `FLUSH LOGS` could in some circumstances crash the server. This occurred because the I/O thread could concurrently access the relay log I/O cache while another thread was performing the `FLUSH LOGS`, which closes and reopens the relay log and, while doing so, initializes (or re-initializes) its I/O cache. This could cause problems if some other thread (in this case, the I/O thread) is accessing it at the same time.

  Now the thread performing the `FLUSH LOGS` operation takes a lock on the relay log before actually flushing it. (Bug #50364)

  References: See also Bug #53657.

- **Replication**: In some cases, inserting into a table with many columns could cause the binary log to become corrupted. (Bug #50018)

  References: See also Bug #42749.

- **Replication**: When using row-based replication, setting a `BIT` or `CHAR` column of a `MyISAM` table to `NULL`, then trying to delete from the table, caused the slave to fail with the error `Can't find record in table`. (Bug #49481, Bug #49482)

- **Replication**: When logging in row-based mode, DDL statements are actually logged as statements; however, statements that affected temporary tables and followed DDL statements failed to reset the binary log format to `ROW`, with the result that these statements were logged using the statement-based format. Now the state of `binlog_format` is restored after a DDL statement has been written to the binary log. (Bug #49132)

- **Replication**: When using row-based logging, the statement `CREATE TABLE t IF NOT EXIST ... SELECT` was logged as `CREATE TEMPORARY TABLE t IF NOT EXIST ... SELECT` when `t` already existed as a temporary table. This was caused by the fact that the temporary table was opened and the results of the `SELECT` were inserted into it when a temporary table existed and had the same name.

  Now, when this statement is executed, `t` is created as a base table, the results of the `SELECT` are inserted into it—even if there already exists a temporary table having the same name—and the statement is logged correctly. (Bug #47418)

  References: See also Bug #47442.

- **Replication**: Due to a change in the size of event representations in the binary log, when replicating from a MySQL 4.1 master to a slave running MySQL 5.0.60 or later, the `START SLAVE UNTIL` statement did not function correctly, stopping at the wrong position in the log. Now the slave detects that the master is using the older version of the binary log format, and corrects for the difference in event size, so that the slave stops in the correct position. (Bug #47142)

- **Replication**: A `LOAD DATA INFILE` statement that loaded data into a table having a column name that had to be quoted (such as `` `key` INT ``) caused replication to fail when logging in mixed or statement mode. In such cases, the master wrote the `LOAD DATA` event into the binary log without quoting the column name. (Bug #49479)

  References: See also Bug #47927. This bug is a regression of Bug #43746.

- **Replication**: Spatial data types caused row-based replication to crash. (Bug #48776)

- **Replication**: With semisynchronous replication, memory allocated for handling transactions could be freed while still in use, resulting in a server crash. (Bug #50157)

- **Replication**: Manually removing entries from the binary log index file on a replication master could cause the server to repeatedly send the same binary log file to slaves. (Bug #28421)
- The `printstack` function does not exist on Solaris 8 or earlier, which led to a compilation failure. (Bug #50409)
- If an invocation of a stored procedure failed in the table-open stage, subsequent invocations that did not fail in that stage could cause a crash. (Bug #47649)
- When the `mysql` client was invoked with the `--vertical` option, it ignored the `--skip-column-names` option. (Bug #47147)
- On Fedora 12, `strmov()` did not guarantee correct operation for overlapping source and destination buffer. Calls were fixed to use an overlap-safe version instead. (Bug #48866)
- Within a stored routine, selecting the result of `CONCAT_WS()` with a routine parameter argument into a user variable could return incorrect results. (Bug #50096)
- Several `strmake()` calls had an incorrect length argument (too large by one). (Bug #48983)
- Some prepared statements could raise an assertion when re-executed. (Bug #49570)
- `EXPLAIN EXTENDED UNION ... ORDER BY` caused a crash when the `ORDER BY` referred to a nonconstant or full-text function or a subquery. (Bug #49734)
- With one thread waiting for a lock on a table, if another thread dropped the table and created a new table with the same name and structure, the first thread did not notice that the table had been re-created and tried to used cached metadata that belonged to the old table but had been freed. (Bug #48157)
- The SSL certificates in the test suite were about to expire. They have been updated with expiration dates in the year 2015. (Bug #50642)
- Debug output for join structures was garbled. (Bug #50271)
- A user could see tables in `INFORMATION_SCHEMA.TABLES` without appropriate privileges for them. (Bug #50276)
- `mysql-test-run.pl` now recognizes the `MTR_TESTCASE_TIMEOUT`, `MTR_SUITE_TIMEOUT`, `MTR_SHUTDOWN_TIMEOUT`, and `MTR_START_TIMEOUT` environment variables. If they are set, their values are used to set the `--testcase-timeout`, `--suite-timeout`, `--shutdown-timeout`, and `--start-timeout` options, respectively. (Bug #49210)
- If `EXPLAIN` encountered an error in the query, a memory leak occurred. (Bug #45989)
- Mixing full-text searches and row expressions caused a crash. (Bug #49445)
- A crash occurred when a user variable that was assigned to a subquery result was used as a result field in a `SELECT` statement with aggregate functions. (Bug #47371)
- The `filesort` sorting method applied to a `CHAR(0)` column could lead to a server crash. (Bug #49897)
- `sql_buffer_result` had an effect on non-`SELECT` statements, contrary to the documentation. (Bug #49552)
- In some cases a subquery need not be evaluated because it returns only aggregate values that can be calculated from table metadata. This sometimes was not handled by the enclosing subquery, resulting in a server crash. (Bug #49512)
- `SPATIAL` indexes were permitted on columns with nonspatial data types, resulting in a server crash for subsequent table inserts. (Bug #50574)
- Index prefixes could be specified with a length greater than the associated column, resulting in a server crash for subsequent table inserts. (Bug #50542)
- Use of loose index scan optimization for an aggregate function with `DISTINCT` (for example, `COUNT(DISTINCT)`) could produce incorrect results. (Bug #50539)
- The server crashed when an `InnoDB` background thread attempted to write a message containing a partitioned table name to the error log. (Bug #50201)
- The optimizer could continue to execute a query after a storage engine reported an error, leading to a server crash. (Bug #46175)
- The `Table_locks_waited` waited variable was not incremented in the cases that a lock had to be waited for but the waiting thread was killed or the request was aborted. (Bug #30331)

- A race condition on the privilege hash tables permitted one thread to try to delete elements that had already been deleted by another thread. A consequence was that `SET PASSWORD` or `FLUSH PRIVILEGES` could cause a crash. (Bug #35589, Bug #35591)
- `ALTER TABLE` with both `DROP COLUMN` and `ADD COLUMN` clauses could crash or lock up the server. (Bug #31145)
- 1) In rare cases, if a thread was interrupted during a `FLUSH PRIVILEGES` operation, a debug assertion occurred later due to improper diagnostics area setup. 2) A `KILL` operation could cause a console error message referring to a diagnostic area state without first ensuring that the state existed. (Bug #33982)

D.1.22. Changes in MySQL 5.5.1 (04 January 2010)

When the publishing process for MySQL 5.5.1 was already running, the MySQL team was informed about a security problem in the SSL connect area (a possibility to crash the server). The problem is caused by a buffer overflow in the yaSSL library. MySQL Servers using OpenSSL are not affected; it can occur only when SSL (using yaSSL) is enabled.

This problem is under detailed investigation with the various versions, configurations, and platforms. When that has finished, the problem will be fixed as soon as possible, and new binaries for the affected versions will be released. However, building and testing these binaries in the various configurations on the various platforms will take some time. The bug is tracked with CVE ID CVE-2009-4484. We repeat the general security hint: If it is not *absolutely* necessary that external machines can connect to your database instance, we recommend that the server's connection port be blocked by a firewall to prevent any such illegitimate accesses.

Update: This bug is fixed in MySQL 5.5.2.

InnoDB Notes

- `InnoDB` has been upgraded to version 1.0.6. This version is considered of Release Candidate (RC) quality. Section 13.4.12, “InnoDB Storage Engine Change History”, may contain information in addition to those changes reported here.

RPM Notes

- The version information in RPM package files has been changed:
  - The “level” field of a MySQL version number is now also included in the RPM version and in the package file name.
  - The RPM “release” value now counts from 1, not 0.

  For example, the generic x86 server RPM file of 5.5.1-m2 is named `MySQL-server-5.5.1_m2-1.glibc23.i386.rpm`. This improves consistency with other formats that also include the level in the file name (for this version: “m2”). For example, the `tar.gz` file name is `mysql-5.5.1-m2-linux-i686-glibc23.tar.gz`. The different separator, underscore `'_'` for RPM, is required by the syntax of RPM.

Functionality Added or Changed

- **Partitioning**: The `UNIX_TIMESTAMP()` function is now supported in partitioning expressions using `TIMESTAMP` columns. For example, it now possible to create a partitioned table such as this one:

```
CREATE TABLE t (c TIMESTAMP)
PARTITION BY RANGE ( UNIX_TIMESTAMP(c) ) (
    PARTITION p0 VALUES LESS THAN (631148400),
    PARTITION p1 VALUES LESS THAN (946681200),
    PARTITION p2 VALUES LESS THAN (MAXVALUE)
);
```

  All other expressions involving `TIMESTAMP` values are now rejected with an error for attempts to create a new partitioned table or to alter an existing partitioned table.

  When accessing an existing partitioned table having a timezone-dependent partitioning function (where the table was using a previous version of MySQL), a warning rather than an error is issued. In such cases, you should fix the table. One way of doing this is to alter the table's partitioning expression so that it uses `UNIX_TIMESTAMP()`. (Bug #42849)

Bugs Fixed

- **Performance**: When the query cache is fragmented, the size of the free block lists in the memory bins grows, which causes query cache invalidation to become slow. There is now a 50ms timeout for a `SELECT` statement waiting for the query cache lock. If the timeout expires, the statement executes without using the query cache. (Bug #39253)

  References: See also Bug #21074.

- **Incompatible Change**: **Replication**: The file names for the semisynchronous plugins were prefixed with `lib`, unlike file names for other plugins. The file names no longer have a `lib` prefix.

  This change introduces an incompatibility if the plugins had been installed using the previous names. To handle this, uninstall the older version before installing the newer version. For example, use these statements for the master side plugins on Unix:

  ```
  mysql> UNINSTALL PLUGIN rpl_semi_sync_master;
  mysql> INSTALL PLUGIN rpl_semi_sync_master SONAME 'semisync_master.so';
  ```

  If you do not uninstall the older version first, attempting to install the newer version results in an error:

  ```
  mysql> INSTALL PLUGIN rpl_semi_sync_master SONAME 'semisync_master.so';
  ERROR 1125 (HY000): Function 'rpl_semi_sync_master' already exists
  ```

  For the slave side, similar statements apply:

  ```
  mysql> UNINSTALL PLUGIN rpl_semi_sync_slave;
  mysql> INSTALL PLUGIN rpl_semi_sync_slave SONAME 'semisync_slave.so';
  ```

- **Important Change**: **Replication**: The following functions have been marked unsafe for statement-based replication:

  - `GET_LOCK()`
  - `IS_FREE_LOCK()`
  - `IS_USED_LOCK()`
  - `MASTER_POS_WAIT()`
  - `RELEASE_LOCK()`
  - `SLEEP()`
  - `SYSDATE()`
  - `VERSION()`

  None of the functions just listed are guaranteed to replicate correctly when using the statement-based format because they can produce different results on the master and the slave. The use of any of these functions while `binlog_format` is set to `STATEMENT` is logged with the warning, `STATEMENT IS NOT SAFE TO LOG IN STATEMENT FORMAT`. When `binlog_format` is set to `MIXED`, the binary logging format is automatically switched to the row-based format whenever one of these functions is used. (Bug #47995)

- **Important Change**: After a binary upgrade to MySQL 5.1 from a MySQL 5.0 installation that contains `ARCHIVE` tables:

  - Before MySQL 5.1.42, accessing those tables will cause the server to crash, even if you have run `mysql_upgrade` or `CHECK TABLE ... FOR UPGRADE`.
  - As of MySQL 5.1.42, the server will not open 5.0 `ARCHIVE` tables at all.

  In either case, the solution is to use `mysqldump` to dump all 5.0 `ARCHIVE` tables before upgrading, and reload them into MySQL 5.1 after upgrading. The same problem occurs for binary downgrades from MySQL 5.1 to 5.0. (Bug #47012)

- **InnoDB Storage Engine**: When compiling on Windows, an error in the `CMake` definitions for `InnoDB` caused the engine to be built incorrectly. (Bug #49502)

- **Partitioning**: When `SHOW CREATE TABLE` was invoked for a table that had been created using the `COLUMNS` keyword or the `TO_SECONDS()` function, the output contained the wrong MySQL version number in the conditional comments. (Bug #49591)

- **Partitioning**: A query that searched on a `ucs2` column failed if the table was partitioned. (Bug #48737)

- **Partitioning**: In some cases, it was not possible to add a new column to a table that had subpartitions. (Bug #48276)

- **Partitioning**: `SELECT COUNT(*)` from a partitioned table failed when using the `ONLY_FULL_GROUP_BY` SQL mode.

(Bug #46923)

References: This bug was introduced by Bug #45807.

- **Partitioning**: `SUBPARTITION BY KEY` failed with `DEFAULT CHARSET=utf8`. (Bug #45904)
- **Replication**: When using row-based logging, `TRUNCATE TABLE` was written to the binary log even if the affected table was temporary, causing replication to fail. (Bug #48350)
- **Replication**: A flaw in the implementation of the purging of binary logs could result in orphaned files being left behind in the following circumstances:

  - If the server failed or was killed while purging binary logs.

    If the server failed or was killed after creating of a new binary log when the new log file was opened for the first time.

  In addition, if the slave was not connected during the purge operation, it was possible for a log file that was in use to be removed; this could lead data loss and possible inconsistencies between the master and slave. (Bug #45292)
- **Replication**: When using the `STATEMENT` or `MIXED` logging format, the statements `LOAD DATA CONCURRENT LOCAL INFILE` and `LOAD DATA CONCURRENT INFILE` were logged as `LOAD DATA LOCAL INFILE` and `LOAD DATA LOCAL INFILE`, respectively (in other words, the `CONCURRENT` keyword was omitted). As a result, when using replication with either of these logging modes, queries on the slaves were blocked by the replication SQL thread while trying to execute the affected statements. (Bug #34628)
- **Cluster Replication**: When `expire_logs_days` was set, the thread performing the purge of the log files could deadlock, causing all binary log operations to stop. (Bug #49536)
- Building MySQL on Fedora Core 12 64-bit failed, due to errors in `comp_err`. (Bug #48864)
- When running `mysql_secure_installation`, the command failed if the `root` password contained multiple space, `'\'`, `'#'`, or quote characters. (Bug #48031)
- On Windows, `InnoDB` could not be built as a statically linked library. (Bug #48317)
- Valgrind errors for `InnoDB` were corrected. (Bug #45992, Bug #46656)
- Assignment of a system variable sharing the same base name as a declared stored program variable in the same context could lead to a crash. (Bug #47627)
- Privileges for stored routines were ignored for mixed-case routine names. (Bug #48872)

  References: See also Bug #41049.
- `DISTINCT` was ignored for queries with `GROUP BY WITH ROLLUP` and only `const` tables. (Bug #48475)
- Loose index scan was inappropriately chosen for some `WHERE` conditions. (Bug #48472)
- The `innodb_file_format_check` system variable could not be set at runtime to `DEFAULT` or to the value of a user-defined variable. (Bug #47167)
- Concurrent `ALTER TABLE` operations on an `InnoDB` table could raise an assertion. (Bug #48782)
- During query execution, ranges could be merged incorrectly for `OR` operations and return an incorrect result. (Bug #48665)
- The `InnoDB` Table Monitor reported the `FLOAT` and `DOUBLE` data types incorrectly. (Bug #48526)
- With row-based binary logging, the server crashed for statements of the form `CREATE TABLE IF NOT EXISTS existing_view LIKE temporary_table`. This occurred because the server handled the existing view as a table when logging the statement. (Bug #48506)
- A bad typecast could cause query execution to allocate large amounts of memory. (Bug #48458)
- `MATCH IN BOOLEAN MODE` searches could return too many results inside a subquery. (Bug #47930)
- Connecting to a 4.1.x server from a 5.1.x or higher `mysql` client resulted in a memory-free error when disconnecting. (Bug #47655)
- `mysql_secure_installation` did not work on Solaris. (Bug #48086)
- Parts of the range optimizer could be initialized incorrectly, resulting in Valgrind errors. (Bug #48459)

- The server could crash and corrupt the tablespace if the `InnoDB` tablespace was configured with too small a value, or if `innodb_file_per_table` was enabled and many `CREATE TEMPORARY TABLE` statements were executed and the temporary file directory filled up. (Bug #48469)
- The `mysql` client `status` command displayed an incorrect value for the server character set. (Bug #47671)
- The `IGNORE` clause on a `DELETE` statement masked an SQL statement error that occurred during trigger processing. (Bug #46425)
- If a session acquired a global read lock with `FLUSH TABLES WITH READ LOCK`, acquired a lock for one table with `LOCK TABLES`, and issued an `INSERT DELAYED` statement for another table, deadlock could occur. (Bug #47682)
- The return value was not checked for some `my_hash_insert()` calls. (Bug #45613)
- User-defined collations with an ID less than 256 were not initialized correctly when loaded and caused a server crash. (Bug #47756)
- The result of comparison between nullable `BIGINT` and `INT` columns was inconsistent. (Bug #49517)
- Incorrect cache initialization prevented storage of converted constant values and could produce incorrect comparison results. (Bug #49489)
- Comparisons involving `YEAR` values could produce incorrect results. (Bug #49480)

  References: See also Bug #43668.
- If a query involving a table was terminated with `KILL`, a subsequent `SHOW CREATE TABLE` for that table caused a server crash. (Bug #48985)
- A Valgrind error in `make_cond_for_table_from_pred()` was corrected. Thanks to Sergey Petrunya for the patch to fix this bug. (Bug #49506)
- Valgrind warnings for `CHECKSUM TABLE` were corrected. (Bug #49465)
- The `mysql.server` script had incorrect shutdown logic. (Bug #49772)
- On Solaris, the server printed no stack trace to the error log after a crash. (Bug #47391)
- The error message for `ER_UPDATE_INFO` was subject to buffer overflow or truncation. (Bug #48500)
- Specifying an index algorithm (such as `BTREE`) for `SPATIAL` or `FULLTEXT` indexes caused a server crash. These index types do not support algorithm specification, and it is not longer permitted to do so. (Bug #49250)
- The optimizer sometimes incorrectly handled conditions of the form `WHERE col_name='const1' AND col_name='const2'`. (Bug #49199)
- The `LIKE` operator did not work correctly when using an index for a `ucs2` column. (Bug #49028)
- Execution of `DECODE()` and `ENCODE()` could be inefficient because multiple executions within a single statement reinitialized the random generator multiple times even with constant parameters. (Bug #49141)
- `check_key_in_view()` was missing a `DBUG_RETURN` in one code branch, causing a crash in debug builds. (Bug #48995)
- For debug builds on Windows, `SAFEMALLOC` was defined inconsistently, leading to mismatches when using `my_malloc()` and `my_free()`. (Bug #49811)
- It was possible for `init_available_charsets()` not to initialize correctly. (Bug #45058)
- With binary logging enabled, `REVOKE ... ON {PROCEDURE|FUNCTION} FROM ...` could cause a crash. (Bug #49119)
- Re-execution of a prepared statement could cause a server crash. (Bug #48508)
- `SHOW BINLOG EVENTS` could fail with a error: `Wrong offset or I/O error`. (Bug #48357)
- Valgrind warnings related to binary logging of `LOAD DATA INFILE` statements were corrected. (Bug #48340)
- The first execution of `STOP SLAVE UNTIL` stopped too early. (Bug #47210)
- Incomplete reset of internal `TABLE` structures could cause a crash with `eq_ref` table access in subqueries. (Bug #48709)
- The `push_warning_printf()` function was being called with an invalid error level,

`MYSQL_ERROR::WARN_LEVEL_ERROR`, causing an assertion failure. To fix the problem, `MYSQL_ERROR::WARN_LEVEL_ERROR` has been replaced by `MYSQL_ERROR::WARN_LEVEL_WARN`. (Bug #49638)

- Queries containing `GROUP BY ... WITH ROLLUP` that did not use indexes could return incorrect results. (Bug #47650)
- Use of `InnoDB` monitoring (`SHOW ENGINE INNODB STATUS` or one of the `InnoDB` Monitor tables) could cause a server crash due to invalid access to a shared variable in a concurrent environment. (Bug #38883)
- `GROUP BY` on a `constant` (single-row) `InnoDB` table joined to other tables caused a server crash. (Bug #44886)
- For `YEAR(2)` values, `MIN()`, `MAX()`, and comparisons could yield incorrect results. (Bug #43668)
- The server could crash when attempting to access a non-conformant `mysql.proc` system table. For example, the server could crash when invoking stored procedure-related statements after an upgrade from MySQL 5.0 to 5.1 without running `mysql_upgrade`. (Bug #41726)
- Comparison with `NULL` values sometimes did not produce a correct result. (Bug #42760)
- The `mysql_upgrade` command added three columns to the `mysql.proc` table (`character_set_client`, `collation_connection`, and `db_collation`), but did not populate the columns with correct values. This led to error messages reported during stored procedure execution. (Bug #41569)
- When compressed `MyISAM` files were opened, they were always memory mapped, sometimes causing memory-swapping problems. To deal with this, a new system variable, `myisam_mmap_size`, was added to permit limiting the amount of memory used for memory mapping of `MyISAM` files. (Bug #37408)
- In debug builds, killing a `LOAD XML INFILE` statement raised an assertion.

  Implemented in the course of fixing this bug, `mysqltest` has a new `send_eval` command that combines the functionality of the existing `send` and `eval` commands. (Bug #42520)
- For a `VARCHAR(N)` column, `ORDER BY BINARY(col_name)` sorted using only the first *`N`* bytes of the column, even though column values could be longer than *`N`* bytes if they contained multibyte characters. (Bug #44131)
- On Windows, the `mysql_secure_installation` command failed to load the `Term::ReadKey` module, which was required for correct operation. (Bug #35106)
- If the `--log-bin` server option was set to a directory name with a trailing component separator character, the basename of the binary log files was empty, so that the created files were named `.000001` and `.index`. The same thing occurred with the `--log-bin-index`, `--relay-log`, and `--relay-log-index` options. Now the server reports and error and exits. (Bug #34739)
- If a comparison involved a constant value that required type conversion, the converted value might not be cached, resulting in repeated conversion and poorer performance. (Bug #34384)
- Using the `SHOW ENGINE INNODB STATUS` statement when using partitions in `InnoDB` tables caused `Invalid (old?) table or database name` errors to be logged. (Bug #32430)
- Under heavy load with a large query cache, invalidating part of the cache could cause the server to freeze (that is, to be unable to service other operations until the invalidation was complete). (Bug #21074)

  References: See also Bug #39253.
- Output from `mysql --html` did not encode the `'<'`, `'>'`, or `'&'` characters. (Bug #27884)
- On some Windows systems, `InnoDB` could report `Operating system error number 995 in a file operation` due to transient driver or hardware problems. `InnoDB` now retries the operation and adds `Retry attempt is made` to the error message. (Bug #3139)

D.1.23. Changes in MySQL 5.5.0 (07 December 2009, Milestone 2)

Previously, MySQL development proceeded by including a large set of features and moving them over many versions within a release series through several stages of maturity (Alpha, Beta, and so forth). This development model had a disadvantage in that problems with only part of the code could hinder timely release of the whole. As you might have found when testing MySQL Server 6.0, alpha quality code could jeopardize the stability of the entire release. (One consequence of this was that MySQL Server 6.0 has been withdrawn.)

MySQL development now uses a milestone model. The move to this model provides for more frequent milestone releases, with each milestone proceeding through a small number of releases having a focus on a specific subset of thoroughly tested features.

Following the releases for one milestone, development proceeds with the next milestone; that is, another small number of releases that focuses on the next small set of features, also thoroughly tested.

MySQL 5.5.0-m2 is the first release for Milestone 2. The new features of this milestone may be considered to be initially of beta quality. For subsequent Milestone 2 releases, we plan to use increasing version numbers (5.5.1 and higher) while continuing to employ the "-m2" suffix. For Milestone 3, we plan to change the suffix to "-m3". Version designators with "-alpha" or "-beta" suffixes are no used.

You may notice that the MySQL 5.5.0 release is designated as Milestone 2 rather than Milestone 1. This is because MySQL 5.4 was actually designated as Milestone 1, although we had not yet begun referring to milestone numbers as part of version numbers at the time.

InnoDB Notes

- The `InnoDB Plugin` is included in MySQL 5.5 releases as the built-in version of `InnoDB`. The version of the `InnoDB` in this release is 1.0.5 and is considered of Release Candidate (RC) quality.

  This version of `InnoDB` offers new features, improved performance and scalability, enhanced reliability and new capabilities for flexibility and ease of use. Among the features are "Fast index creation," table and index compression, file format management, new `INFORMATION_SCHEMA` tables, capacity tuning, multiple background I/O threads, and group commit.

  For information about these features, see InnoDB Plugin 1.0 for MySQL 5.1 User's Guide. For general information about using `InnoDB` in MySQL, see Section 13.3, "The `InnoDB` Storage Engine".

  In this version of `InnoDB`, the `innodb_file_io_threads` system variable has been removed and replaced with `innodb_read_io_threads` and `innodb_write_io_threads`. If you upgrade from MySQL 5.1 to MySQL 5.5 and previously explicitly set `innodb_file_io_threads` at server startup, you must change your configuration. Either remove any reference to `innodb_file_io_threads` or replace it with references to `innodb_read_io_threads` and `innodb_write_io_threads`.

Functionality Added or Changed

- **Incompatible Change**: MySQL Server now includes a plugin services interface that complements the plugin API. The services interface enables server functionality to be exposed as a "service" that plugins can access using function calls. The `libmysqlservices` library provides access to the available services and dynamic plugins now must be linked against this library (use the `-lmysqlservices` flag). See Section 22.2.5, "MySQL Services for Plugins". (Bug #48461)
- **Incompatible Change**: Two status variables have been added to `SHOW STATUS` output. `Innodb_buffer_pool_read_ahead` and `Innodb_buffer_pool_read_ahead_evicted` indicate the number of pages read in by the `InnoDB` read-ahead background thread, and the number of such pages evicted without ever being accessed, respectively. Also, the status variables `Innodb_buffer_pool_read_ahead_rnd` and `Innodb_buffer_pool_read_ahead_seq` status variables have been removed. (Bug #42885)
- **Incompatible Change**: The deprecated `--default-table-type` server option has been removed (use `--default-storage-engine`). (Bug #34818)
- **Incompatible Change**: The `TRADITIONAL` SQL mode now includes `NO_ENGINE_SUBSTITUTION`. (Bug #21099)
- **Incompatible Change**: Several changes have been made regarding the language and character set of error messages:

  - The `language` system variable has been removed and replaced with the new `lc_messages_dir` and `lc_messages` system variables. `lc_messages_dir` has only a global value and is read only. `lc_messages` has global and session values and can be modified at runtime, so the error message language can be changed while the server is running, and individual clients each can have a different error message language by changing their session `lc_messages` value to a different locale name.
  - The `--language` option for specifying the directory for the error message file is now deprecated. The new `lc_messages_dir` and `lc_messages` system variables should be used instead, and the server treats `--language` as an alias for `lc_messages_dir`.
  - Error messages previously were constructed in a mix of character sets. This issue is resolved by constructing error messages internally within the server using UTF-8 and returning them to the client in the character set specified by the `character_set_results` system variable. The content of error messages therefore may in some cases differ from the messages returned previously.

  See Section 9.2, "Setting the Error Message Language", and Section 9.1.6, "Character Set for Error Messages".

  References: See also Bug #46218, Bug #46236.

- **Partitioning**: It is now possible to assign indexes on partitioned `MyISAM` tables to key caches using the `CACHE INDEX` and to preload such indexes into the cache using `LOAD INDEX INTO CACHE` statements. Cache assignment and preloading of indexes for such tables can be performed for one, several, or all partitions of the table.

  This functionality is supported for only those partitioned tables that employ the `MyISAM` storage engine.

- **Partitioning**: A new `ALTER TABLE` option, `TRUNCATE PARTITION`, makes it possible to delete rows from one or more selected partitions only. Unlike the case with `ALTER TABLE ... DROP PARTITION`, `ALTER TABLE ... TRUNCATE PARTITION` merely deletes all rows from the specified partition or partitions, and does not change the definition of the table.

- **Partitioning**: New `PARTITION BY RANGE COLUMNS(column_list)` and `PARTITION BY LIST COLUMNS(column_list)` options are added for the `CREATE TABLE` and `ALTER TABLE` statements.

  A major benefit of `RANGE COLUMNS` and `LIST COLUMNS` partitioning is that they make it possible to define ranges or lists based on column values that use string, date, or datetime values.

  These new extensions also broaden the scope of partition pruning to provide better coverage for queries using comparisons on multiple columns in the `WHERE` clause, some examples being `WHERE a = 1 AND b < 10` and `WHERE a = 1 AND b = 10 AND c < 10`.

  See Section 17.2.1, “`RANGE` Partitioning”, Section 17.2.2, “`LIST` Partitioning”, and Section 17.4, “Partition Pruning”.

- **Replication**: Because `SHOW BINLOG EVENTS` cannot be used to read events from relay log files, a new `SHOW RELAYLOG EVENTS` statement has been added for this purpose. (Bug #28777)

- **Replication**: The global server variable `sync_relay_log` is introduced for use on replication slaves. Setting this variable to a nonzero integer value *`N`* causes the slave to synchronize the relay log to disk after every *`N`* events. Setting its value to 0 permits the operating system to handle synchronization of the file. The action of this variable, when enabled, is analogous to how the `sync_binlog` variable works with regard to binary logs on a replication master.

  The global server variables `sync_master_info` and `sync_relay_log_info` are introduced for use on replication slaves to control synchronization of, respectively, the `master.info` and `relay.info` files.

  In each case, setting the variable to a nonzero integer value *`N`* causes the slave to synchronize the corresponding file to disk after every *`N`* events. Setting its value to 0 permits the operating system to handle synchronization of the file instead.

  The actions of these variables, when enabled, are analogous to how the `sync_binlog` variable works with regard to binary logs on a replication master.

  An additional system variable `relay_log_recovery` is also now available. When enabled, this variable causes a replication slave to discard relay log files obtained from the replication master following a crash.

  These variables can also be set in `my.cnf`, or by using the `--sync-relay-log`, `--sync-master-info`, `--sync-relay-log-info`, and `--relay-log-recovery` server options.

  For more information, see Section 15.1.3.3, “Replication Slave Options and Variables”. (Bug #31665, Bug #35542, Bug #40337)

- **Replication**: In circular replication, it was sometimes possible for an event to propagate such that it would be reapplied on all servers. This could occur when the originating server was removed from the replication circle and so could no longer act as the terminator of its own events, as normally happens in circular replication.

  To prevent this from occurring, a new `IGNORE_SERVER_IDS` option is introduced for the `CHANGE MASTER TO` statement. This option takes a list of replication server IDs; events having a server ID which appears in this list are ignored and not applied. For more information, see Section 12.4.2.1, “`CHANGE MASTER TO` Syntax”.

  In conjunction with the introduction of `IGNORE_SERVER_IDS`, `SHOW SLAVE STATUS` has two new fields. `Replicate_Ignore_Server_Ids` displays information about ignored servers. `Master_Server_Id` displays the `server_id` value from the master. (Bug #25998)

  References: See also Bug #27808.

- **Replication**: A replication heartbeat mechanism has been added to facilitate monitoring. This provides an alternative to checking log files, making it possible to detect in real time when a slave has failed.

  Configuration of heartbeats is done using a new `MASTER_HEARTBEAT_PERIOD = interval` clause for the `CHANGE MASTER TO` statement (see Section 12.4.2.1, “`CHANGE MASTER TO` Syntax”); monitoring can be done by checking the values of the status variables `Slave_heartbeat_period` and `Slave_received_heartbeats` (see Section 5.1.5, “Server Status Variables”).

  The addition of replication heartbeats addresses a number of issues:

  - Relay logs were rotated every `slave_net_timeout` seconds even if no statements were being replicated.
  - `SHOW SLAVE STATUS` displayed an incorrect value for `Seconds_Behind_Master` following a `FLUSH LOGS` statement.
  - Replication master-slave connections used `slave_net_timeout` for connection timeouts.

  (Bug #20435, Bug #29309, Bug #30932)

- **Replication**: MySQL now supports an interface for semisynchronous replication: A commit performed on the master side blocks before returning to the session that performed the transaction until at least one slave acknowledges that it has received and logged the events for the transaction. Semisynchronous replication is implemented through an optional plugin component. See Section 15.3.8, “Semisynchronous Replication”.

- On Linux (and perhaps other systems), the performance of MySQL Server can be improved by using a different `malloc()` implementation, developed by Google and called `tcmalloc`. The gain is noticeable with a higher number of simultaneous users. To support use of this library, the following changes have been made:

  - The server is linked against the default `malloc()` provided by the respective platform.
  - Binary distributions for Linux include `libtcmalloc_minimal.so` (a shared library that can be linked against at runtime) in `pkglibdir` (that is, the same directory within the package where server plugins and similar object files are located). The version of `tcmalloc` included with MySQL comes from `google-perftools` 1.4.

    If you want to try `tcmalloc` but are using a binary distribution for a non-Linux platform or a source distribution, you can install Google's `tcmalloc`. Some distributions provide it in a `google-perftools` package or with a similar name, or you can download it from Google at http://code.google.com/p/google-perftools/ and compile it yourself.
  - `mysqld_safe` now supports a `--malloc-lib` option that enables administrators to specify that `mysqld` should use `tcmalloc`.

  The `--malloc-lib` option works by modifying the `LD_PRELOAD` environment value to affect dynamic linking to enable the loader to find the memory-allocation library when `mysqld` runs:

  - If the option is not given, or is given without a value (`--malloc-lib=`), `LD_PRELOAD` is not modified and no attempt is made to use `tcmalloc`.
  - If the option is given as `--malloc-lib=tcmalloc`, `mysqld_safe` looks for a `tcmalloc` library in `/usr/lib` and then in the MySQL `pkglibdir` location (for example, `/usr/local/mysql/lib` or whatever is appropriate). If `tmalloc` is found, its path name is added to the beginning of the `LD_PRELOAD` value for `mysqld`. If `tcmalloc` is not found, `mysqld_safe` aborts with an error.
  - If the option is given as `--malloc-lib=/path/to/some/library`, that full path is added to the beginning of the `LD_PRELOAD` value. If the full path points to a nonexistent or unreadable file, `mysqld_safe` aborts with an error.
  - For cases where `mysqld_safe` adds a path name to `LD_PRELOAD`, it adds the path to the beginning of any existing value the variable already has.

  As a result of the preceding changes, Linux users can use the `libtcmalloc_minimal.so` now included in binary packages by adding these lines to the `my.cnf` file:

```
[mysqld_safe]
malloc-lib=tcmalloc
```

  Those lines also suffice for users on any platform who have installed a `tcmalloc` package in `/usr/lib`. To use a specific `tcmalloc` library, specify its full path name. Example:

```
[mysqld_safe]
malloc-lib=/opt/lib/libtcmalloc_minimal.so
```

  (Bug #47549)

- The `mysql` client now supports an `--init-command=str` option. The option value is an SQL statement to execute after connecting to the server. If auto-reconnect is enabled, the statement is executed again after reconnection occurs. (Bug #45634, Bug #11754087)

- The `have_community_features` system variable was renamed to `have_profiling`.

  Previously, to enable profiling, it was necessary to run `configure` with the `--enable-community-features` and `--enable-profiling` options. Now only `--enable-profiling` is needed. (Bug #44651)

- The `InnoDB` buffer pool is divided into two sublists: A new sublist containing blocks that are heavily used by queries, and an old sublist containing less-used blocks and from which candidates for eviction are taken. In the default operation of the buffer pool, a block when read in is loaded at the midpoint and then moved immediately to the head of the new sublist as soon as an access occurs. In the case of a table scan (such as performed for a `mysqldump` operation), each block read by the scan ends up moving to the head of the new sublist because multiple rows are accessed from each block. This occurs even for a one-time scan, where the blocks are not otherwise used by other queries. Blocks may also be loaded by the read-ahead background thread and then moved to the head of the new sublist by a single access. These effects can be disadvantageous because they push blocks that are in heavy use by other queries out of the new sublist to the old sublist where they become subject to eviction.

  `InnoDB` now provides two system variables that enable LRU algorithm tuning:

  - `innodb_old_blocks_pct`

    Specifies the approximate percentage of the buffer pool used for the old block sublist. The range of values is 5 to 95. The default value is 37 (that is, 3/8 of the pool).

  - `innodb_old_blocks_time`

    Specifies how long in milliseconds (ms) a block inserted into the old sublist must stay there after its first access before it can be moved to the new sublist. The default value is 0: A block inserted into the old sublist moves immediately to the new sublist the first time it is accessed, no matter how soon after insertion the access occurs. If the value is greater than 0, blocks remain in the old sublist until an access occurs at least that many ms after the first access. For example, a value of 1000 causes blocks to stay in the old sublist for 1 second after the first access before they become eligible to move to the new sublist.

  See Section 7.9.1, "The InnoDB Buffer Pool". (Bug #45015)

- Several undocumented C API functions were removed: `mysql_manager_close()`, `mysql_manager_command()`, `mysql_manager_connect()`, `mysql_manager_fetch_line()`, `mysql_manager_init()`, `mysql_disable_reads_from_master()`, `mysql_disable_rpl_parse()`, `mysql_enable_reads_from_master()`, `mysql_enable_rpl_parse()`, `mysql_master_query()`, `mysql_master_send_query()`, `mysql_reads_from_master_enabled()`, `mysql_rpl_parse_enabled()`, `mysql_rpl_probe()`, `mysql_rpl_query_type()`, `mysql_set_master()`, `mysql_slave_query()`, and `mysql_slave_send_query()`. (Bug #31952, Bug #31954)

- Columns that provide a catalog value in `INFORMATION_SCHEMA` tables (for example, `TABLES.TABLE_CATALOG`) now have a value of `def` rather than `NULL`. (Bug #35427)

- Previously, `mysqldump` would not dump the `INFORMATION_SCHEMA` database and ignored it if it was named on the command line. Now, `mysqldump` will dump `INFORMATION_SCHEMA` if it is named on the command line. Currently, this requires that the `--skip-lock-tables` (or `--skip-opt`) option be given. (Bug #33762)

- If the value of the `--log-warnings` option is greater than 1, the server now writes access-denied errors for new connection attempts to the error log (for example, if a client user name or password is incorrect). (Bug #25822)

- Sinhala collations `utf8_sinhala_ci` and `ucs2_sinhala_ci` were added for the `utf8` and `ucs2` character sets. (Bug #26474)

- On Windows, use of POSIX I/O interfaces in `mysys` was replaced with Win32 API calls (`CreateFile()`, `WriteFile()`, and so forth) and the default maximum number of open files has been increased to 16384. The maximum can be increased further by using the `--open-files-limit=N` option at server startup. (Bug #24509)

- The undocumented, deprecated, and not useful `SHOW COLUMN TYPES` statement has been removed. (Bug #5299)

- MySQL now implements the SQL standard `SIGNAL` and `RESIGNAL` statements. See Section 12.6.7, "Condition Handling". (Bug #11661)

- The `LOAD XML INFILE` statement was added. This statement makes it possible to read data directly from XML files into database tables. For more information, see Section 12.2.7, "`LOAD XML` Syntax".

- Parser performance was improved for identifier scanning and conversion of ASCII string literals.

- Added the `TO_SECONDS()` function, which converts a date or datetime value to a number of seconds since the year 0. This is a general-purpose function, but is useful for partitioning. You may use this function in partitioning expressions, and partition pruning is supported for tables defined using such expressions.

- The server now supports a Debug Sync facility for thread synchronization during testing and debugging. To compile in this facility, configure MySQL with the `--enable-debug-sync` option. The `debug_sync` system variable provides the user interface Debug Sync. `mysqld` and `mysql-test-run.pl` support a `--debug-sync-timeout` option to enable the facility and set the default synchronization point timeout.

- The `CREATE TABLESPACE` privilege has been introduced. This privilege exists at the global (superuser) level and enables you to create, alter, and drop tablespaces and logfile groups.

- `mysql_upgrade` now has an `--upgrade-system-tables` option that causes only the system tables to be upgraded. With this option, data upgrades are not performed.

- Previously, in the absence of other information, the MySQL client programs `mysql`, `mysqladmin`, `mysqlcheck`, `mysqlimport`, and `mysqlshow` used the compiled-in default character set, usually `latin1`.

  Now these clients can autodetect which character set to use based on the operating system setting, such as the value of the `LANG` or `LC_ALL` locale environment language on Unix system or the code page setting on Windows systems. For systems on which the locale is available from the OS, the client uses it to set the default character set rather than using the compiled-in default. Thus, users can configure the locale in their environment for use by MySQL clients. For example, setting `LANG` to `ru_RU.KOI8-R` causes the `koi8r` character set to be used. The OS character set is mapped to the closest MySQL character set if there is no exact match. If the client does not support the matching character set, it uses the compiled-in default. (For example, `ucs2` is not supported as a connection character set.)

  An implication of this change is that if your environment is configured to use a non-`latin1` locale, MySQL client programs will use a different connection character set than previously, as though you had issued an implicit `SET NAMES` statement. If the previous behavior is required, start the client with the `--default-character-set=latin1` option.

  Third-party applications that wish to use character set autodetection based on the OS setting can use the following `mysql_options()` call before connecting to the server:

```
mysql_options(mysql,
              MYSQL_SET_CHARSET_NAME,
              MYSQL_AUTODETECT_CHARSET_NAME);
```

  See Section 9.1.4, “Connection Character Sets and Collations”.

- The Greek locale `'el_GR'` is now a permissible value for the `lc_time_names` system variable.

- The `FORMAT()` function now supports an optional third parameter that enables a locale to be specified to be used for the result number's decimal point, thousands separator, and grouping between separators. Permissible locale values are the same as the legal values for the `lc_time_names` system variable (see Section 9.7, “MySQL Server Locale Support”). For example, the result from `FORMAT(1234567.89,2,'de_DE')` is `1.234.567,89`. If no locale is specified, the default is `'en_US'`.

- The `libmysqlclient` client library is now built as a thread-safe library. The `libmysqlclient_r` client library is still present for compatibility, but is just a symlink to `libmysqlclient`.

Bugs Fixed

- **Important Change**: **Security Fix**: It was possible to circumvent privileges through the creation of `MyISAM` tables employing the `DATA DIRECTORY` and `INDEX DIRECTORY` options to overwrite existing table files in the MySQL data directory. Use of the MySQL data directory in `DATA DIRECTORY` and `INDEX DIRECTORY` is no longer permitted. This is now also true of these options when used with partitioned tables and individual partitions of such tables. (Bug #32167, CVE-2008-2079)

  References: See also Bug #39277.

- **Security Fix**: MySQL clients linked against OpenSSL could be tricked not to check server certificates. (Bug #47320, CVE-2009-4028)

- **Security Fix**: The server crashed if an account without the proper privileges attempted to create a stored procedure. (Bug #44658)

- **Performance**: The server unnecessarily acquired a query cache mutex even with the query cache disabled, resulting in a small performance decrement which could show up as threads often in the “invalidating query cache entries (table)” state, particularly on a replication slave with row-based replication. Now if the server is started with `query_cache_type` set to 0, it does not acquire the query cache mutex. This has the implication that the query cache cannot be enabled at runtime. (Bug #38551)

- **Performance**: The `InnoDB` adaptive hash latch is released (if held) for several potentially long-running operations. This improves throughput for other queries if the current query is removing a temporary table, changing a temporary table from memory to disk, using `CREATE TABLE ... SELECT`, or performing a `MyISAM` repair on a table used within a transaction. (Bug #32149)

- **Incompatible Change**: **Replication**: Concurrent transactions that inserted rows into a table with an `AUTO_INCREMENT` column could break statement-based or mixed-format replication error 1062 `Duplicate entry '...' for key 'PRIMARY'` on the slave. This was especially likely to happen when one of the transactions activated a trigger that inserted rows into the table with the `AUTO_INCREMENT` column, although other conditions could also cause the issue to manifest.

As part of the fix for this issue, any statement that causes a trigger or function to update an `AUTO_INCREMENT` column is now considered unsafe for statement-based replication. For more information, see Section 15.4.1.1, "Replication and `AUTO_INCREMENT`". (Bug #45677)

References: See also Bug #42415, Bug #48608, Bug #50440, Bug #53079.

- **Incompatible Change**: In binary installations of MySQL, the supplied `binary-configure` script would start and configure MySQL, even when command help was requested with the `--help` command-line option. The `--help` option, if provided, no longer starts and installs the server. (Bug #30954)

- **Incompatible Change**: For system variables that take values of `ON` or `OFF`, `OF` was accepted as a legal variable. Now system variables that take "enumeration" values must be assigned the full value. This affects some other variables that previously could be assigned using unambiguous prefixes of permissible values, such as `tx_isolation`. (Bug #34828)

- **Incompatible Change**: Access privileges for several statements are more accurately checked:

  - `CHECK TABLE` requires some privilege for the table.
  - `CHECKSUM TABLE` requires `SELECT` for the table.
  - `CREATE TABLE ... LIKE` requires `SELECT` for the source table and `CREATE` for the destination table.
  - `SHOW COLUMNS` displays information only for those columns for which you have some privilege.
  - `SHOW CREATE TABLE` requires some privilege for the table (previously required `SELECT`).
  - `SHOW CREATE VIEW` requires `SHOW VIEW` and `SELECT` for the view.
  - `SHOW INDEX` requires some privilege for any column.
  - `SHOW OPEN TABLES` displays only tables for which you have some privilege on any column.

  (Bug #27145)

- **Important Change**: **Replication**: `MyISAM` transactions replicated to a transactional slave left the slave in an unstable condition. This was due to the fact that, when replicating from a nontransactional storage engine to a transactional engine with `autocommit` disabled, no `BEGIN` and `COMMIT` statements were written to the binary log; thus, on the slave, a never-ending transaction was started.

  The fix for this issue includes enforcing `autocommit` mode on the slave by replicating all `autocommit=1` statements from the master. (Bug #29288)

- **Important Change**: **Replication**: The `CHANGE MASTER TO` statement required the value for `RELAY_LOG_FILE` to be an absolute path, whereas the `MASTER_LOG_FILE` path could be relative.

  The inconsistent behavior is resolved by permitting relative paths for `RELAY_LOG_FILE`, and by using the same basename for `RELAY_LOG_FILE` as for `MASTER_LOG_FILE`. For more information, see Section 12.4.2.1, "`CHANGE MASTER TO` Syntax". (Bug #12190, Bug #11745232)

- **Important Change**: An option that requires a value, when specified in an option file without a value, was assigned the text of the next line in the file as the value. Now, if you fail to specify a required value in an option file, the server aborts with an error.

  This change does not effect how options are handled by the server when they are used on the command line. For example, starting the server using `mysqld_safe --relay-log --relay-log-index &` causes the server to create relay log files named `--relay-log-index.000001`, `--relay-log-index.000002`, and so on, because the `--relay-log` option expects an argument. (Bug #25192)

- **Partitioning**: An `ALTER TABLE ... ADD PARTITION` statement that caused `open_files_limit` to be exceeded led to a MySQL server crash. (Bug #46922)

  References: See also Bug #47343.

- **Partitioning**: When performing an `INSERT ... SELECT` into a partitioned table, `read_buffer_size` bytes of memory were allocated for every partition in the target table, resulting in consumption of large amounts of memory when the table had many partitions (more than 100).

  This fix changes the method used to estimate the buffer size required for each partition and limits the total buffer size to a maximum of approximately 10 times `read_buffer_size`. (Bug #45840)

- **Partitioning**: The cardinality of indexes on partitioned tables was calculated using the first partition in the table, which could

result in suboptimal query execution plans being chosen. Now the partition having the most records is used instead, which should result in better use of indexes and thus improved performance of queries against partitioned tables in many if not most cases. (Bug #44059)

- **Partitioning**: For partitioned tables with more than ten partitions, a full table scan was used in some cases when only a subset of the partitions were needed. (Bug #33730)

- **Partitioning**: Truncating a partitioned `MyISAM` table did not reset the `AUTO_INCREMENT` value. (Bug #35111)

- **Replication**: When using the row-based format to replicate a transaction involving both transactional and nontransactional engines, which contained a DML statement affecting multiple rows, the statement failed. If this transaction was followed by a `COMMIT`, the master and the slave could diverge, because the statement was correctly rolled back on the master, but was applied on the slave. (Bug #47287)

  References: See also Bug #46864.

- **Replication**: A problem with the `BINLOG` statement in the output of `mysqlbinlog` could break replication; statements could be logged with the server ID stored within events by the `BINLOG` statement rather than the ID of the running server. With this fix, the server ID of the server executing the statements can no longer be overridden by the server ID stored in the binary log's `format description` statement. (Bug #46640)

  References: This bug was introduced by Bug #32407.

- **Replication**: When a session was closed on the master, temporary tables belonging to that session were logged with the wrong database names when either of the following conditions was true:

  1. The length of the name of the database to which the temporary table belonged was greater than the length of the current database name.

  2. The current database was not set.

  (Bug #48216)

  References: See also Bug #46861, Bug #48297.

- **Replication**: When using statement-based or mixed-format replication, the database name was not written to the binary log when executing a `LOAD DATA INFILE` statement. This caused problems when the table being loaded belonged to a database other than the current database; data could be loaded into the wrong table (if a table having the same name existed in the current database) or replication could fail (if no table having that name existed in the current database). Now a table referenced in a `LOAD DATA INFILE` statement is always logged using its fully qualified name when the database to which it belongs is not the current database. (Bug #48297)

- **Replication**: When `mysqlbinlog --verbose` was used to read a binary log that had been written using row-based format, the output for events that updated some but not all columns of tables was not correct. (Bug #47323)

- **Replication**: When using row-based replication, `DROP TEMPORARY TABLE IF EXISTS` was written to the binary log if the table named in the statement did not exist, even though a `DROP TEMPORARY TABLE` statement should never be logged in row-based logging mode, whether the table exists or not. (Bug #46572)

- **Replication**: When using row-based replication, changes to nontransactional tables that occurred early in a transaction were not immediately flushed upon committing a statement. This behavior could break consistency since changes made to nontransactional tables become immediately visible to other connections. (Bug #47678)

  References: See also Bug #47287, Bug #46864, Bug #43929, Bug #11752675, Bug #46129. This bug is a regression of Bug #40116.

- **Replication**: Performing `ALTER TABLE ... DISABLE KEYS` on a slave table caused row-based replication to fail. (Bug #47312)

- **Replication**: `BEGIN` statements were not included in the output of `mysqlbinlog`. (Bug #46998)

- **Replication**: The internal function `get_master_version_and_clock()` (defined in `sql/slave.cc`) ignored errors and passed directly when queries failed, or when queries succeeded but the result retrieved was empty. Now this function tries to reconnect the master if a query fails due to transient network problems, and to fail otherwise. The I/O thread now prints a warning if the same system variables do not exist on master (in the event the master is a very old version of MySQL, compared to the slave.) (Bug #45214)

- **Replication**: When using statement-based replication and the transaction isolation level was set to `READ COMMITTED` or a less strict level, `InnoDB` returned an error even if the statement in question was filtered out according to the `--binlog-do-db` or `--binlog-ignore-db` rules in effect at the time. (Bug #42829)

- **Replication**: By default, all statements executed by the `mysql_upgrade` program on the master are written to the binary log, then replicated to the slave. In some cases, this can result in problems; for example, it attempted to alter log tables on replicated databases (this failed due to logging being enabled).

  As part of this fix, a `mysql_upgrade` option, `--write-binlog`, is added. Its inverse, `--skip-write-binlog`, can be used to disable binary logging while the upgrade is in progress. (Bug #43579)

- **Replication**: On the master, if a binary log event is larger than `max_allowed_packet`, the error message `ER_MASTER_FATAL_ERROR_READING_BINLOG` is sent to a slave when it requests a dump from the master, thus leading the I/O thread to stop. On a slave, the I/O thread stops when receiving a packet larger than `max_allowed_packet`.

  In both cases, however, there was no `Last_IO_Error` reported, which made it difficult to determine why the slave had stopped in such cases. Now, `Last_IO_Error` is reported when `max_allowed_packet` is exceeded, and provides the reason for which the slave I/O thread stopped. (Bug #42914)

  References: See also Bug #14068, Bug #47200, Bug #47303.

- **Replication**: When the logging format was set without binary logging being enabled, the server failed to start. Now in such cases, the server starts successfully, `binlog_format` is set, and a warning is logged instead of an error. (Bug #42928)

- **Replication**: When using row-based format, replication failed with the error `Could not execute Write_rows event on table ...; Field '...' doesn't have a default value` when an `INSERT` was made on the master without specifying a value for a column having no default, even if strict server SQL mode was not in use and the statement would otherwise have succeeded on the master. Now the SQL mode is checked, and the statement is replicated unless strict mode is in effect. For more information, see Section 5.1.6, “Server SQL Modes”. (Bug #38173)

  References: See also Bug #38262, Bug #43992.

- **Replication**: Replicating `TEXT` or `VARCHAR` columns declared as `NULL` on the master but `NOT NULL` on the slave caused the slave to crash. (Bug #43789)

  References: See also Bug #38850, Bug #43783, Bug #43785, Bug #47741, Bug #48091.

- **Replication**: Two issues encountered on replication slaves during startup were fixed:

  1. A failure while allocating the master info structure caused the slave to crash.

  2. A failure during recovery caused the relay log file not to be properly initialized which led to a crash on the slave.

  (Bug #43075)

- **Replication**: When `autocommit` was set equal to `1` after starting a transaction, the binary log did not commit the outstanding transaction. This happened because the binary log commit function saw only the values of the new settings, and decided that there was nothing to commit.

  This issue was first observed when using the `Falcon` storage engine, but it is possible that it affected other storage engines as well. (Bug #37221)

- **Replication**: `FLUSH LOGS` did not close and reopen the binary log index file. (Bug #34582)

  References: See also Bug #48738.

- **Replication**: An error message relating to permissions required for `SHOW SLAVE STATUS` was confusing. (Bug #34227)

- **Replication**: The value of `Slave_IO_running` in the output of `SHOW SLAVE STATUS` did not distinguish between all 3 possible states of the slave I/O thread (not running; running but not connected; connected). Now the value `Connecting` (rather than `No`) is shown when the slave I/O thread is running but the slave is not connected to a replication master.

  The server system variable `Slave_running` also reflects this change, and is now consistent with what is shown for `Slave_IO_running`. (Bug #30703, Bug #41613, Bug #51089)

- **Replication**: The `--base64-output` option for `mysqlbinlog` was not honored for all types of events. This interfered in some cases with performing point-in-time recovery. (Bug #32407)

  References: See also Bug #46640, Bug #34777.

- **Replication**: Queries written to the slow query log on the master were not written to the slow query log on the slave. (Bug #23300)

  References: See also Bug #48632.

- **Replication**: Valgrind revealed an issue with `mysqld` that was corrected: memory corruption in replication slaves when switching databases. (Bug #19022)

- **API**: The fix for Bug #24507 could lead in some cases to client application failures due to a race condition. Now the server waits for the "dummy" thread to return before exiting, thus making sure that only one thread can initialize the POSIX threads library. (Bug #42850)

- If `InnoDB` reached its limit on the number of concurrent transactions (1023), it wrote a descriptive message to the error log but returned a misleading error message to the client, or an assertion failure occurred. (Bug #46672)

  References: See also Bug #18828.

- An infinite hang and 100% CPU usage occurred after a handler tried to open a merge table.

  If the command `mysqladmin shutdown` was executed during the hang, the debug server generated the following assert:

  ```
  mysqld: table.cc:407: void free_table_share(TABLE_SHARE*): Assertion `share->ref_count ==
  0' failed.
  090610 14:54:04 - mysqld got signal 6 ;
  ```

  (Bug #45781)

- When building a pluggable storage engine on Windows, the engine name could be based on the directory name where the engine was located, rather than the configured storage engine name. (Bug #47795)

- The `mysys/mf_strip.c` file, which defines the `strip_sp()` function, has been removed from the MySQL source. The function was no longer used within the main build, and the supplied function was causing symbol errors on Windows builds. (Bug #47857)

- When building storage engines on Windows it was not possible to specify additional libraries within the `CMake` file required for the build. An `${engine}_LIBS` macro has been included in the files to support these additional storage-engine specific libraries. (Bug #47797)

- When creating a new instance on Windows using `mysqld-nt` and the `--install` parameter, the value of the service would be set incorrectly, resulting in a failure to start the configured service. (Bug #46917)

- The combination of `MIN()` or `MAX()` in the select list with `WHERE` and `GROUP BY` clauses could lead to incorrect results. (Bug #45386)

- After an error such as a table-full condition, `INSERT IGNORE` could cause an assertion failure for debug builds. (Bug #46075)

- The server crashed if a shutdown occurred while a connection was idle. This happened because of a `NULL` pointer dereference while logging to the error log. (Bug #46267)

- The test suite was missing from RPM packages. (Bug #46834)

- `CREATE TABLE ... SELECT` could cause a server crash if no default database was selected. (Bug #45998)

- Truncation of `DECIMAL` values could lead to assertion failures; for example, when deducing the type of a table column from a literal `DECIMAL` value. (Bug #45261)

  References: See also Bug #48370.

- `SHOW CREATE TRIGGER` for a `MERGE` table trigger caused an assertion failure. (Bug #46614)

- A query containing a subquery in the `FROM` clause and `PROCEDURE ANALYSE()` caused a server crash. (Bug #46184)

  References: See also Bug #48293.

- A query containing a view using temporary tables and multiple tables in the `FROM` clause and `PROCEDURE ANALYSE()` caused a server crash.

  As a result of this bug fix, `PROCEDURE ANALYSE()` is legal only in a top-level `SELECT`. (Bug #48293)

  References: See also Bug #46184.

- `TRUNCATE TABLE` for a table that was opened with `HANDLER` did not close the handler and left it in an inconsistent state that could lead to a server crash. Now `TRUNCATE TABLE` for a table closes all open handlers for the table. (Bug #46456)

- The server could crash for queries with the following elements: 1. An "impossible where" in the outermost `SELECT`; 2. An aggregate in the outermost `SELECT`; 3. A correlated subquery with a `WHERE` clause that includes an outer field reference as a top-

level `WHERE` sargable predicate; (Bug #46749)

- Concurrent `INSERT INTO ... SELECT` statements for an `InnoDB` table could cause an `AUTO_INCREMENT` assertion failure. (Bug #46650)
- The `mysql_config` script contained a reference to `@innodb_system_libs@` that was not replaced with the corresponding library flags during the build process and ended up in the output of `mysql_config --libs`. (Bug #47007)
- For `InnoDB` tables, an unnecessary table rebuild for `ALTER TABLE` could sometimes occur for metadata-only changes. (Bug #46760)
- `DIV` operations that are out of range generated an error `Error (Code 1264): Out of range value` (correct), but also an error: `Error (Code 1041): Out of memory` (incorrect). (Bug #46606)
- An assertion could be raised for `CREATE TABLE` if there was a pending `INSERT DELAYED` or `REPLACE DELAYED` for the same table. (Bug #47274)
- Queries of the form `SELECT SUM(DISTINCT varchar_key) FROM tbl_name` caused a server crash. (Bug #47421)
- Client flags were incorrectly initialized for the embedded server, causing several tests in the `jp` test suite to fail. (Bug #45159)
- Failed multiple-table `DELETE` statements could raise an assertion. (Bug #46958)
- The `socket` system variable was unavailable on Windows. (Bug #45498)
- `EXPLAIN` caused a server crash for certain valid queries. (Bug #47106)
- The `configure` option `--without-server` did not work. (Bug #46980)
- Solaris binary packages now are compiled with `-g0` rather than `-g`. (Bug #47137)
- The `pthread_cond_wait()` implementations for Windows could deadlock in some rare circumstances. (Bug #47768)
- Appending values to an `ENUM` or `SET` definition is a metadata change for which `ALTER TABLE` need not rebuild the table, but it was being rebuilt anyway. (Bug #45567)
- Debug builds could not be compiled with the Sun Studio compiler. (Bug #47474)
- On Mac OS X or Windows, sending a `SIGHUP` signal to the server or an asynchronous flush (triggered by `flush_time`) caused the server to crash. (Bug #47525)
- A multiple-table `UPDATE` involving a natural join and a mergeable view raised an assertion. (Bug #47150)
- `InnoDB` did not disallow creation of an index with the name `GEN_CLUST_INDEX`, which is used internally. (Bug #46000)
- Dropping an `InnoDB` table that used an unknown collation (created on a different server, for example) caused a server crash. (Bug #46256)
- Incorrect handling of predicates involving `NULL` by the range optimizer could lead to an infinite loop during query execution. (Bug #47123)
- A simple `SELECT` with implicit grouping could return many rows rather than a single row if the query was ordered by the aggregated column in the select list. (Bug #47280)
- During the build of the Red Hat IA64 MySQL server RPM, the system library link order was incorrect. This made the resulting Red Hat IA64 RPM depend on "libc.so.6.1(GLIBC_PRIVATE)(64bit)", thus preventing installation of the package. (Bug #45706)
- A build configured using the `--without-server` option did not compile the yaSSL code, so if `--with-ssl` was also used, the build failed. (Bug #47957)
- `mysys/mf_keycache.c` requires threading, but no test was made for thread support. (Bug #47923)
- The GPL and commercial license headers had different sizes, so that error log, backtrace, core dump, and cluster trace file line numbers could be off by one if they were not checked against the version of the source used for the build. (For example, checking a GPL build backtrace against commercial sources.) (Bug #46216)
- Repair by sort or parallel repair of `MyISAM` tables might not fail over to repair with key cache. (Bug #47073)
- Trailing spaces were not ignored for user-defined collations that mapped spaces to a character other than 0x20. (Bug #46448)

  References: See also Bug #29468.

- Server shutdown failed on Windows. (Bug #48047)
- Concurrent execution of statements requiring a table-level lock and statements requiring a non-table-level write lock for a table could deadlock. (Bug #45143)
- On Windows, when an idle named pipe connection was forcibly closed with a `KILL` statement or because the server was being shut down, the thread that was closing the connection would hang infinitely.

  As a result of the work done for this bug, the `net_read_timeout`, `net_write_timeout`, and `wait_timeout`, system variables now apply to connections over all transports, not just to TCP/IP. (Bug #47571, Bug #31621)
- A function call could end without throwing an error or setting the return value. For example, this could happen when an error occurred while calculating the return value. This is fixed by setting the value to `NULL` when an error occurs during evaluation of an expression. (Bug #47412)
- If a transaction was rolled back inside `InnoDB` due to a deadlock or lock wait timeout, and a statement in the transaction had an `IGNORE` clause, the server could crash at the end of the statement or on shutdown. (Bug #46539)
- During cleanup of a stored procedure's internal structures, the flag to ignore the errors for `INSERT IGNORE` or `UPDATE IGNORE` was not cleaned up, which could result in a server crash. (Bug #47788)
- Error handling was missing for `SELECT` statements containing subqueries in the `WHERE` clause and that assigned a `SELECT` result to a user variable. The server could crash as a result. (Bug #48291)
- `InnoDB` could crash when updating spatial values. (Bug #47777)
- If the first argument to `GeomFromWKB()` function was a geometry value, the function just returned its value. However, it failed to preserve the argument's `null_value` flag, which caused an unexpected `NULL` value to be returned to the caller, resulting in a server crash. (Bug #47780)
- An assertion could fail if the optimizer used a `SPATIAL` index. (Bug #48258, Bug #47019)
- For debug builds, an assertion could fail during the next statement executed for a temporary table after a multiple-table `UPDATE` involving that table modified an `AUTO_INCREMENT` column with a user-supplied value. (Bug #47919)
- The Serbian locale name `'sr_YU'` is obsolete. It is still recognized for backward compatibility, but `'sr_RS'` now should be used instead. (Bug #46633)
- The `caseinfo` member of the `CHARSET_INFO` structure was not initialized for user-defined Unicode collations, leading to a server crash. (Bug #45645)
- On Solaris and HP-UX systems with the environment set to the default `C` locale, MySQL client programs issued an `Unknown OS character set` error. (Bug #46619)
- On Windows, when a failed I/O operation occurred with return code of `ERROR_WORKING_SET_QUOTA`, `InnoDB` intentionally crashed the server. Now `InnoDB` sleeps for 100ms and retries the failed operation. (Bug #47055)
- Following a literal, the `COLLATE` clause was mishandled such that different results could be produced depending on whether an index was used. (Bug #48447)
- A combination of `GROUP BY WITH ROLLUP`, `DISTINCT` and the `const` join type in a query caused a server crash when the optimizer used a temporary table to resolve `DISTINCT`. (Bug #48131)
- Searches using a nondefault collation could return different results for a table depending on whether partitioning was used. (Bug #48161)
- The encoding of values for `SET` *`system_variable = identifier`* statements was incorrect, resulting in incorrect error messages. (Bug #47597)
- When MySQL crashed (or a snapshot was taken that simulates a crash), it was possible that internal XA transactions (used to synchronize the binary log and `InnoDB`) could be left in a `PREPARED` state, whereas they should be rolled back. This occurred when the `server_id` value changed before the restart, because that value was used to construct XID values.

  Now the restriction is relaxed that the `server_id` value be consistent for XID values to be considered valid. The rollback phase should then be able to clean up all pending XA transactions. (Bug #46944)
- On FreeBSD, memory mapping for `MERGE` tables could fail if underlying tables were empty. (Bug #47139)
- In some cases, using a null microsecond part in a `WHERE` condition (for example, `WHERE date_time_field <= 'YYYY-MM-DD HH:MM:SS.0000'`) could lead to incorrect results due to improper `DATETIME` comparison. (Bug #47963)

- The subquery optimizer had a memory leak. (Bug #48060)
- Configuring MySQL for DTrace support resulted in a build failure on Solaris if the directory for the `dtrace` executable was not in `PATH`. (Bug #45810)
- `SUM()` artificially increased the precision of a `DECIMAL` argument, which was truncated when a temporary table was created to hold the results. (Bug #48370)

  References: See also Bug #45261.
- `InnoDB` mishandled memory-allocation failures in the `os_mem_alloc_large()` function. (Bug #48237)
- `WHERE` clauses with *`outer_value_list NOT IN subquery`* were handled incorrectly if the outer value list contained multiple items at least one of which could be `NULL`. (Bug #48177)
- If an outer query was invalid, a subquery might not be set up. `EXPLAIN EXTENDED` did not expect this and caused a crash by trying to dereference improperly set up information. (Bug #48295)
- When a query used a `DATE` or `DATETIME` value formatted using any separator characters other than hyphen (`'-'`) and a `>=` condition matching only the greatest value in an indexed column, the result was empty if an index range scan was employed. (Bug #47925)
- If an `InnoDB` table was created with the `AUTO_INCREMENT` table option to specify an initial auto-increment value, and an index was added in a separate operation later, the auto-increment value was lost (subsequent inserts began at 1 rather than the specified value). (Bug #47125)
- `InnoDB` did not compile on some Solaris systems. (Bug #47058)
- `InnoDB` did not compile using `gcc` 4.1 on PowerPC systems. (Bug #46718)
- `InnoDB` raised errors in some cases in a manner not compatible with `SIGNAL` and `RESIGNAL`. (Bug #47233)
- `InnoDB` now ignores negative values supplied by a user for an `AUTO_INCREMENT` column when calculating the next value to store in the data dictionary. Setting `AUTO_INCREMENT` columns to negative values is undefined behavior and this change should bring the behavior of `InnoDB` closer to what users expect. (Bug #46965)
- A Valgrind error during index creation by `InnoDB` was corrected. (Bug #46657)
- On 64-bit systems, `--skip-innodb` did not skip `InnoDB` startup. (Bug #46043)
- `mysqladmin debug` could crash on 64-bit systems. (Bug #47382)
- Certain `INTERVAL` expressions could cause a crash on 64-bit systems. (Bug #48739)
- `GRANT` and `REVOKE` crashed if a user name was specified as `CURRENT_USER()`. (Bug #48319)
- The `mysql-stress-test.pl` test script was missing from the `noinstall` packages on Windows. (Bug #41546)
- If the server was started with an option that had a missing or invalid value, a subsequent error that normally would cause the server to shut down could cause it to crash instead. (Bug #42244)
- A Valgrind warning in `open_tables()` was corrected. (Bug #41759)
- `INFORMATION_SCHEMA` access optimizations did not work properly in some cases. (Bug #39270)
- When a storage engine plugin failed to initialize before allocating a slot number, it would acidentally unplug the engine installed in slot 0. (Bug #41013)
- The `mysql_stmt_close()` C API function did not flush all pending data associated with the prepared statement. (Bug #39519)
- A workload consisting of `CREATE TABLE ... SELECT` and DML operations could cause deadlock. (Bug #37433)
- Optimized builds of `mysqld` crashed when built with Sun Studio on SPARC platforms. (Bug #40244)
- The `ALTER ROUTINE` privilege incorrectly permitted `SHOW CREATE TABLE`. (Bug #38347)
- `mysqlbinlog` option-processing code had a memory leak. (Bug #38468)
- For settings of `lower_case_table_names` greater than 0, some queries for `INFORMATION_SCHEMA` tables left entries with incorrect lettercase in the table definition cache. (Bug #44738)

- Setting the `general_log_file` or `slow_query_log_file` system variable to a nonconstant expression caused the variable to become unset. (Bug #38124)
- `DROP DATABASE` did not clear the message list. (Bug #43012, Bug #43138)
- Previously, `InnoDB` performed `REPLACE INTO T SELECT ... FROM S WHERE ...` by setting shared next-key locks on rows from `S`. Now `InnoDB` selects rows from `S` with shared locks or as a consistent read, as for `INSERT ... SELECT`. This reduces lock contention between sessions. (Bug #37232)
- `mysqld_safe` could fail to find the `logger` program. (Bug #44736)
- Redefining a trigger could cause an assertion failure. (Bug #43054)
- `ALTER TABLE` neglected to preserve `ROW_FORMAT` information from the original table, which could cause subsequent `ALTER TABLE` and `OPTIMIZE TABLE` statements to lose the row format for `InnoDB` tables. (Bug #39200)
- `CREATE TABLE` failed if a column name in a `FOREIGN KEY` clause was given in a lettercase different from the corresponding index definition. (Bug #39932)
- For debug builds, executing a stored procedure as a prepared statement could sometimes cause an assertion failure. (Bug #44521)
- Using `mysql_stmt_execute()` to call a stored procedure could cause a server crash. (Bug #44495)
- Some Perl scripts in AIX packages contained an incorrect path to the `perl` executable. (Bug #44643)
- `SHOW ERRORS` returned an empty result set after an attempt to drop a nonexistent table. (Bug #42364)
- Attempts to enable `large_pages` with a shared memory segment larger than 4GB caused a server crash. (Bug #43606)
- Selecting from the process list in the embedded server caused a crash. (Bug #43733)

  References: See also Bug #47304.
- `LOAD DATA INFILE` statements were written to the binary log in such a way that parsing problems could occur when re-executing the statement from the log. (Bug #43746)
- `SELECT ... WHERE ... IN (NULL, ...)` was executed using a full table scan, even if the same query without the `NULL` used an efficient range scan. (Bug #44139)

  References: See also Bug #18360.
- The MySQL client library mishandled `EINPROGRESS` errors for connections in nonblocking mode. This could lead to replication failures on hosts capable of resolving both IPv4 and IPv6 network addresses, when trying to resolve `localhost`. (Bug #37267)

  References: See also Bug #44344.
- `InnoDB` did not always disallow creating tables containing columns with names that match the names of internal columns, such as `DB_ROW_ID`, `DB_TRX_ID`, `DB_ROLL_PTR`, and `DB_MIX_ID`. (Bug #44369)
- The server used the wrong lock type (always `TL_READ` instead of `TL_READ_NO_INSERT` when appropriate) for tables used in subqueries of `UPDATE` statements. This led in some cases to replication failure because statements were written in the wrong order to the binary log. (Bug #42108)
- `InnoDB` use of `SELECT MAX(autoinc_column)` could cause a crash when MySQL data dictionaries went out of sync. (Bug #44030)
- The `NUM_FLAG` bit of the `MYSQL_FIELD.flags` member now is set for columns of type `MYSQL_TYPE_NEWDECIMAL`. (Bug #42980)
- Failure to treat `BIT` values as unsigned could lead to unpredictable results. (Bug #42803)
- Incorrect handling of range predicates combined with `OR` operators could yield incorrect results. (Bug #42846)
- The `FORCE INDEX FOR ORDER BY` index hint was ignored when join buffering was used. (Bug #43029)
- With `InnoDB`, renaming a table column and then creating an index on the renamed column caused a server crash to the `.frm` file and the `InnoDB` data directory going out of sync. Now `InnoDB` 1.0.5 returns an error instead: `ERROR 1034 (HY000): Incorrect key file for table 'tbl_name'; try to repair it`. To work around the problem, create another table with the same structure and copy the original table to it. (Bug #44571)

- An InnoDB error message incorrectly referred to the nonexistent innodb_max_files_open variable rather than to innodb_open_files. (Bug #44338)
- For certain SELECT statements using ref access, MySQL estimated an incorrect number of rows, which could lead to inefficient query plans. (Bug #38049)
- The weekday names for the Romanian lc_time_names locale 'ro_RO' were incorrect. Thanks to Andrei Boros for the patch to fix this bug. (Bug #43207)
- For ALTER TABLE, renaming a DATETIME or TIMESTAMP column unnecessarily caused a table copy operation. (Bug #43508)
- For the embedded server on Windows, InnoDB crashed when innodb_file_per_table was enabled and a table name was in full path format. (Bug #42383)
- Simultaneous ANALYZE TABLE operations for an InnoDB tables could be subject to a race condition. (Bug #38996)
- With a nonstandard InnoDB page size, some error messages became inaccurate.

  > **Note**
  >
  > Changing the page size is not a supported operation and there is no guarantee that InnoDB will function normally with a page size other than 16KB. Problems compiling or running InnoDB may occur. In particular, ROW_FORMAT=COMPRESSED in InnoDB assumes that the page size is at most 16KB and uses 14-bit pointers.
  >
  > A version of InnoDB built for one page size cannot use data files or log files from a version built for a different page size.

  (Bug #41490)
- In a replication scenario with innodb_locks_unsafe_for_binlog enabled on the slave, where rows were changed only on the slave (not through replication), in some rare cases, many messages of the following form were written to the slave error log: InnoDB: Error: unlock row could not find a 4 mode lock on the record. (Bug #41756)
- XA START could cause an assertion failure or server crash when it is called after a unilateral rollback issued by the Resource Manager (both in a regular transaction and after an XA transaction). (Bug #43171)
- Some queries with nested outer joins could lead to crashes or incorrect results because an internal data structure was handled improperly. (Bug #42116)
- After renaming a user, granting that user privileges could result in the user having privileges additional to those granted. (Bug #41597)
- In some cases, the server did not recognize lettercase differences between GRANT attributes such as table name or user name. For example, a user was able to perform operations on a table with privileges of another user with the same user name but in a different lettercase.

  In consequence of this bug fix, the collation for the Routine_name column of the mysql.proc table is changed from utf8_bin to utf8_general_ci. (Bug #41049)

  References: See also Bug #48872.
- There was a race condition between the event scheduler and the server shutdown thread. (Bug #32771)
- Concurrent execution of FLUSH TABLES along with SHOW FUNCTION STATUS or SHOW PROCEDURE STATUS could cause a server crash. (Bug #34895)
- Different invocations of CHECKSUM TABLE could return different results for a table containing columns with spatial data types. (Bug #35570)
- The SHOW FUNCTION CODE and SHOW PROCEDURE CODE statements are not present in nondebug builds, but attempting to use them resulted in a “syntax error” message. Now the error message indicates that the statements are disabled and that you must use a debug build. (Bug #33637)
- Some warnings were being reported as errors. (Bug #36777)
- mysql_real_connect() did not check whether the MYSQL connection handler was already connected and connected again even if so. Now a CR_ALREADY_CONNECTED error occurs. (Bug #33831)
- There were spurious warnings about "Truncated incorrect DOUBLE value" in queries with MATCH ... AGAINST and > or < with a constant (which was reported as an incorrect DOUBLE value) in the WHERE condition. (Bug

#34374)

- `ALTER TABLE` statements that added a column and added a nonpartial index on the column failed to add the index. (Bug #31031)

- Result set metadata for columns retrieved from `INFORMATION_SCHEMA` tables did not have the `db` or `org_table` members of the `MYSQL_FIELD` structure set. (Bug #35428)

- `SHOW CREATE EVENT` output did not include the `DEFINER` clause. (Bug #35297)

- When an `InnoDB` tablespace filled up, an error was logged to the client, but not to the error log. Also, the error message was misleading and did not indicate the real source of the problem. (Bug #31183)

- `INSTALL PLUGIN` and `UNINSTALL PLUGIN` did not handle plugin identifiers consistently with respect to lettercase. (Bug #33731)

- The default values for the general query log and slow query log file are documented to be based on the server host name and located in the data directory. However, they were in fact being based on the basename and location of the process ID (PID) file. The name and location defaults for the PID file are based on the server host name and data directory, so if it was not assigned a different name explicitly, its defaults were used and the general query log and slow query log file defaults were as documented. But if the PID file was assigned a value with the `--pid-file` option, the defaults for the general query log and slow query log file were incorrect. This has been rectified so that the defaults for all three files are based on the server host name and data directory.

  A remaining problem is that the binary log and relay log `.NNNNNN` and `.index` basename defaults are based on the PID file basename, contrary to the documentation. This issue is to be addressed as Bug #45359. (Bug #33693)

- A `COMMENT` longer than 64 characters caused `CREATE PROCEDURE` to fail. (Bug #34197)

- The `LAST_DAY()` and `MAKEDATE()` functions could return `NULL`, but the result metadata indicated `NOT NULL`. Thanks to Hiromichi Watari for the patch to fix this bug. (Bug #33629)

- Instance Manager (`mysqlmanager`) has been removed, but a reference to it still appeared in the `mysql.server` script. (Bug #33472)

- For its warning count, the `mysql_info()` C API function could print the number of truncated data items rather than the number of warnings. (Bug #34898)

- Privileges for `SHOW CREATE VIEW` were not being checked correctly. (Bug #35996)

- For `const` tables that were optimized away, `EXPLAIN EXTENDED` displayed them in the `FROM` clause. Now they are not displayed. If all tables are optimized away, `FROM DUAL` is displayed. (Bug #30302)

- Executing `SHOW MASTER LOGS` as a prepared statement without binary logging enabled caused a crash for debug builds. (Bug #34741)

- When building MySQL on Windows from source, the `WITH_BERKELEY_STORAGE_ENGINE` option would fail to configure `BDB` support correctly. (Bug #27693)

- The default database is no longer changed to `NULL` (“no database”) if `DROP DATABASE` for that database failed. (Bug #26704)

- There were cases where string-to-number conversions would produce warnings for `CHAR` values but not for `VARCHAR` values. (Bug #28299)

- `DROP TABLE` for `INFORMATION_SCHEMA` tables produced an `Unknown table` error rather than the more appropriate `Access denied`. (Bug #24062)

- In `mysql`, using **Control+C** to kill the current query resulted in a `ERROR 1053 (08S01): Server shutdown in progress" message` if the query was waiting for a lock. (Bug #28141)

- `SELECT COUNT(DISTINCT)` was slow compared with `SELECT DISTINCT`. Now the server can use loose index scan for certain forms of aggregate functions that use `DISTINCT`. See Section 7.13.10.1, “Loose Index Scan”. (Bug #21849, Bug #38213)

- Referring to a stored function qualified with the name of one database and tables in another database caused a “table doesn't exist” error. (Bug #18444)

- A `TABLE ... DOESN'T EXIST` error could occur for statements that called a function defined in another database. (Bug #17199)

D.2. MySQL Connector/ODBC (MyODBC) Change History

D.2.1. Changes in MySQL Connector/ODBC Version 5.1.x

D.2.1.1. Changes in MySQL Connector/ODBC 5.1.10 (02 February 2012)

Bugs Fixed

- `SQLFetch` has to return error if indicator pointer is `NULL` for `NULL` value. (Bug #13542600)
- In some cases, a `TIMESTAMP` field could be described as `SQL_NO_NULLS`. (Bug #13532987)
- A failure on one statement causes another statement to fail. (Bug #13097201, Bug #62657)

D.2.1.2. Changes in MySQL Connector/ODBC 5.1.9 (06 October 2011)

Only the source code and Windows binaries are available with this release.

The 64-bit MSI installer no longer contains 32-bit and 64-bit builds of the driver, like it did in previous versions. It now only includes 64-bit support.

Pluggable Authentication Notes

- The binaries for this distribution of Connector/ODBC can now connect to MySQL server accounts that use the PAM or Windows Native Authentication Plugins for authentication. See Section 5.5.6.2, “The PAM Authentication Plugin”, and Section 5.5.6.3, “The Windows Native Authentication Plugin”. These capabilities result from linking the Connector/ODBC binaries against the MySQL 5.5.16 `libmysql` rather than the MySQL 5.1 `libmysql` used previously. The newer `libmysql` includes the client-side support needed for the server-side PAM and Windows authentication plugins.

Bugs Fixed

- Some catalog functions (such as `SQLColumns()`, `SQLStatistics()`, and `SQLPrimaryKeys()`) would only return one row, when called after pre-execution failed. (Bug #12824839)
- The CLI installer script `mysqlodbc-installer` was missing documentation about how to configure the optional data source parameters. (Bug #12810058)
- The `Install.bat` script contained leftover `3.51` information, and did not properly install the `5.1` Connector/ODBC connector. (Bug #12781039)
- An off-by-one error, where `sqlwcharchr` might read one `SQLWCHAR` after the end of a string. (Bug #61586)
- `SQLExecute` would return `SQL_SUCCESS_WITH_INFO` instead of `SQL_ERROR`, when column parameter binding was enabled. (Bug #59772)
- The Connector/ODBC driver did not call `mysql_thread_end()` when a thread ended, which caused error messages like: `Error in my_thread_global_end(): 1 threads didn't exit`. (Bug #57727)
- When using MySQL Connector/ODBC to fetch data, if a `net_write_timeout` condition occurred, the operation returned the standard "end of data" status, rather than an error. (Bug #39878)
- MS Access fields with `VARCHAR NOT NULL` columns could not be altered. (Bug #31067)

D.2.1.3. Changes in MySQL Connector/ODBC 5.1.8 (07 November 2010)

Functionality Added or Changed

- Documentation in `.CHM` and `.HLP` format has been removed from the distribution. (Bug #56232)

Bugs Fixed

- When used after a call to `SQLTables()`, `SQLRowCount()` did not return the correct value. (Bug #55870)
- When attempting to install the latest Connector/ODBC 5.1.6 on Windows using the MSI, with an existing 5.1.x version already installed, the following error was generated:

```
Another version of this product is already installed.  Installation of this version
cannot continue.  To configure or remove the existing version of this product, use
Add/Remove Programs on the Control Panel.
```

  Also, the version number displayed in the ODBC Data Source Administrator/Drivers tab did not get updated when removing or installing a new version of 5.1.x. (Bug #54314)
- For some procedure and parameter combinations `SQLProcedureColumns()` did not work correctly. For example, it could not return records for an existing procedure with correct parameters supplied.

  Further, it returned incorrect data for column 7, `TYPE_NAME`. For example, it returned `VARCHAR(20)` instead of `VARCHAR`. (Bug #57182)
- After installing MySQL Connector/ODBC, the system DSN created could not be configured or deleted. An error dialog was displayed, showing the error message “Invalid attribute string”.

  In this case the problem was due to the fact that the driver could not parse the NULL-separated connection string. (Bug #56233)
- The MySQL Connector/ODBC MSI installer did not set the `InstallLocation` value in the Microsoft Windows registry. (Bug #56978)
- In bulk upload mode, `SQLExecute` would return `SQL_SUCCESS`, even when the uploaded data contained errors, such as primary key duplication, and foreign key violation. (Bug #56804)
- `SQLDescribeCol` and `SQLColAttribute` could not be called before `SQLExecute`, if the query was parameterized and not all parameters were bound.

  Note, MSDN states that “For performance reasons, an application should not call `SQLColAttribute/SQLDescribeCol` before executing a statement.” However, it should still be possible to do so if performance reasons are not paramount. (Bug #56717)
- When `SQLNumResultCols()` was called between `SQLPrepare()` and `SQLExecute()` the driver ran `SET @@sql_select_limit=1`, which limited the resultset to just one row. (Bug #56677)

D.2.1.4. Changes in MySQL Connector/ODBC 5.1.7 (24 August 2010)

Functionality Added or Changed

- MySQL Connector/ODBC has been changed to support the `CLIENT_INTERACTIVE` flag. (Bug #48603)

Bugs Fixed

- `SQLColAttribute(SQL_DESC_PRECISION...)` function returned incorrect results for type identifiers that have a negative value:

```
#define SQL_LONGVARCHAR       (-1) returned 4294967295
#define SQL_BINARY            (-2) returned 4294967294
#define SQL_VARBINARY         (-3) returned 4294967293
#define SQL_LONGVARBINARY     (-4) returned 4294967292
#define SQL_BIGINT            (-5) returned 4294967291
#define SQL_TINYINT           (-6) returned 4294967290
#define SQL_BIT               (-7) returned 4294967289
```

  They were returned as 32-bit unsigned integer values. This only happened on 64-bit Linux. (Bug #55024)
- `SQLColAttribute` for `SQL_DESC_OCTET_LENGTH` returned length including terminating null byte. It should not have included the null byte. (Bug #54206)
- When executing the `SQLProcedureColumns()` ODBC function, the driver reported the following error:

```
MySQL server does not provide the requested information
```

  (Bug #50400)

- In contrast to all other ODBC catalog functions `SQLTablePrivileges` required the user to have `SELECT` privilege on MySQL schemata, otherwise the function returned with an error:

```
SQL Error. Native Code: 1142, SQLState: HY000, Return Code: -1
[MySQL][ODBC 5.1 Driver][mysqld-5.0.67-community-nt]SELECT command denied to user
'repadmin'@'localhost' for table 'tables_priv'
[Error][SQL Error]Error executing SQLTablePrivileges for object cat: myrep, object Name:
xxxxxxxxxx
```

  (Bug #50195)

- `SQLForeignKeys()` did not return the correct information. The list of foreign keys in other tables should not have included foreign keys that point to unique constraints in the specified table. (Bug #51422)

- Retrieval of the current catalog at the moment when a connection was not ready, such as when the connection had been broken or when not all pending results had been processed, resulted in the application crashing. (Bug #46910)

- If an application was invoked by the root user, `SQLDriverConnect()` was not able to use the username and password in the connection string to connect to the database. (Bug #45378)

- The `SQLColumns` function returned the incorrect transfer octet length into the column `BUFFER_LENGTH` for `DECIMAL` type. (Bug #53235)

- Describing a view or table caused `SQLPrepare` to prefetch table data. For large tables this created an intolerable performance hit. (Bug #46411)

- Bulk upload operations did not work for queries that used parameters. (Bug #48310)

- MySQL Connector/ODBC manually added a `LIMIT` clause to the end of certain SQL statements, causing errors for statements that contained code that should be positioned after the `LIMIT` clause. (Bug #49726)

- If `NO_BACKSLASH_ESCAPES` mode was used on a server, escaping binary data led to server query parsing errors. (Bug #49029)

- Executing `SQLForeignKeys` to get imported foreign keys for tables took an excessively long time. For example, getting imported foreign keys for 252 tables to determine parent/child dependencies took about 3 minutes and 14 seconds for the 5.1.5 driver, whereas it took 3 seconds for the 3.5x.x driver. (Bug #39562)

- The `SQLTables()` function required approximately two to four minutes to return the list of 400 tables in a database. The `SHOW TABLE STATUS` query used by `SQLTables()` was extremely slow for InnoDB tables with a large number of rows because the query was calculating the approximate number of rows in each table. Further, the results could not be cached due to non-deterministic nature of the result set (the row count was re-calculated every time), impacting performance further. (Bug #43664)

- `SQLDescribeCol` returned incorrect column definitions for `SQLTables` result. (Bug #37621)

- Calling `SQLColAttribute` on a date column did not set `SQL_DESC_DATETIME_INTERVAL_CODE`. `SQLColAttribute` returned `SQL_SUCCESS` but the integer passed in was not set to `SQL_CODE_DATE`. (Bug #44576)

- Conversions for many types were missing from the file `driver/info.c`. (Bug #43855)

- When opening `ADO.Recordset` from Microsoft Access 2003, a run-time error occurred:

```
ErrNo: -2147467259 ErrMessage: Data provider or other service returned an E_FAIL status.
```

  (Bug #36996)

- On Windows, the SOCKET parameter to the DSN was used as the named pipe name to connect to. This was not exposed in the Windows setup GUI. (Bug #34477)

- Option for handling bad dates was not available in the GUI. (Bug #30539)

- `SQLPrimaryKeysW` returned mangled strings for table name, column name and primary key name. (Bug #36441)

- MySQL Connector/ODBC returned a value of zero for a column with a non-zero value. This happened when the column had a data type of `BIT`, and any numeric type was used in `SQLBindCol`. (Bug #32821)

D.2.1.5. Changes in MySQL Connector/ODBC 5.1.6 (09 November 2009)

Functionality Added or Changed

- In the MySQL Data Source Configuration dialog, an excessive number of tabs were required to navigate to selection of a database. MySQL Connector/ODBC has been changed to make the tab order more practical, thereby enabling faster configuration of a Data Source. (Bug #42905)

Bugs Fixed

- MySQL Connector/ODBC overwrote the query log. MySQL Connector/ODBC was changed to append the log, rather than overwrite it. (Bug #44965)
- Inserting a new record using `SQLSetPos` did not correspond to the database name specified in the `SELECT` statement when querying tables from databases other than the current one.

  `SQLSetPos` attempted to do the `INSERT` in the current database, but finished with a `SQL_ERROR` result and "Table does not exist" message from MySQL Server. (Bug #41946)
- Binding `SQL_C_BIT` to an `INTEGER` column did not work.

  The `sql_get_data()` function only worked correctly for `BOOLEAN` columns that corresponded to `SQL_C_BIT` buffers. (Bug #39644)
- In Access 97, when linking a table containing a `LONGTEXT` or `TEXT` field to a MySQL Connector/ODBC DSN, the fields were shown as `TEXT(255)` in the table structure. Data was therefore truncated to 255 characters. (Bug #40932)
- An error randomly occurred on Windows 2003 Servers (German language Version) serving classic ASP scripts on IIS6 MDAC version 2.8 SP2 on Windows 2003 SP2. The application connected to MySQL Server 5.0.44-log with a charset of UTF-8 Unicode (utf8). The MySQL server was running on Gentoo Linux.

  The script error occurred sporadically on the following line of code:

  ```
  SET my_conn = Server.CreateObject("ADODB.Connection")
  my_conn.Open ConnString  <- ERROR
  ```

  The connection was either a DSN or the explicit connection string:

  ```
  Driver={MySQL ODBC 5.1 Driver};SERVER=abc.abc.abc.abc;DATABASE=dbname;UID=uidname;PWD=pwdname;PORT=3306;OPTION=6710
  ```

  The error occurred on connections established using either a DNS or a connection string.

  When IISState and Debug Diagnostic Tool 1.0.0.152 was used to analyse the code, the following crash analysis was generated:

  ```
  MYODBC5!UTF16TOUTF32+6In 4640-1242788336.dmp the assembly instruction at
  myodbc5!utf16toutf32+6 in C:\Programme\MySQL\Connector ODBC 5.1\myodbc5.dll from MySQL AB
  has caused an access violation exception (0xC0000005) when trying to read from memory
  location 0x194dd000 on thread 33
  ```

  (Bug #44971)
- When a column of type `DECIMAL` containing `NULL` was accessed, MySQL Connector/ODBC returned a 0 rather than a `NULL`. (Bug #41081)
- MySQL Connector/ODBC updated some fields with random values, rather than with `NULL`. (Bug #41256)
- Calling `SQLDescribeCol()` with a NULL buffer and nonzero buffer length caused a crash. (Bug #41942)
- MySQL Connector/ODBC failed to build with MySQL 5.1.30 due to incorrect use of the data type `bool`. (Bug #42120)
- The connection string option `Enable Auto-reconnect` did not work. When the connection failed, it could not be restored, and the errors generated were the same as if the option had not been selected. (Bug #37179)
- Connector/ODBC would crash when a character set was being used on the server that was not supported in the client, for example cp1251:

  ```
  [MySQL][ODBC 5.1 Driver][mysqld-5.0.27-community-nt]Restricted data type attribute violation
  ```

  The fix causes Connector/ODBC to return an error message instead of crashing. (Bug #39831)
- Connector/ODBC 5.1.5 was not able to connect if the connection string parameters contained spaces or tab symbols. For example, if the `SERVER` parameter was specified as "SERVER= localhost" instead of "SERVER=localhost" the following error message will be displayed:

```
[MySQL][ODBC 5.1 Driver] Unknown MySQL server host ' localhost' (11001).
```

(Bug #39085)

- Setting the ADO `Recordset` decimal field value to 44.56 resulted in an incorrect value of 445600.0000 being stored when the record set was updated with the `Update` method. (Bug #39961)
- The `SQLTablesW` API gave incorrect results. For example, table name and table type were returned as `NULL` rather than as the correct values. (Bug #39957)
- Calling `SQLDriverConnect()` with a `NULL` pointer for the output buffer caused a crash if `SQL_DRIVER_NOPROMPT` was also specified:

```
SQLDriverConnect(dbc, NULL, "DSN=myodbc5", SQL_NTS, NULL, 0, NULL, SQL_DRIVER_NOPROMPT)
```

(Bug #40316)

- Data-at-execution parameters were not supported during positioned update. This meant updating a long text field with a cursor update would erroneously set the value to null. This would lead to the error `Column 'column_name' cannot be null` while updating the database, even when `column_name` had been assigned a valid nonnull string. (Bug #37649)
- The pointer passed to the `SQLDriverConnect` method to retrieve the output connection string length was one greater than it should have been due to the inclusion of the NULL terminator. (Bug #38949)
- The `SQLDriverConnect` method truncated the `OutputConnectionString` parameter to 52 characters. (Bug #37278)
- The `SQLGetInfo()` function returned 0 for `SQL_CATALOG_USAGE` information. (Bug #39560)
- When the `SQLTables` method was called with `NULL` passed as the `tablename` parameter, only one row in the `resultset`, with table name of `NULL` was returned, instead of all tables for the given database. (Bug #39561)
- Insertion of data into a `LONGTEXT` table field did not work. If such an attempt was made the corresponding field would be found to be empty on examination, or contain random characters. (Bug #36071)
- No result record was returned for `SQLGetTypeInfo` for the `TIMESTAMP` data type. An application would receive the result `return code 100 (SQL_NO_DATA_FOUND)`. (Bug #30626)
- It was not possible to use MySQL Connector/ODBC to connect to a server using SSL. The following error was generated:

```
Runtime error '-2147467259 (80004005)':

[MySQL][ODBC 3.51 Driver]SSL connection error.
```

(Bug #29955)

- When the `recordSet.Update` function was called to update an `adLongVarChar` field, the field was updated but the recordset was immediately lost. This happened with driver cursors, whether the cursor was opened in optimistic or pessimistic mode.

  When the next update was called the test code would exit with the following error:

```
-2147467259 : Query-based update failed because the row to update could not be found.
```

(Bug #26950)

- Microsoft Access was not able to read `BIGINT` values properly from a table with just two columns of type `BIGINT` and `VARCHAR`. `#DELETE` appeared instead of the correct values. (Bug #17679)

D.2.1.6. Changes in MySQL Connector/ODBC 5.1.5 (18 August 2008)

Bugs Fixed

- The connector failed to prompt for additional information required to create a DSN-less connection from an application such as Microsoft Excel. (Bug #37254)
- ODBC `TIMESTAMP` string format is not handled properly by Connector/ODBC. When passing a `TIMESTAMP` or `DATE` to Connector/ODBC, in the ODBC format: {d <date>} or {ts <timestamp>}, the string that represents this is copied once into the

SQL statement, and then added again, as an escaped string. (Bug #37342)

- Assigning a string longer than 67 characters to the `TableType` parameter resulted in a buffer overrun when the `SQLTables()` function was called. (Bug #36275)
- After having successfully established a connection, a crash occurs when calling `SQLProcedures()` followed by `SQLFreeStmt()`, using the ODBC C API. (Bug #36069)
- `SQLDriverConnect` does not return `SQL_NO_DATA` on cancel. The ODBC documentation specifies that this method should return `SQL_NO_DATA` when the user cancels the dialog to connect. The connector, however, returns `SQL_ERROR`. (Bug #36293)
- The ODBC connector randomly uses logon information stored in `odbc-profile`, or prompts the user for connection information and ignores any settings stored in `odbc-profile`. (Bug #36203)

D.2.1.7. Changes in MySQL Connector/ODBC 5.1.4 (15 April 2008)

Bugs Fixed

- Wrong result obtained when using `sum()` on a `decimal(8,2)` field type. (Bug #35920)
- The driver crashes ODBC Administrator on attempting to add a new DSN. (Bug #32057)
- The driver installer could not create a new DSN if many other drivers were already installed. (Bug #35776)
- On Linux, `SQLGetDiagRec()` returned `SQL_SUCCESS` in cases when it should have returned `SQL_NO_DATA`. (Bug #33910)
- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE (SQL_COLUMN_MONEY)` attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. (Bug #35581)

D.2.1.8. Changes in MySQL Connector/ODBC 5.1.3 (26 March 2008)

Platform-Specific Notes

- **Important Change**: You must uninstall previous 5.1.x editions of MySQL Connector/ODBC before installing the new version.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

Bugs Fixed

- **Important Change**: In previous versions, the SSL certificate would automatically be verified when used as part of the MySQL Connector/ODBC connection. The default mode is now to ignore the verificate of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. (Bug #29955, Bug #34648)
- Microsoft Access would be unable to use `DBEngine.RegisterDatabase` to create a DSN using the MySQL Connector/ODBC driver. (Bug #33825)
- Using `SqlGetData` in combination with `SQL_C_WCHAR` would return overlapping data. (Bug #34429)
- Inserting characters to a UTF8 table using surrogate pairs would fail and insert invalid data. (Bug #34672)
- MySQL Connector/ODBC erroneously reported that it supported the `CAST()` and `CONVERT()` ODBC functions for parsing values in SQL statements, which could lead to bad SQL generation during a query. (Bug #33808)
- The dropdown selection for databases on a server when creating a DSN was too small. The list size now automatically adjusts up to a maximum size of 20 potential databases. (Bug #33918)

- Installation of MySQL Connector/ODBC would fail because it was unable to uninstall a previous installed version. The file being requested would match an older release version than any installed version of the connector. (Bug #34522)
- Descriptor records were not cleared correctly when calling `SQLFreeStmt(SQL_UNBIND)`. (Bug #34271)
- Using a linked table in Access 2003 where the table has a `BIGINT` column as the first column in the table, and is configured as the primary key, shows `#DELETED` for all rows of the table. (Bug #24535)
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. (Bug #19065)

D.2.1.9. Changes in MySQL Connector/ODBC 5.1.2 (13 February 2008)

MySQL Connector/ODBC 5.1.2-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the second beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Platform-Specific Notes

- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

  References: See also Bug #34571.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

Functionality Added or Changed

- Explicit descriptors are implemented. (Bug #32064)
- `SQLForeignKeys` uses `INFORMATION_SCHEMA` when it is available on the server, which enables more complete information to be returned.
- Disabled `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` when using an SSL connection.
- Changed `SQL_ATTR_PARAMSET_SIZE` to return an error until support for it is implemented.
- A full implementation of SQLForeignKeys based on the information available from INFORMATION_SCHEMA in 5.0 and later versions of the server has been implemented.

Bugs Fixed

- Specifying a nonexistent database name within the GUI dialog would result in an empty list, not an error. (Bug #33615)
- The `SSLCIPHER` option would be incorrectly recorded within the SSL configuration on Windows. (Bug #33897)
- Within the GUI interface, when connecting to a MySQL server on a nonstandard port, the connection test within the GUI would fail. The issue was related to incorrect parsing of numeric values within the DSN when the option was not configured as the last parameter within the DSN. (Bug #33822)
- When deleting rows from a static cursor, the cursor position would be incorrectly reported. (Bug #33388)
- Retrieving data from a `BLOB` column would fail within `SQLGetData`when the target data type was `SQL_C_WCHAR` due to incorrect handling of the character buffer. (Bug #32684)
- `SQLGetInfo()` reported characters for `SQL_SPECIAL_CHARACTERS` that were not encoded correctly. (Bug #33130)
- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. (Bug #31165)

- Reading a `TEXT` column that had been used to store UTF8 data would result in the wrong information being returned during a query. (Bug #28617)
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

  The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

  - `SQLColumns`
  - `SQLColAttribute`
  - `SQLColAttributes`
  - `SQLDescribeCol`
  - `SQLSpecialColumns` (theoretically can have the same problem)

  (Bug #12805, Bug #30890)
- `SQLForeignKeys` would return an empty string for the schema columns instead of `NULL`. (Bug #19923)
- Dynamic cursors on statements with parameters were not supported. (Bug #11846)
- Evaluating a simple numeric expression when using the OLEDB for ODBC provider and ADO would return an error, instead of the result. (Bug #10128)
- Adding or updating a row using `SQLSetPos()` on a result set with aliased columns would fail. (Bug #6157)

D.2.1.10. Changes in MySQL Connector/ODBC 5.1.1 (13 December 2007)

MySQL Connector/ODBC 5.1.1-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the first beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Includes changes from Connector/ODBC 3.51.21 and 3.51.22.

Built using MySQL 5.0.52.

Platform-Specific Notes

- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

  References: See also Bug #34571.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

Functionality Added or Changed

- **Incompatible Change**: Do not permit `SET NAMES` in initial statement and in executed statements.
- **Incompatible Change**: Removed monitor (myodbc3m) and dsn-editor (myodbc3c).
- **Incompatible Change**: Replaced myodbc3i (now myodbc-installer) with MySQL Connector/ODBC 5.0 version.
- Added MSI installer for Windows 64-bit. (Bug #31510)
- A wrapper for the `SQLGetPrivateProfileStringW()` function, which is required for Unicode support, has been cre-

ated. This function is missing from the unixODBC driver manager. (Bug #32685)

- Implemented support for `SQLCancel()`. (Bug #15601)
- The Windows installer now places files in a subdirectory of the `Program Files` directory instead of the Windows system directory.
- Replaced the internal library which handles creation and loading of DSN information. The new library, which was originally a part of MySQL Connector/ODBC 5.0, supports Unicode option values.
- Implemented native Windows setup library
- Added support for `SQL_NUMERIC_STRUCT`. (Bug #3028, Bug #24920)
- Removed nonthreadsafe configuration of the driver. The driver is now always built against the threadsafe version of libmysql.

Bugs Fixed

- ADO was unable to open record set using dynamic cursor. (Bug #32014)
- `SQLDescribeColW` returned UTF-8 column as `SQL_VARCHAR` instead of `SQL_WVARCHAR`. (Bug #32161)
- `SQLSetPos` with `SQL_DELETE` advances dynamic cursor incorrectly. (Bug #29765)
- ADO applications would not open a `RecordSet` that contained a `DECIMAL` field. (Bug #31720)
- Using an ODBC prepared statement with bound columns would produce an empty result set when called immediately after inserting a row into a table. (Bug #29239)
- The `SET NAMES` statement has been disabled because it causes problems in the ODBC driver when determining the current client character set. (Bug #32596)
- Memory usage would increase considerably. (Bug #31115)
- SQL statements are limited to 64KB. (Bug #30983, Bug #30984)
- Recordset `Update()` fails when using `adUseClient` cursor. (Bug #26985)
- ADO Not possible to update a client side cursor. (Bug #27961)
- MySQL Connector/ODBC would fail to connect to the server if the password contained certain characters, including the semicolon and other punctuation marks. (Bug #16178)
- Diagnostics were not correctly cleared on connection and environment handles.
- `SQLCopyDesc()` did not correctly copy all records.
- `SQL_ODBC_SQL_CONFORMANCE` was not handled by `SQLGetInfo()`.
- NULL pointers passed to `SQLGetInfo()` could result in a crash.
- `SQLError()` incorrectly cleared the error information, making it unavailable from subsequent calls to `SQLGetDiagRec()`.
- `SQLSetConnectAttr()` did not clear previous errors, possibly confusing `SQLError()`.
- Fixed `SQL_ATTR_PARAM_BIND_OFFSET`, and fixed row offsets to work with updatable cursors.

D.2.1.11. Changes in MySQL Connector/ODBC 5.1.0 (10 September 2007)

This release is the first of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a alpha release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data. Not all of the features planned for the final Connector/ODBC 5.1 release are implemented.

Functionality is based on Connector/ODBC 3.51.20.

Platform-Specific Notes

- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

  References: See also Bug #34571.

- There are no installer packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

Functionality Added or Changed

- Added support for `SQL_C_WCHAR`.
- Added descriptor support (`SQLGetDescField`, `SQLGetDescRec`, etc).
- Added support for Unicode functions (`SQLConnectW`, etc).

D.2.2. Changes in MySQL Connector/ODBC Version 5.0.x

D.2.2.1. Changes in MySQL Connector/ODBC 5.0.12 (Never released)

> **Note**
>
> Development on Connector/ODBC 5.0.x has ceased. New features and functionality will be incorporated into Connector/ODBC 5.1.

Bugs Fixed

- Inserting `NULL` values into a `DATETIME` column from Access reports an error. (Bug #27896)
- Tables with `TEXT` columns would be incorrectly identified, returning an `Unknown SQL type - 65535` error. (Bug #20127)

D.2.2.2. Changes in MySQL Connector/ODBC 5.0.11 (31 January 2007)

Functionality Added or Changed

- Driver now builds and is partially tested under Linux with the iODBC driver manager.
- Added support for ODBC v2 statement options using attributes.

Bugs Fixed

- Transaction support has been added and tested. (Bug #25045)
- Updates of `MEMO` or `TEXT` columns from within Microsoft Access would fail. (Bug #25263)
- Internal function, `my_setpos_delete_ignore()` could cause a crash. (Bug #22796)
- Connection string parsing for DSN-less connections could fail to identify some parameters. (Bug #25316)
- Fixed the binding of certain integer types.
- Fixed occasional mis-handling of the `SQL_NUMERIC_C` type.

D.2.2.3. Changes in MySQL Connector/ODBC 5.0.10 (14 December 2006)

Connector/ODBC 5.0.10 is the sixth BETA release.

Functionality Added or Changed

- Significant performance improvement when retrieving large text fields in pieces using `SQLGetData()` with a buffer smaller than the whole data. Mainly used in Access when fetching very large text fields. (Bug #24876)
- Added initial support for removing braces when calling stored procedures and retrieving result sets from procedure calls. (Bug #24485)
- Added initial unicode support in data and metadata. (Bug #24837)
- Added loose handling of retrieving some diagnostic data. (Bug #15782)
- Added wide-string type info for `SQLGetTypeInfo()`.

Bugs Fixed

- Editing DSN no longer crashes ODBC data source administrator. (Bug #24675)
- String query parameters are new escaped correctly. (Bug #19078)

D.2.2.4. Changes in MySQL Connector/ODBC 5.0.9 (22 November 2006)

Connector/ODBC 5.0.9 is the fifth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality Added or Changed

- Added recognition of `SQL_C_SHORT` and `SQL_C_TINYINT` as C types.
- Added support for column binding as SQL_NUMERIC_STRUCT.

Bugs Fixed

- Fixed SQLGetData to clear the NULL indicator correctly during multiple calls.
- Corrected retrieval multiple field types bit and blob/text.
- Fixed statistics to fail if it couldn't be completed.
- Catch use of `SQL_ATTR_PARAMSET_SIZE` and report error until we fully support.
- ODBC v2 behavior in driver now supports ODBC v3 date/time types (since DriverManager maps them).
- Fixed buffer length return for SQLDriverConnect.
- Added limit of display size when requested using `SQLColAttribute`/`SQL_DESC_DISPLAY_SIZE`.
- Fixed wildcard handling of and listing of catalogs and tables in `SQLTables`.

D.2.2.5. Changes in MySQL Connector/ODBC 5.0.8 (17 November 2006)

Connector/ODBC 5.0.8 is the fourth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality Added or Changed

- Wildcards now support escaped chars and underscore matching (needed to link tables with underscores in access).
- Made distinction between `CHAR`/`BINARY` (and VAR versions).
- Fixed display size to be length if max length isn’t available.

- Also made `SQL_DESC_NAME` only fill in the name if there was a data pointer given, otherwise just the length.

Bugs Fixed

- Fixed string length to chars, not bytes, returned by SQLGetDiagRec.
- Fix size return from `SQLDescribeCol`.
- Fixed type returned for `MYSQL_TYPE_LONG` to `SQL_INTEGER` instead of `SQL_TINYINT`.
- Fixed handling of numeric pointers in SQLColAttribute.
- Updated retrieval of descriptor fields to use the right pointer types.
- Length now used when handling bind parameter (needed in particular for `SQL_WCHAR`) - this enables updating char data in MS Access.
- Allow SQLDescribeCol to be called to retrieve the length of the column name, but not the name itself.
- Fixed MDiagnostic to use correct v2/v3 error codes.
- Set default return to `SQL_SUCCESS` if nothing is done for `SQLSpecialColumns`.
- Fixed using wrong pointer for `SQL_MAX_DRIVER_CONNECTIONS` in `SQLGetInfo`.
- Fixed binding using `SQL_C_LONG`.

D.2.2.6. Changes in MySQL Connector/ODBC 5.0.7 (08 November 2006)

Connector/ODBC 5.0.7 is the third BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality Added or Changed

- Improved trace/log.
- Added support for `SQLStatistics` to `MYODBCShell`.

Bugs Fixed

- Fixed `SQLDescribeCol` returning column name length in bytes rather than chars.
- Corrected incorrect column index within `SQLStatistics`. Many more tables can now be linked into MS Access.
- SQLBindParameter now handles `SQL_C_DEFAULT`.

D.2.2.7. Changes in MySQL Connector/ODBC 5.0.6 (03 November 2006)

Connector/ODBC 5.0.6 is the second BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Features, Limitations, and Notes on this Release

- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).
- MySQL Connector/ODBC supports both `User` and `System` DSNs.

Bugs Fixed

- Installation is provided in the form of a standard Microsoft System Installer (MSI).
- MySQL Connector/ODBC supports both `User` and `System` DSNs.
- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.

D.2.2.8. Changes in MySQL Connector/ODBC 5.0.5 (17 October 2006)

Connector/ODBC 5.0.5 is the first BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

You no longer have to have Connector/ODBC 3.51 installed before installing this version.

Bugs Fixed

- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.

D.2.2.9. Changes in Connector/ODBC 5.0.3 (Connector/ODBC 5.0 Alpha 3) (20 June 2006)

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release:

- The following ODBC API functions have been added in this release:
  - `SQLBindParameter`
  - `SQLBindCol`

D.2.2.10. Changes in Connector/ODBC 5.0.2 (Never released)

Connector/ODBC 5.0.2 was an internal implementation and testing release.

D.2.2.11. Changes in Connector/ODBC 5.0.1 (Connector/ODBC 5.0 Alpha 2) (05 June 2006)

Features, limitations and notes on this release:

- Connector/ODBC 5.0 is Unicode aware.
- Connector/ODBC is currently limited to basic applications. ADO applications and Microsoft Office are not supported.
- Connector/ODBC must be used with a Driver Manager.
- The following ODBC API functions are implemented:
  - `SQLAllocHandle`
  - `SQLCloseCursor`
  - `SQLColAttribute`
  - `SQLColumns`
  - `SQLConnect`
  - `SQLCopyDesc`
  - `SQLDisconnect`
  - `SQLExecDirect`
  - `SQLExecute`
  - `SQLFetch`

- SQLFreeHandle
- SQLFreeStmt
- SQLGetConnectAttr
- SQLGetData
- SQLGetDescField
- SQLGetDescRec
- SQLGetDiagField
- SQLGetDiagRec
- SQLGetEnvAttr
- SQLGetFunctions
- SQLGetStmtAttr
- SQLGetTypeInfo
- SQLNumResultCols
- SQLPrepare
- SQLRowcount
- SQLTables

The following ODBC API function are implemented, but not yet support all the available attributes/options:

- SQLSetConnectAttr
- SQLSetDescField
- SQLSetDescRec
- SQLSetEnvAttr
- SQLSetStmtAttr

D.2.3. Changes in MySQL Connector/ODBC Version 3.51.x

D.2.3.1. Changes in MySQL Connector/ODBC 3.51.30 (02 February 2012)

Bugs Fixed

- SQLFetch has to return error if indicator pointer is NULL for NULL value. (Bug #13542600)
- In some cases, a TIMESTAMP field could be described as SQL_NO_NULLS. (Bug #13532987)
- A failure on one statement causes another statement to fail. (Bug #13097201, Bug #62657)
- Describing a view or table caused SQLPrepare to prefetch table data. For large tables this created an intolerable performance hit. (Bug #46411)
- MySQL Connector/ODBC manually added a LIMIT clause to the end of certain SQL statements, causing errors for statements that contained code that should be positioned after the LIMIT clause. (Bug #49726)

D.2.3.2. Changes in MySQL Connector/ODBC 3.51.29 (04 October 2011)

Pluggable Authentication Notes

- The binaries for this distribution of Connector/ODBC can now connect to MySQL server accounts that use the PAM or Windows Native Authentication Plugins for authentication. See Section 5.5.6.2, “The PAM Authentication Plugin”, and Section 5.5.6.3, “The Windows Native Authentication Plugin”. These capabilities result from linking the Connector/ODBC binaries against the MySQL 5.5.16 `libmysql` rather than the MySQL 5.1 `libmysql` used previously. The newer `libmysql` includes the client-side support needed for the server-side PAM and Windows authentication plugins.

Bugs Fixed

- Some catalog functions (such as `SQLColumns()`, `SQLStatistics()`, and `SQLPrimaryKeys()`) would only return one row, when called after pre-execution failed. (Bug #12824839)
- An off-by-one error, where `sqlwcharchr` might read one `SQLWCHAR` after the end of a string. (Bug #61586)
- `SQLExecute` would return `SQL_SUCCESS_WITH_INFO` instead of `SQL_ERROR`, when column parameter binding was enabled. (Bug #59772)
- The Connector/ODBC driver did not call `mysql_thread_end()` when a thread ended, which caused error messages like: `Error in my_thread_global_end(): 1 threads didn't exit`. (Bug #57727)
- MS Access fields with `VARCHAR NOT NULL` columns could not be altered. (Bug #31067)

D.2.3.3. Changes in MySQL Connector/ODBC 3.51.28 (09 February 2011)

Bugs Fixed

- `SQLColAttribute(...SQL_DESC_CASE_SENSITIVE...)` returned `SQL_FALSE` for binary types and `SQL_TRUE` for the rest. It should have returned `SQL_TRUE` for binary types, and `SQL_FALSE` for the rest. (Bug #54212)
- `SQLColAttribute` for `SQL_DESC_OCTET_LENGTH` returned length including terminating null byte. It should not have included the null byte. (Bug #54206)
- If `NO_BACKSLASH_ESCAPES` mode was used on a server, escaping binary data led to server query parsing errors. (Bug #49029)
- When using MySQL Connector/ODBC to fetch data, if a `net_write_timeout` condition occurred, the operation returned the standard "end of data" status, rather than an error. (Bug #39878)
- Inserting a new record using `SQLSetPos` did not correspond to the database name specified in the `SELECT` statement when querying tables from databases other than the current one.

  `SQLSetPos` attempted to do the `INSERT` in the current database, but finished with a `SQL_ERROR` result and “Table does not exist” message from MySQL Server. (Bug #41946)
- No result record was returned for `SQLGetTypeInfo` for the `TIMESTAMP` data type. An application would receive the result `return code 100 (SQL_NO_DATA_FOUND)`. (Bug #30626)
- Microsoft Access was not able to read `BIGINT` values properly from a table with just two columns of type `BIGINT` and `VARCHAR`. `#DELETE` appeared instead of the correct values. (Bug #17679)

D.2.3.4. Changes in MySQL Connector/ODBC 3.51.27 (20 November 2008)

Bugs Fixed

- The client program hung when the network connection to the server was interrupted. (Bug #40407)
- The connection string option `Enable Auto-reconnect` did not work. When the connection failed, it could not be restored, and the errors generated were the same as if the option had not been selected. (Bug #37179)
- It was not possible to use MySQL Connector/ODBC to connect to a server using SSL. The following error was generated:

```
Runtime error '-2147467259 (80004005)':

[MySQL][ODBC 3.51 Driver]SSL connection error.
```

  (Bug #29955)

D.2.3.5. Changes in MySQL Connector/ODBC 3.51.26 (07 July 2008)

Functionality Added or Changed

- There is a new connection option, `FLAG_NO_BINARY_RESULT`. When set this option disables charset 63 for columns with an empty `org_table`. (Bug #29402)

Bugs Fixed

- When an `ADOConnection` is created and attempts to open a schema with `ADOConnection.OpenSchema` an access violation occurs in `myodbc3.dll`. (Bug #30770)
- When `SHOW CREATE TABLE` was invoked and then the field values read, the result was truncated and unusable if the table had many rows and indexes. (Bug #24131)

D.2.3.6. Changes in MySQL Connector/ODBC 3.51.25 (11 April 2008)

Bugs Fixed

- The driver crashes ODBC Administrator on attempting to add a new DSN. (Bug #32057)
- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE (SQL_COLUMN_MONEY)` attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. (Bug #35581)
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

  The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

  - `SQLColumns`
  - `SQLColAttribute`
  - `SQLColAttributes`
  - `SQLDescribeCol`
  - `SQLSpecialColumns` (theoretically can have the same problem)

  (Bug #12805, Bug #30890)

D.2.3.7. Changes in MySQL Connector/ODBC 3.51.24 (14 March 2008)

Bugs Fixed

- **Security Enhancement**: Accessing a parameter with the type of `SQL_C_CHAR`, but with a numeric type and a length of zero, the parameter marker would get stripped from the query. In addition, an SQL injection was possible if the parameter value had a nonzero length and was not numeric, the text would be inserted verbatim. (Bug #34575)
- **Important Change**: In previous versions, the SSL certificate would automatically be verified when used as part of the MySQL Connector/ODBC connection. The default mode is now to ignore the verificate of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. (Bug #29955, Bug #34648)
- When creating a System DSN using the ODBC Administrator on Mac OS X, a User DSN would be created instead. The root cause is a problem with the iODBC driver manager used on Mac OS X. The fix works around this issue.

  > **Note**
  >
  > ODBC Administrator may still be unable to register a System DSN unless the `/Library/ODBC/odbc.ini` file has the correct permissions. You should ensure that the file is writable by the `admin` group.

  (Bug #31495)

- Calling `SQLFetch` or `SQLFetchScroll` would return negative data lengths when using `SQL_C_WCHAR`. (Bug #31220)
- Using tables with a single quote or other nonstandard characters in the table or column names through ODBC would fail. (Bug #32989)
- When using ADO, the count of parameters in a query would always return zero. (Bug #33298)
- When using Crystal Reports, table and column names would be truncated to 21 characters, and truncated columns in tables where the truncated name was the duplicated would lead to only a single column being displayed. (Bug #32864)
- When using the ODBC `SQL_TXN_READ_COMMITTED` option, 'dirty' records would be read from tables as if the option had not been applied. (Bug #31959)
- `SQLExtendedFetch()` and `SQLFetchScroll()` ignored the rowset size if the `Don't cache result` DSN option was set. (Bug #32420)
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length -1). (Bug #29871)
- Using `connection.Execute` to create a record set based on a table without declaring the cmd option as `adCmdTable` will fail when communicating with versions of MySQL 5.0.37 and higher. The issue is related to the way that `SQLSTATE` is returned when ADO tries to confirm the existence of the target object. (Bug #27158)
- Static cursor was unable to be used through ADO when dynamic cursors were enabled. (Bug #27351)
- With some connections to MySQL databases using MySQL Connector/ODBC, the connection would mistakenly report 'user cancelled' for accesses to the database information. (Bug #16653)
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. (Bug #19065)

D.2.3.8. Changes in MySQL Connector/ODBC 3.51.23 (09 January 2008)

Platform-Specific Notes

- There are no installer packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

Bugs Fixed

- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. (Bug #31165)
- Cleaning up environment handles in multithread environments could result in a five (or more) second delay. (Bug #32366)
- When using unixODBC or directly linked applications where the thread level is set to less than 3 (within `odbcinst.ini`), a thread synchronization issue would lead to an application crash. This was because `SQLAllocStmt()` and `SQLFreeStmt()` did not synchronize access to the list of statements associated with a connection. (Bug #32587)
- MySQL Connector/ODBC would incorrectly return `SQL_SUCCESS` when checking for distributed transaction support. (Bug #32727)
- Setting the default database using the `DefaultDatabase` property of an ADO `Connection` object would fail with the error `Provider does not support this property`. The `SQLGetInfo()` returned the wrong value for `SQL_DATABASE_NAME` when no database was selected. (Bug #3780)

D.2.3.9. Changes in MySQL Connector/ODBC 3.51.22 (13 November 2007)

Functionality Added or Changed

- The workaround for this bug was removed due to the fixes in MySQL Server 5.0.48 and 5.1.21.

  References: This bug was introduced by Bug #10491.

Bugs Fixed

- Unsigned integer values greater than the maximum value of a signed integer would be handled incorrectly. (Bug #32171)
- When accessing information about supported operations, the driver would return incorrect information about the support for `UNION`. (Bug #32253)
- The `English` locale would be used when formatting floating point values. The `C` locale is now used for these values. (Bug #32294)
- The wrong result was returned by `SQLGetData()` when the data was an empty string and a zero-sized buffer was specified. (Bug #30958)
- Added the `FLAG_COLUMN_SIZE_S32` option to limit the reported column size to a signed 32-bit integer. This option is automatically enabled for ADO applications to provide a work around for a bug in ADO. (Bug #13776)

D.2.3.10. Changes in MySQL Connector/ODBC 3.51.21 (08 October 2007)

Bugs Fixed

- Uninitiated memory could be used when C/ODBC internally calls `SQLGetFunctions()`. (Bug #31055)
- When using a rowset/cursor and add a new row with a number of fields, subsequent rows with fewer fields will include the original fields from the previous row in the final `INSERT` statement. (Bug #31246)
- Not specifying a user in the DSN dialog would raise a warning even though the parameter is optional. (Bug #30499)
- The wrong `SQL_DESC_LITERAL_PREFIX` would be returned for date/time types. (Bug #31009)
- The wrong `COLUMN_SIZE` would be returned by `SQLGetTypeInfo` for the TIME columns (`SQL_TYPE_TIME`). (Bug #30939)
- Clicking outside the character set selection box when configuring a new DSN could cause the wrong character set to be selected. (Bug #30568)
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length -1). (Bug #29871)
- When using ADO, a column marked as `AUTO_INCREMENT` could incorrectly report that the column permitted `NULL` values. This was dur to an issue with `NULLABLE` and `IS_NULLABLE` return values from the call to `SQLColumns()`. (Bug #26108)
- MySQL Connector/ODBC would return the wrong the error code when the server disconnects the active connection because the configured `wait_timeout` has expired. Previously it would return `HY000`. MySQL Connector/ODBC now correctly returns an `SQLSTATE` of `08S01`. (Bug #3456)

D.2.3.11. Changes in MySQL Connector/ODBC 3.51.20 (10 September 2007)

Bugs Fixed

- The wrong column size was returned for binary data. (Bug #30547)
- The specified length of the user name and authentication parameters to `SQLConnect()` were not being honored. (Bug #30774)
- `SQLGetData()` will now always return `SQL_NO_DATA_FOUND` on second call when no data left, even if requested size is 0. (Bug #30520)
- Using `FLAG_NO_PROMPT` doesn't suppress the dialogs normally handled by `SQLDriverConnect`. (Bug #30840)
- `SQLGetConnectAttr()` did not reflect the connection state correctly. (Bug #14639)
- Removed check box in setup dialog for `FLAG_FIELD_LENGTH` (identified as `Don't Optimize Column Width` within the GUI dialog), which was removed from the driver in 3.51.18.

D.2.3.12. Changes in MySQL Connector/ODBC 3.51.19 (10 August 2007)

Connector/ODBC 3.51.19 fixes a specific issue with the 3.51.18 release. For a list of changes in the 3.51.18 release, see Section D.2.3.13, “Changes in MySQL Connector/ODBC 3.51.18 (08 August 2007)”.

Functionality Added or Changed

- Because of Bug #10491 in the server, character string results were sometimes incorrectly identified as `SQL_VARBINARY`. Until this server bug is corrected, the driver will identify all variable-length strings as `SQL_VARCHAR`.

D.2.3.13. Changes in MySQL Connector/ODBC 3.51.18 (08 August 2007)

Platform-Specific Notes

- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.
- Binary packages as disk images with installers are now available for Mac OS X.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

Functionality Added or Changed

- **Incompatible Change**: The `FLAG_DEBUG` option was removed.
- When connecting to a specific database when using a DSN, the system tables from the `mysql` database are no longer also available. Previously, tables from the mysql database (catalog) were listed as `SYSTEM TABLES` by `SQLTables()` even when a different catalog was being queried. (Bug #28662)
- Installed for Mac OS X has been re-instated. The installer registers the driver at a system (not user) level and makes it possible to create both user and system DSNs using the MySQL Connector/ODBC driver. The installer also fixes the situation where the necessary drivers would bge installed local to the user, not globally. (Bug #15326, Bug #10444)
- MySQL Connector/ODBC now supports batched statements. To enable cached statement support, you must switch enable the batched statement option (`FLAG_MULTI_STATEMENTS`, 67108864, or **Allow multiple statements** within a GUI configuration). Be aware that batched statements create an increased chance of SQL injection attacks and you must ensure that your application protects against this scenario. (Bug #7445)
- The `SQL_ATTR_ROW_BIND_OFFSET_PTR` is now supported for row bind offsets. (Bug #6741)
- The `TRACE` and `TRACEFILE` DSN options have been removed. Use the ODBC driver manager trace options instead.

Bugs Fixed

- Getting table metadata (through the `SQLColumns()` would fail, returning a bad table definition to calling applications. (Bug #29888)
- When using a table with multiple `TIMESTAMP` columns, the final `TIMESTAMP` column within the table definition would not be updatable. Note that there is still a limitation in MySQL server regarding multiple `TIMESTAMP` columns. (Bug #30081)

  References: See also Bug #9927.
- Fixed an issue where the `myodbc3i` would update the user ODBC configuration file (`~/Library/ODBC/odbcinst.ini`) instead of the system `/Library/ODBC/odbcinst.ini`. This was caused because `myodbc3i` was not honoring the `s` and `u` modifiers for the `-d` command-line option. (Bug #29964)
- `DATETIME` column types would return `FALSE` in place of `SQL_SUCCESS` when requesting the column type information. (Bug #28657)
- The `SQL_COLUMN_TYPE`, `SQL_COLUMN_DISPLAY` and `SQL_COLUMN_PRECISION` values would be returned incorrectly by `SQLColumns()`, `SQLDescribeCol()` and `SQLColAttribute()` when accessing character columns, especially

those generated through `concat()`. The lengths returned should now conform to the ODBC specification. The `FLAG_FIELD_LENGTH` option no longer has any affect on the results returned. (Bug #27862)

- The `SQLColumns()` function could return incorrect information about `TIMESTAMP` columns, indicating that the field was not nullable. (Bug #14414)
- Obtaining the length of a column when using a character set for the connection of `utf8` would result in the length being returned incorrectly. (Bug #19345)
- The `SQLColumns()` function could return incorrect information about `AUTO_INCREMENT` columns, indicating that the field was not nullable. (Bug #14407)
- The `SQL_DATA_TYPE` column in `SQLColumns()` results did not report the correct value for date and time types.
- The wrong value for `DECIMAL_DIGITS` in `SQLColumns()` was reported for `FLOAT` and `DOUBLE` fields, as well as the wrong value for the scale parameter to `SQLDescribeCol()`, and the `SQL_DESC_SCALE` attribute from `SQLColAttribute()`.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- Binary packages as disk images with installers are now available for Mac OS X.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- `SQLConnect()` and `SQLDriverConnect()` were rewritten to eliminate duplicate code and ensure all options were supported using both connection methods. `SQLDriverConnect()` now only requires the setup library to be present when the call requires it.
- The wrong value for `SQL_DESC_TYPE` was returned for date and time types.
- The value for `SQL_DESC_FIXED_PREC_SCALE` was not returned correctly for values in MySQL 5.0 and later.
- The `SQL_DATETIME_SUB` column in SQLColumns() was not correctly set for date and time types.
- The wrong value from `SQL_DESC_LITERAL_SUFFIX` was returned for binary fields.
- `BIT(n)` columns are now treated as `SQL_BIT` data where `n = 1` and binary data where `n > 1`.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

D.2.3.14. Changes in MySQL Connector/ODBC 3.51.17 (14 July 2007)

Platform-Specific Notes

- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.
- Binary packages as disk images with installers are now available for Mac OS X.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

Functionality Added or Changed

- It is now possible to specify a different character set as part of the DSN or connection string. This must be used instead of the `SET NAMES` statement. You can also configure the character set value from the GUI configuration. (Bug #9498, Bug #6667)
- The setup library has been split into its own RPM package, to enable installing the driver itself with no GUI dependencies.

- Dis-allow NULL ptr for null indicator when calling SQLGetData() if value is null. Now returns SQL_ERROR w/state 22002.
- Fixed calling convention ptr and wrong free in `myodbc3i`, and fixed the null terminating (was only one, not two) when writing DSN to string.

Bugs Fixed

- `myodbc3i` did not correctly format driver info, which could cause the installation to fail. (Bug #29709)
- Fixed a problem where the GUI would crash when configuring or removing a System or User DSN. (Bug #27315)
- Fixed error handling of out-of-memory and bad connections in catalog functions. This might raise errors in code paths that had ignored them in the past. (Bug #26934)
- MySQL Connector/ODBC crashed with Crystal Reports due to a problem with `SQLProcedures()`. (Bug #28316)
- For a stored procedure that returns multiple result sets, MySQL Connector/ODBC returned only the first result set. (Bug #16817)
- Added a new DSN option (`FLAG_ZERO_DATE_TO_MIN`) to retrieve `XXXX-00-00` dates as the minimum permitted ODBC date (`XXXX-01-01`). Added another option (`FLAG_MIN_DATE_TO_ZERO`) to mirror this but for bound parameters. `FLAG_MIN_DATE_TO_ZERO` only changes `0000-01-01` to `0000-00-00`. (Bug #13766)
- Calling `SQLGetDiagField` with `RecNumber 0, DiagIdentifier NOT 0` returned `SQL_ERROR`, preventing access to diagnostic header fields. (Bug #16224)
- The driver was using `mysql_odbc_escape_string()`, which does not handle the `NO_BACKSLASH_ESCAPES` SQL mode. Now it uses `mysql_real_escape_string()`, which does. (Bug #9498)
- `SQLColumns()` did not handle many of its parameters correctly, which could lead to incorrect results. The table name argument was not handled as a pattern value, and most arguments were not escaped correctly when they contained nonalphanumeric characters. (Bug #8860)
- When inserting a large `BLOB` field, MySQL Connector/ODBC would crash due to a memory allocation error. (Bug #10562)
- If there was more than one unique key on a table, the correct fields were not used in handling `SQLSetPos()`. (Bug #10563)
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- The binary packages for Sun Solaris are only provided as tarballs, not the PKG format.
- The Mac OS X binary packages are only provided as tarballs, there is no installer.
- Fixed possible crash if `SQLBindCol()` was not called before `SQLSetPos()`.
- Correctly return error if `SQLBindCol` is called with an invalid column.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no binary packages for Microsoft Windows x64 Edition.

D.2.3.15. Changes in MySQL Connector/ODBC 3.51.16 (14 June 2007)

Functionality Added or Changed

- MySQL Connector/ODBC now supports using SSL for communication. This is not yet exposed in the setup GUI, but must be enabled through configuration files or the DSN. (Bug #12918)

Bugs Fixed

- Calls to SQLNativeSql() could cause stack corruption due to an incorrect pointer cast. (Bug #28758)
- `SQLForeignKeys` does not escape `_` and `%` in the table name arguments. (Bug #27723)
- When using stored procedures, making a `SELECT` or second stored procedure call after an initial stored procedure call, the

second statement will fail. (Bug #27544)

- Using cursors on results sets with multi-column keys could select the wrong value. (Bug #28255)
- Return values from `SQLTables()` may be truncated. (Bug #22797)
- SQLTables() did not distinguish tables from views. (Bug #23031)
- Data in `TEXT` columns would fail to be read correctly. (Bug #16917)
- Using `BETWEEN` with date values, the wrong results could be returned. (Bug #15773)
- Specifying strings as parameters using the `adBSTR` or `adVarWChar` types, (`SQL_WVARCHAR` and `SQL_WLONGVARCHAR`) would be incorrectly quoted. (Bug #16235)
- SQL_WVARCHAR and SQL_WLONGVARCHAR parameters were not properly quoted and escaped. (Bug #16235)
- When using the `Don't Cache Results` (option value `1048576`) with Microsoft Access, the connection will fail using DAO/VisualBasic. (Bug #4657)

D.2.3.16. Changes in MySQL Connector/ODBC 3.51.15 (07 May 2007)

Bugs Fixed

- When inserting data using bulk statements (through `SQLBulkOperations`), the indicators for all rows within the insert would not updated correctly. (Bug #24306)
- An incorrect transaction isolation level may not be returned when accessing the connection attributes. (Bug #27589)
- The `SQLTransact()` function did not support an empty connection handle. (Bug #21588)
- Adding a new DSN with the `myodbc3i` utility under AIX would fail. (Bug #27220)
- Using `SQLProcedures` does not return the database name within the returned resultset. (Bug #23033)
- MySQL Connector/ODBC would incorrectly claim to support `SQLProcedureColumns` (by returning true when queried about `SQLPROCEDURECOLUMNS` with `SQLGetFunctions`), but this functionality is not supported. (Bug #27591)
- Using `SQLDriverConnect` instead of `SQLConnect` could cause later operations to fail. (Bug #7912)
- When using blobs and parameter replacement in a statement with `WHERE CURSOR OF`, the SQL is truncated. (Bug #5853)
- MySQL Connector/ODBC would return too many foreign key results when accessing tables with similar names. (Bug #4518)

D.2.3.17. Changes in MySQL Connector/ODBC 3.51.14 (08 March 2007)

Functionality Added or Changed

- Use of `SQL_ATTR_CONNECTION_TIMEOUT` on the server has now been disabled. If you attempt to set this attribute on your connection the `SQL_SUCCESS_WITH_INFO` will be returned, with an error number/string of `HYC00: Optional feature not supported`. (Bug #19823)
- Added auto is null option to MySQL Connector/ODBC option parameters. (Bug #10910)
- Added support for the `HENV` handlers in `SQLEndTran()`.
- Added auto-reconnect option to MySQL Connector/ODBC option parameters.

Bugs Fixed

- When retrieving `TIME` columns, C/ODBC would incorrectly interpret the type of the string and could interpret it as a `DATE` type instead. (Bug #25846)
- On 64-bit systems, some types would be incorrectly returned. (Bug #26024)

- MySQL Connector/ODBC may insert the wrong parameter values when using prepared statements under 64-bit Linux. (Bug #22446)
- Using MySQL Connector/ODBC, with `SQLBindCol` and binding the length to the return value from `SQL_LEN_DATA_AT_EXEC` fails with a memory allocation error. (Bug #20547)
- The `SQLDriverConnect()` ODBC method did not work with recent MySQL Connector/ODBC releases. (Bug #12393)
- The ODBC driver name and version number were incorrectly reported by the driver. (Bug #19740)
- Using `DataAdapter`, MySQL Connector/ODBC may continually consume memory when reading the same records within a loop (Windows Server 2003 SP1/SP2 only). (Bug #20459)
- When retrieving data from columns that have been compressed using `COMPRESS()`, the retrieved data would be truncated to 8KB. (Bug #20208)
- A string format exception would be raised when using iODBC, MySQL Connector/ODBC and the embedded MySQL server. (Bug #16535)

D.2.3.18. Changes in MySQL Connector/ODBC 3.51.13 (Never released)

Connector/ODBC 3.51.13 was an internal implementation and testing release.

Version 3.51.13 has no changelog entries.

D.2.3.19. Changes in MySQL Connector/ODBC 3.51.12 (11 February 2005)

Functionality Added or Changed

- N/A

Bugs Fixed

- Using stored procedures with ADO, where the `CommandType` has been set correctly to `adCmdStoredProc`, calls to stored procedures would fail. (Bug #15635)
- `SQLColumns()` returned no information for tables that had a column named using a reserved word. (Bug #9539)
- File DSNs could not be saved. (Bug #12019)

D.2.3.20. Changes in MySQL Connector/ODBC 3.51.11 (28 January 2005)

Bugs Fixed

- `mysql_list_dbcolumns()` and `insert_fields()` were retrieving all rows from a table. Fixed the queries generated by these functions to return no rows. (Bug #8198)
- `SQLGetTypoInfo()` returned `tinyblob` for `SQL_VARBINARY` and nothing for `SQL_BINARY`. Fixed to return `varbinary` for `SQL_VARBINARY`, `binary` for `SQL_BINARY`, and `longblob` for `SQL_LONGVARBINARY`. (Bug #8138)

D.3. MySQL Connector/Net Change History

D.3.1. Changes in MySQL Connector/Net Version 6.5.x

Changes in MySQL Connector/Net 6.5.4 (8 March 2012)

First GA release.

Bugs Fixed

- When creating a project in VisualStudio using a .NET framework such as 3.0 or 3.5 (anything less than 4.0), the Connector/Net

library (`MySql.Data.dll`) was not listed in the **ADD REFERENCES** dialog box. The workaround was to browse to the library and add it manually. (Bug #13491678, Bug #60462)

Changes in MySQL Connector/Net 6.5.3 (27 February 2012)

Second Release Candidate (RC) release.

Bugs Fixed

- Fixed `MySqlTime` parsing to avoid throwing an exception when handling milliseconds (as result of a `timediff` operation). (Bug #13708884, Bug #64268)

Changes in MySQL Connector/Net 6.5.2 (15 February 2012)

First Release Candidate (RC) release.

Bugs Fixed

- When using connection pooling, the connections in the pool were not automatically closed upon application exit. With the setting `log-warnings=2`, you could encounter `Aborted connection` errors in the MySQL error log. The workaround was to explicitly call `MySql.Data.MySqlClient.MySqlConnection.ClearAllPools();` upon exiting the application. (Bug #13629471, Bug #63942)
- If `MySqlCommand.CommandText` was equal to `null`, then `MySqlCommand.ExecuteReader()` would throw the wrong exception: `NullReferenceException` instead of `InvalidOperationException`. (Bug #13624659, Bug #64092)
- The MySQL script generated by using the function `CreateDatabaseScript` used names with incorrect singular/plural forms. (Bug #13582837, Bug #62150)
- When designating a primary key for a table in Table Designer, the key icon could fail to appear until the Table Designer was restarted. (Bug #13481246)

Changes in MySQL Connector/Net 6.5.1 (23 January 2012)

Second beta release.

Bugs Fixed

- IntelliSense would emit an error when the `"-"` (minus) character was typed. (Bug #13522344)
- After an `UPDATE` statement, Connector/Net would generate incorrect `SELECT` SQL statements if a value in the `WHERE` clause was not also present in the `SET` clause of the `UPDATE`. (Bug #13491689, Bug #62134)

Changes in MySQL Connector/Net 6.5.0 (22 December 2011)

First beta release.

Functionality Added or Changed

- Added better IntelliSense support, including auto-completion when editing stored procedures or `.mysql` files. For more information, see Section 21.2.3.2, “Using IntelliSense in the SQL Editor”.
- Adds a `MySqlClientPermission` class to help users define the security policies for the database connections within any application using a MySQL database.
- Added better partial-trust support, thus allowing Connector/NET to run in a partial trust scenario. It will work correctly in a medium-trust level environment when the library is installed in the GAC. For more information, see Section 21.2.5.18, “Working with Partial Trust”.
- Added fractional seconds support, as per MySQL Server 5.6 and above. For more information, see Section 10.3.5, “Fractional Seconds in Time Values”

- Added “interceptor” classes for exceptions and commands. For more information, see Section 21.2.5.10, “Using the Connector/Net Interceptor Classes”.

Bugs Fixed

- The `MySqlDataReader.GetDateTime()` method was not recognizing that `TIMESTAMP` values had already been converted to the local time zone of the MySQL server, which could cause incorrect results if the value was later processed through the `ToLocalTime()` method. The fix causes the `Kind` property to be correctly set to `Local` rather than `Unspecified`. (Bug #13591554, Bug #63812)
- Visual Studio 2010 Table Designer could give an error “Object reference not set to an instance of an object” for schemas with certain combinations of column names and foreign key references. The SQL syntax was incorrect for the `ALTER TABLE` statement generated by the Table Designer. (Bug #13591545, Bug #63714)

D.3.2. Changes in MySQL Connector/Net Version 6.4.x

D.3.2.1. Changes in MySQL Connector/Net 6.4.4 (26 September 2011)

This release fixes bugs since 6.4.3.

Functionality Added or Changed

- Connector/Net now enables clients to connect to the server through accounts that use Windows native authentication. For more information, see Section 21.2.5.5, “Using the Windows Native Authentication Plugin” and Section 5.5.6.3, “The Windows Native Authentication Plugin”.

Bugs Fixed

- (Bug #12897149)
- When creating a tableadapter through a Dataset form in Visual Studio, the `MaxLength` of the field for a `CHAR` column could be set to 3 times the length of the table column. Although this many bytes could be needed to hold a UTF-8 character value, the length value was not appropriate for restricting the length of a `TextBox`. (Bug #12860224, Bug #62094)
- An error `out of sync with server` could occur when connecting in the Visual Studio Entity Framework. The issue occurred only on some MySQL servers, all with versions earlier than MySQL 5.5. (Bug #12853286, Bug #61806)
- When adding a `MEDIUMTEXT` or `LONGTEXT` column Visual Studio, the facet `Fixed length` had to be set to `false`, even though these types allow arbitrary lengths. (Bug #12848277, Bug #54915)
- Using a combination of `ListView`, `EntityDataSource` with `TypeFilter` and `Include EntityCollection Navigation Property`, and `DataPager` caused a `NullReferenceException` error in the `System.Web.UI.WebControls.EntityDataSourceView.ExecuteSelect` function. (Bug #12776517, Bug #61714)
- Executing a “LINQ to Entity” query could result in a `NullReferenceException` error. (Bug #12776598, Bug #61729)
- `MySqlScript` was modified to enable correct processing of the `DELIMITER` command when not followed by a new line. (Bug #61680, Bug #12732279)
- `MySqlDataReader.Close` was modified to use Default behavior when clearing remaining result sets. (Bug #61690, Bug #12723423)
- On Model First changed column types generated in SQL scripts to produce more suitable `MySql` types. (Bug #59244, Bug #12707104)
- The ASP.NET membership provider was modified to create and query all related tables using lowercase names. (Bug #61108, Bug #12702009)

D.3.2.2. Changes in MySQL Connector/Net 6.4.3 (03 July 2011)

This release fixes bugs since 6.4.2.

Bugs Fixed

- `SchemaDefinition-5.5.ssdl` was modified to treat `CHAR(36)` columns as a GUID. (Bug #61657, Bug #12708208)
- `SqlFragment.QuoteIdentifier` was modified to add MySQL quotes around identifiers. (Bug #61635, Bug #12707285)

D.3.2.3. Changes in MySQL Connector/Net 6.4.2 (29 June 2011)

This release fixes bugs since 6.4.1.

Bugs Fixed

- Modified `MySqlConnection.BeginTransaction` to throw a `NotSupportedException` for `Snapshot` isolation level. (Bug #61589, Bug #12698020)
- Modified `ProviderManifest.xml` to map `TIMESTAMP` database columns to the `DateTime` .NET type. (Bug #55351, Bug #12652602)
- Fixed Entity Framework provider `GROUP BY` clause generation by adding all group-by keys to the `SELECT` statement. (Bug #46742, Bug #12622129)

D.3.2.4. Changes in MySQL Connector/Net 6.4.1 (06 June 2011, Alpha)

First alpha release.

Functionality Added or Changed

- Calling a stored procedure with output parameters caused a marked performance decrease. (Bug #60366, Bug #12425959)
- Changed how the procedure schema collection is retrieved. If the connection string contains "`use procedure bodies=true`" then a `SELECT` is performed on the `mysql.proc` table directly, as this is up to 50 times faster than the current Information Schema implementation. If the connection string contains "`use procedure bodies=false`", then the Information Schema collection is queried. (Bug #36694)

D.3.3. Changes in MySQL Connector/Net Version 6.3.x

D.3.3.1. Changes in MySQL Connector/Net 6.3.9 (Not yet released)

This release fixes bugs since 6.3.8.

Bugs Fixed

- In Visual Studio's Server Explorer, right-clicking on a table in the Tables tree and selecting Create Trigger could cause an error, `Object reference not set to an instance of an object`. (Bug #13511801)
- After an `UPDATE` statement, Connector/Net would generate incorrect `SELECT` SQL statements if a value in the `WHERE` clause was not also present in the `SET` clause of the `UPDATE`. (Bug #13491689, Bug #62134)
- The class `MySql.Data.Types.MySqlDateTime` was not serializable. (Bug #11750161, Bug #40555)
- Connector/NET incorrectly maps `PrimitiveTypeKind.Byte` to `tinyint`, instead of `utinyint`. And `PrimitiveTypeKind.SByte` mapping was added, to `tinyint`. (Bug #62135, Bug #13061713)
- Connector/NET would incorrectly map decimal values to ANSI strings. (Bug #62246, Bug #13050570)
- On Model First changed column types generated in SQL scripts to produce more suitable `MySql` types. (Bug #59244, Bug #12707104)

D.3.3.2. Changes in MySQL Connector/Net 6.3.8 (16 December 2011)

This release fixes bugs since 6.3.7.

Bugs Fixed

- Visual Studio 2010 Table Designer could give an error “Object reference not set to an instance of an object” for schemas with certain combinations of column names and foreign key references. The SQL syntax was incorrect for the `ALTER TABLE` statement generated by the Table Designer. (Bug #13591545, Bug #63714)
- When creating a project in VisualStudio using a .NET framework such as 3.0 or 3.5 (anything less than 4.0), the Connector/Net library (`MySql.Data.dll`) was not listed in the **Add References** dialog box. The workaround was to browse to the library and add it manually. (Bug #13491678, Bug #60462)
- When a new column was added in Table Designer without selecting an associated data type, an error would occur trying to save the column definition. (Bug #13481298)
- When creating a foreign key relationship in Table Designer, changes to the `ON UPDATE` and `ON CASCADE` settings were not reflected in the actual table definition, as displayed by `SHOW CREATE TABLE`. (Bug #13481348)
- Removing a method was not affecting the indexes list of the table object, as defined within the Table Designer. (Bug #13481313)
- The columns added in descending sort order were not included in the index, as defined within the Server Explorer. (Bug #13481709)
- The comment property and index type were not added in the definition of the index, as defined within the Server Explorer. (Bug #13481314)
- The Connector/Net installed for all users, and thus was not available in the `Add/Remove Programs` dialog for users other than the one who installed it. (Bug #13447941)
- The default value for `VARCHAR` and `CHAR` field types would contain single quotation marks. (Bug #13442506)
- When creating a tableadapter through a Dataset form in Visual Studio, the `MaxLength` of the field for a `CHAR` column could be set to 3 times the length of the table column. Although this many bytes could be needed to hold a UTF-8 character value, the length value was not appropriate for restricting the length of a `TextBox`. (Bug #12860224, Bug #62094)
- When adding a `MEDIUMTEXT` or `LONGTEXT` column Visual Studio, the facet `Fixed length` had to be set to `false`, even though these types allow arbitrary lengths. (Bug #12848277, Bug #54915)
- Using a combination of `ListView`, `EntityDataSource` with `TypeFilter` and `Include EntityCollection Navigation Property`, and `DataPager` caused a `NullReferenceException` error in the `System.Web.UI.WebControls.EntityDataSourceView.ExecuteSelect` function. (Bug #12776517, Bug #61714)
- Executing a “LINQ to Entity” query could result in a `NullReferenceException` error. (Bug #12776598, Bug #61729)
- Connector/NET experienced poor performance when adding parameters to the `MySQLCommand`. (Bug #62653, Bug #13331475)
- The Unicode quotation mark character `U+0022` was not escaped by the `MySQLHelper` class. (Bug #62585, Bug #13092886)
- Using a return parameter without a name resulted in an `IndexOutOfRangeException` exception. (Bug #62416, Bug #13006969)
- The `Mono` runtime did not support hashed passwords. (Bug #62203, Bug #13041618)
- Modified `MySqlConnection.BeginTransaction` to throw a `NotSupportedException` for `Snapshot` isolation level. (Bug #61589, Bug #12698020)
- `SchemaDefinition-5.5.ssdl` was modified to treat `CHAR(36)` columns as a GUID. (Bug #61657, Bug #12708208)
- `SqlFragment.QuoteIdentifier` was modified to add MySQL quotes around identifiers. (Bug #61635, Bug #12707285)
- `MySqlScript` was modified to enable correct processing of the `DELIMITER` command when not followed by a new line. (Bug #61680, Bug #12732279)
- `MySqlDataReader.Close` was modified to use Default behavior when clearing remaining result sets. (Bug #61690, Bug #12723423)
- Modified `ProviderManifest.xml` to map `TIMESTAMP` database columns to the `DateTime` .NET type. (Bug #55351, Bug #12652602)
- The ASP.NET membership provider was modified to create and query all related tables using lowercase names. (Bug #61108, Bug #12702009)

D.3.3.3. Changes in MySQL Connector/Net 6.3.7 (22 June 2011)

This release fixes bugs since 6.3.6.

Functionality Added or Changed

- Calling a stored procedure with output parameters caused a marked performance decrease. (Bug #60366, Bug #12425959)

Bugs Fixed

- `MySQLConnectionStringBuilder.ContainsKey()` incorrectly returned `false` when testing whether a keyword was part of the connection string. (Bug #11766671, Bug #59835)
- A `NullReferenceException` was thrown on disposal of a `TransactionScope` object. (Bug #59346, Bug #11766272)
- MySQL Connector/Net generated an exception when executing a query consisting of ';', for example:

```
mycmd(";",mycon)
mycmd.executenonquery()
```

  The exception generated was:

```
System.IndexOutOfRangeException: Index was outside the bounds of the array.
   at MySql.Data.MySqlClient.MySqlCommand.TrimSemicolons(String sql)
   at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
   at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
   at MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
```

  (Bug #59537, Bug #11766433)
- MySQL Connector/Net 6.3.6 did not work with Visual Studio 2010. (Bug #60723, Bug #12394470)
- `MysqlDataReader.GetSchemaTable` returned incorrect values and types. (Bug #59989, Bug #11776346)
- Setting `Membership.ApplicationName` had no effect. (Bug #59438, Bug #11770465)
- All queries other than `INSERT` were executed individually instead of as a batch even though batching was enabled for the connection. (Bug #59616, Bug #11850286)
- The setup wizard failed with the error “Setup Wizard ended prematurely because of an error”. This was because it assumed .NET Framework version 4.0 was located on the C: drive, when it was actually located on the E: drive. (Bug #59301)
- Fixed Entity Framework provider `GROUP BY` clause generation by adding all group-by keys to the `SELECT` statement. (Bug #46742, Bug #12622129)

D.3.3.4. Changes in MySQL Connector/Net 6.3.6 (03 January 2011)

This release fixes bugs since 6.3.5.

Functionality Added or Changed

- Changed how the procedure schema collection is retrieved. If the connection string contains “`use procedure bodies=true`” then a `SELECT` is performed on the `mysql.proc` table directly, as this is up to 50 times faster than the current Information Schema implementation. If the connection string contains “`use procedure bodies=false`”, then the Information Schema collection is queried. (Bug #36694)

Bugs Fixed

- The `MySqlTokenizer` contained unnecessary `Substring` and `Trim` calls:

```
string token = sql.Substring(startIndex, stopIndex - startIndex).Trim();
```

  The variable `token` was not used anywhere in the code. (Bug #58757)

- `MembershipProvider` did not generate hashes correctly if the algorithm was keyed. The Key of the algorithm should have been set if the `HashAlgorithm` was `KeyedHashAlgorithm`. (Bug #58906)
- When attempting to create an ADO.NET Entity Data Model, MySQL connections were not available. (Bug #58278)
- `MySqlCommand.ExecuteReader(CommandBehavior)` threw a `NullReferenceException` when being called with `CommandBehavior.CloseConnection`, if the SQL statement contained a syntax error, or contained invalid data such as an invalid column name. (Bug #58652)
- The ADO.NET Entity Data Model could not add stored procedures from MySQL Server 5.0.45 but worked fine using MySQL Server 5.1. (Bug #55349)
- Code introduced to fix bug #54863 proved problematic on .NET version 3.5 and above. (Bug #58853)
- `ReadFieldLength()` returned incorrect value for `BIGINT` autoincrement columns. (Bug #58373)
- Calling the `Read()` method on a `DataReader` obtained from `MySqlHelper.ExecuteReader` generated the following exception:

```
Unhandled Exception: MySql.Data.MySqlClient.MySqlException: Invalid attempt to R
ead when reader is closed.
   at MySql.Data.MySqlClient.MySqlDataReader.Read()
   at MySqlTest.MainClass.Main(String[] args)
```

  (Bug #57501)
- MySQL Connector/Net did not support the `utf8mb4` character set. When attempting to connect to `utf8mb4` tables or columns, an exception `KeyNotFoundException` was generated. (Bug #58244)
- Default values returned for text columns were not quoted. This meant that the `COLUMN_DEFAULT` field of the `GetSchema` columns collection did not return a valid SQL expression. (Bug #56509)
- When using MySQL Connector/Net on Mono 2.8 using .NET 4.0, attempting to connect to a MySQL database generated the following exception:

```
Unhandled Exception: System.MissingMethodException: Method not found:
 'System.Data.Common.DbConnection.EnlistTransaction'.
  at (wrapper remoting-invoke-with-check)
 MySql.Data.MySqlClient.MySqlConnection:Open ()
```

  (Bug #56509)
- When the tracing driver was used and an SQL statement was longer than 300 characters, an ArgumentOutOfRangeExcpetion occurred if the statement also contained a quoted character, and the 300th character was in the middle of a quoted token. (Bug #57641)
- MySQL Connector/Net for .NET/Mono attempted to dynamically load the assembly `Mono.Posix.dll` when a Unix socket was used to connect to the server. This failed and the connector was not able to use a Unix socket unless the `Mono.Posix.dll` assembly was previously loaded by the program. (Bug #56410)
- Installation of MySQL Connector/Net 6.3.5 failed. The error reported was:

```
MySQL Connector Net 6.3.5 Setup Wizard ended
prematurely because of an error. Your system has not been modified.
```

  (Bug #57654)
- In the ADO.NET Entity Data Model Wizard, the time to update a model scaled abnormally as the number of entities increased. (Bug #48791, Bug #12596237)

D.3.3.5. Changes in MySQL Connector/Net 6.3.5 (12 October 2010)

This release fixes bugs since 6.3.4.

Bugs Fixed

- A typed dataset did not get the table name. (Bug #57894, Bug #11764989)
- Setting `MySqlCommand.CommandTimeout` to 0 had no effect. It should have resulted in an infinite timeout. (Bug #57265)

- When an output parameter was declared as type `MySqlDbType.Bit`, it failed to return with the correct value. (Bug #56756)
- When performing a row-by-row update, only the first row was updated and all other rows were ignored. (Bug #57092)
- Setting the `Default Command Timeout` connection string option had no effect. (Bug #56806)
- MySQL Connector/Net experienced two problems as follows:

  1. A call to `System.Data.Objects.ObjectContext.DatabaseExists()` returned false, even if the database existed.

  2. A call to `System.Data.Objects.ObjectContext.CreateDatabase()` created a database but with a name other than the one specified in the connection string. It then failed to use it when EDM objects were processed.

  (Bug #56859)

- `MySqlHelper.ExecuteReader` did not include an overload accepting `MySqlParameter` objects when using a `MySqlConnection`. However, `MySqlHelper` did include an overload for `MySqlParameter` objects when using a string object containing the connection string to the database. (Bug #56755)
- MySQL Connector/Net 6.1.3 (GA) would not install on a Windows Server 2008 (Web Edition) clean installation. There were two problems:

  - If .NET framework version 4.0 was not installed, installation failed because c:\windows\microsoft.net\v4.0.* did not exist.
  - If .NET 4.0 was subsequently installed, then the following error was generated:

    ```
    InstallFiles: File: MySql.Data.Entity.dll,  Directory: ,  Size: 229888
    MSI (s) (E0:AC) [15:20:26:196]: Assembly Error:The assembly is built by a runtime newer
    than the currently loaded runtime, and cannot be loaded.
    MSI (s) (E0:AC) [15:20:26:196]: Note: 1: 1935 2:  3: 0x8013101B 4: IStream 5: Commit 6:
    MSI (s) (E0:A0) [15:20:26:196]: Note: 1: 1304 2: MySql.Data.Entity.dll
    Error 1304. Error writing to file: MySql.Data.Entity.dll. Verify that you have access to
    that directory.
    ```

  (Bug #56580)

D.3.3.6. Changes in MySQL Connector/Net 6.3.4 (01 September 2010, Generally Available)

First GA release. This release fixes bugs since 6.3.3.

Bugs Fixed

- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

  ```
  System.OverflowException : Value was either too large or too small for a Double.

  --OverflowException
  at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
  numfmt)
  at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMySqlValue.ReadValue(MySqlPacket
  packet, Int64 length, Boolean nullVal)
  at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
  IMySqlValue valObject)
  at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
  at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
  at MySql.Data.MySqlClient.MySqlDataReader.Read()
  ```

  (Bug #55644)

- The calculation of `lockAge` in the Session Provider sometimes generated a `System.Data.SqlTypes.SqlNullValueException`. (Bug #55701)
- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

  ```
  Unable to load object with error: Object reference not
  set to an instance of an object
  ```

  (Bug #55170)

- Calling `MySqlDataAdapter.Update(DataTable)` resulted in an unacceptable performance hit when updating large amounts of data. (Bug #55609)

- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. (Bug #50671)
- EventLog was not disposed in the SessionState provider. (Bug #52550)
- When attempting to carry out an operation such as:

```
from p in db.Products where p.PostedDate>=DateTime.Now select p;
```

  Where `p.PostedDate` is a `DateTimeOffset`, and the underlying column type is a `TIMESTAMP`, the following exception was generated:

```
MySqlException occurred
Unable to serialize date/time value
```

  MySQL Connector/Net has now been changed so that all `TIMESTAMP` columns will be surfaced as `DateTime`. (Bug #52550)
- The `INSERT` command was significantly slower with MySQL Connector/Net 6.x compared to 5.x, when compression was enabled. (Bug #48243)
- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. (Bug #44715)

D.3.3.7. Changes in MySQL Connector/Net 6.3.3 (27 July 2010)

This release fixes bugs since 6.3.2.

Bugs Fixed

- MySQL Connector/Net 6.3.2 failed to install on Windows Vista. (Bug #53975)
- MySQL Connector/Net did not process `Thread.Abort()` correctly, and failed to cancel queries currently running on the server. (Bug #54012)
- MySQL Connector/Net did not throw an `EndOfStreamException` exception when `net_write_timeout` was exceeded. (Bug #53439)
- The icon for the MySQL Web Configuration Tool was not displayed in Visual Studio for Web Application Projects. (Bug #54571)
- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. (Bug #54895)
- Several calls to `DataAdapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. (Bug #54863)
- MySQL Connector/Net generated a null reference exception when `TransactionScope` was used by multiple threads. (Bug #54681)
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adapter.Update` either generated an exception or failed to batch the commands, executing each insert individually. (Bug #54386)
- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. (Bug #54570)
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

  (Bug #53457)
- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception

was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
   MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
   Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
   Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
   Forecast.Page_Load(Object sender, EventArgs e) in ...:70
   System.Web.UI.Control.OnLoad(EventArgs e) +99
   System.Web.UI.Control.LoadRecursive() +50
   System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

(Bug #53357)

- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. (Bug #54152, Bug #53865)
- Membership schema creation failed if the default schema collation was not Latin1. (Bug #53174)
- `CHAR(36)` columns were not recognized as GUIDs when used in views with entity models. (Bug #52085)
- The MySQL Connector/Net installation failed due to `machine.config` files not being present in configuration folders.

  MySQL Connector/Net has been changed to skip over configuration folders that do not contain a `machine.config` file. (Bug #52352)
- When an application was subjected to increased concurrent load, MySQL Connector/Net generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\'
already belongs to this DataSet.
```

(Bug #49118)

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug #47153)
- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

  MySQL Connector/Net has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. (Bug #38411)
- Database name was emitted into typed datasets. This prevented users using the configured default database. (Bug #33870)

D.3.3.8. Changes in MySQL Connector/Net 6.3.2 (24 May 2010, beta)

First Beta release. This release fixes bugs since 6.3.1.

Functionality Added or Changed

- Procedure caching had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

  MySQL Connector/Net has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. (Bug #52562)
- MySQL Connector/Net has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. (Bug #47467)

Bugs Fixed

- After an exception, the internal datareader, `MySqlCommand.Connection.Reader`, was not properly closed (it was not set to null). If another query was subsequently executed on that command object an exception was generated with the message "There is already an open DataReader associated with this Connection which must be closed first." (Bug #55558)
- MySQL Connector/Net generated an exception when used to read a `TEXT` column containing more than 32767 bytes. (Bug #54040)
- In MySQL Connector/Net, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. (Bug #52769)
- The procedure cache affected the MySQL Connector/Net performance, reducing it by around 65%. This was due to unnecessary calls of `String.Format()`, related to debug logging. Even though the logging was disabled the string was still being formatted, resulting in impaired performance. (Bug #52475)
- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. (Bug #52187)
- In MySQL Connector/Net, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

  ```
  mapping.Add("latin1", new CharacterSet("latin1", 1));
  ```

  This meant that, for example, the Euro sign was not handled correctly.

  The correct mapping should have been:

  ```
  mapping.Add("latin1", new CharacterSet("windows-1252", 1));
  ```

  This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. (Bug #51927)
- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. (Bug #51788)
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. (Bug #49850)
- MySQL Connector/Net 6.3.1 failed to install. (Bug #51407, Bug #51604)
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

  ```
  Index and length must refer to a location within the string.
  Parameter name: length
  ```

  (Bug #51610)

D.3.3.9. Changes in MySQL Connector/Net 6.3.1 (02 March 2010)

This release fixes bugs since 6.3.0.

Functionality Added or Changed

- Connector/Net was not compatible with Visual Studio wizards that used square brackets to delimit symbols.

  Connector/Net has been changed to include a new connection string option `Sql Server mode` that supports use of square brackets to delimit symbols. (Bug #35852)

Bugs Fixed

- Binary Columns were not displayed in the Query Builder of Visual Studio. (Bug #50171)
- `MySqlCommand.Parameters.Clear()` did not work. (Bug #50444)
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. (Bug #50123)
- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it

did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. (Bug #51149)

- Specifying a connection string where an option had no value generated an error, rather than the value being set to the default. For example, a connection string such as the following would result in an error:

```
server=localhost;user=root;compress=;database=test;port=3306;password=123456;
```

(Bug #51209)

- When trying to create stored procedures from an SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
        MySql.Data.MySqlClient.MySqlException was unhandled
        Message="You have an error in your SQL syntax; check the manual that corresponds to your
        MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
        Source="MySql.Data"
        ErrorCode=-2147467259
        Number=1064
        StackTrace:
        à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
        à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
        lastInsertId)
        à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
        à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
      à MySql.Data.MySqlClient.MySqlScript.Execute()
```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug #46429)

- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. (Bug #41629)

D.3.3.10. Changes in MySQL Connector/Net 6.3.0 (16 February 2010, alpha)

First alpha release of 6.3.

Functionality Added or Changed

- Nested transaction scopes were not supported. MySQL Connector/Net now implements nested transaction scopes. A per-thread stack of scopes is maintained, which is necessary to handle nested scopes with the `RequiresNew` or `Suppress` options. (Bug #45098)

- Support for MySQL Server 4.1 has been removed from MySQL Connector/Net starting with version 6.3.0. The connector will now throw an exception if you try to connect to a server of version less than 5.0.

Bugs Fixed

- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. (Bug #48171)

- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. (Bug #48944)

- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be added. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. (Bug #48974)

D.3.4. Changes in MySQL Connector/Net Version 6.2.x

D.3.4.1. Changes in MySQL Connector/Net 6.2.6 (Not yet released)

This release fixes bugs since 6.2.5.

Bugs Fixed

- When creating a tableadapter through a Dataset form in Visual Studio, the `MaxLength` of the field for a `CHAR` column could be set to 3 times the length of the table column. Although this many bytes could be needed to hold a UTF-8 character value, the length value was not appropriate for restricting the length of a `TextBox`. (Bug #12860224, Bug #62094)
- Using a combination of `ListView`, `EntityDataSource` with `TypeFilter` and `Include EntityCollection Navigation Property`, and `DataPager` caused a `NullReferenceException` error in the `System.Web.UI.WebControls.EntityDataSourceView.ExecuteSelect` function. (Bug #12776517, Bug #61714)
- Executing a "LINQ to Entity" query could result in a `NullReferenceException` error. (Bug #12776598, Bug #61729)
- `MySqlScript` was modified to enable correct processing of the `DELIMITER` command when not followed by a new line. (Bug #61680, Bug #12732279)
- On Model First changed column types generated in SQL scripts to produce more suitable `MySql` types. (Bug #59244, Bug #12707104)
- The ASP.NET membership provider was modified to create and query all related tables using lowercase names. (Bug #61108, Bug #12702009)

D.3.4.2. Changes in MySQL Connector/Net 6.2.5 (01 July 2011)

This release fixes bugs since 6.2.4.

Bugs Fixed

- `MySQLConnectionStringBuilder.ContainsKey()` incorrectly returned `false` when testing whether a keyword was part of the connection string. (Bug #11766671, Bug #59835)
- Modified `MySqlConnection.BeginTransaction` to throw a `NotSupportedException` for `Snapshot` isolation level. (Bug #61589, Bug #12698020)
- `SchemaDefinition-5.5.ssdl` was modified to treat `CHAR(36)` columns as a GUID. (Bug #61657, Bug #12708208)
- `SqlFragment.QuoteIdentifier` was modified to add MySQL quotes around identifiers. (Bug #61635, Bug #12707285)
- Modified `ProviderManifest.xml` to map `TIMESTAMP` database columns to the `DateTime` .NET type. (Bug #55351, Bug #12652602)
- A `NullReferenceException` was thrown on disposal of a `TransactionScope` object. (Bug #59346, Bug #11766272)
- MySQL Connector/Net generated an exception when executing a query consisting of ';', for example:

```
mycmd(";",mycon)
mycmd.executenonquery()
```

  The exception generated was:

```
System.IndexOutOfRangeException: Index was outside the bounds of the array.
   at MySql.Data.MySqlClient.MySqlCommand.TrimSemicolons(String sql)
   at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
   at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
   at MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
```

  (Bug #59537, Bug #11766433)
- A typed dataset did not get the table name. (Bug #57894, Bug #11764989)
- `MysqlDataReader.GetSchemaTable` returned incorrect values and types. (Bug #59989, Bug #11776346)
- Setting `Membership.ApplicationName` had no effect. (Bug #59438, Bug #11770465)
- All queries other than `INSERT` were executed individually instead of as a batch even though batching was enabled for the connection. (Bug #59616, Bug #11850286)
- The `MySqlTokenizer` contained unnecessary `Substring` and `Trim` calls:

```
string token = sql.Substring(startIndex, stopIndex - startIndex).Trim();
```

The variable `token` was not used anywhere in the code. (Bug #58757)

- `MembershipProvider` did not generate hashes correctly if the algorithm was keyed. The Key of the algorithm should have been set if the `HashAlgorithm` was `KeyedHashAlgorithm`. (Bug #58906)
- `MySqlCommand.ExecuteReader(CommandBehavior)` threw a `NullReferenceException` when being called with `CommandBehavior.CloseConnection`, if the SQL statement contained a syntax error, or contained invalid data such as an invalid column name. (Bug #58652)
- The ADO.NET Entity Data Model could not add stored procedures from MySQL Server 5.0.45 but worked fine using MySQL Server 5.1. (Bug #55349)
- Code introduced to fix bug #54863 proved problematic on .NET version 3.5 and above. (Bug #58853)
- `ReadFieldLength()` returned incorrect value for `BIGINT` autoincrement columns. (Bug #58373)
- MySQL Connector/Net did not support the `utf8mb4` character set. When attempting to connect to `utf8mb4` tables or columns, an exception `KeyNotFoundException` was generated. (Bug #58244)
- Default values returned for text columns were not quoted. This meant that the `COLUMN_DEFAULT` field of the `GetSchema` columns collection did not return a valid SQL expression. (Bug #56509)
- MySQL Connector/Net for .NET/Mono attempted to dynamically load the assembly `Mono.Posix.dll` when a Unix socket was used to connect to the server. This failed and the connector was not able to use a Unix socket unless the `Mono.Posix.dll` assembly was previously loaded by the program. (Bug #56410)
- Setting `MySqlCommand.CommandTimeout` to 0 had no effect. It should have resulted in an infinite timeout. (Bug #57265)
- When an output parameter was declared as type `MySqlDbType.Bit`, it failed to return with the correct value. (Bug #56756)
- When performing a row-by-row update, only the first row was updated and all other rows were ignored. (Bug #57092)
- Setting the `Default Command Timeout` connection string option had no effect. (Bug #56806)
- `MySqlHelper.ExecuteReader` did not include an overload accepting `MySqlParameter` objects when using a `MySqlConnection`. However, `MySqlHelper` did include an overload for `MySqlParameter` objects when using a string object containing the connection string to the database. (Bug #56755)
- Fixed Entity Framework provider `GROUP BY` clause generation by adding all group-by keys to the `SELECT` statement. (Bug #46742, Bug #12622129)

D.3.4.3. Changes in MySQL Connector/Net 6.2.4 (30 August 2010)

This release fixes bugs since 6.2.3.

Functionality Added or Changed

- Procedure caching had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

  MySQL Connector/Net has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. (Bug #52562)

Bugs Fixed

- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.

--OverflowException
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMySqlValue.ReadValue(MySqlPacket
packet, Int64 length, Boolean nullVal)
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
IMySqlValue valObject)
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
```

```
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

(Bug #55644)

- The calculation of `lockAge` in the Session Provider sometimes generated a `System.Data.SqlTypes.SqlNullValueException`. (Bug #55701)
- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

```
Unable to load object with error: Object reference not
set to an instance of an object
```

(Bug #55170)

- After an exception, the internal datareader, `MySqlCommand.Connection.Reader`, was not properly closed (it was not set to null). If another query was subsequently executed on that command object an exception was generated with the message "There is already an open DataReader associated with this Connection which must be closed first." (Bug #55558)
- MySQL Connector/Net did not process `Thread.Abort()` correctly, and failed to cancel queries currently running on the server. (Bug #54012)
- MySQL Connector/Net did not throw an `EndOfStreamException` exception when `net_write_timeout` was exceeded. (Bug #53439)
- The icon for the MySQL Web Configuration Tool was not displayed in Visual Studio for Web Application Projects. (Bug #54571)
- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. (Bug #54895)
- Several calls to `DataAdapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. (Bug #54863)
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adapter.Update` either generated an exception or failed to batch the commands, executing each insert individually. (Bug #54386)
- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. (Bug #54570)
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

(Bug #53457)

- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
   MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
   Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
   Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
   Forecast.Page_Load(Object sender, EventArgs e) in ...:70
   System.Web.UI.Control.OnLoad(EventArgs e) +99
   System.Web.UI.Control.LoadRecursive() +50
   System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

(Bug #53357)

- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. (Bug #54152, Bug #53865)
- In the ADO.NET Entity Data Model Wizard, the time to update a model scaled abnormally as the number of entities increased. (Bug #48791, Bug #12596237)
- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. (Bug #50671)
- EventLog was not disposed in the SessionState provider. (Bug #52550)
- The `INSERT` command was significantly slower with MySQL Connector/Net 6.x compared to 5.x, when compression was enabled. (Bug #48243)
- Membership schema creation failed if the default schema collation was not Latin1. (Bug #53174)
- `CHAR(36)` columns were not recognized as GUIDs when used in views with entity models. (Bug #52085)
- When an application was subjected to increased concurrent load, MySQL Connector/Net generated the following error when calling stored procedures:

  ```
  A DataTable named \'Procedure Parameters\'
  already belongs to this DataSet.
  ```

  (Bug #49118)
- In MySQL Connector/Net, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. (Bug #52769)
- The procedure cache affected the MySQL Connector/Net performance, reducing it by around 65%. This was due to unnecessary calls of `String.Format()`, related to debug logging. Even though the logging was disabled the string was still being formatted, resulting in impaired performance. (Bug #52475)
- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. (Bug #52187)
- In MySQL Connector/Net, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

  ```
  mapping.Add("latin1", new CharacterSet("latin1", 1));
  ```

  This meant that, for example, the Euro sign was not handled correctly.

  The correct mapping should have been:

  ```
  mapping.Add("latin1", new CharacterSet("windows-1252", 1));
  ```

  This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. (Bug #51927)
- Periodically the session provider threw an `SqlNullValueException` exception. When this happened, the row within the `my_aspnet_Sessions` table had `locked` always set to '1'. The locked status never changed back to '0' and the user experienced the exception on every page, until their browser was closed and reopened (recreating a new sessionID), or the `locked` value was manually changed to '0'. (Bug #52175)
- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug #47153)
- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. (Bug #44715)
- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

  MySQL Connector/Net has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. (Bug #38411)

- Database name was emitted into typed datasets. This prevented users using the configured default database. (Bug #33870)

D.3.4.4. Changes in MySQL Connector/Net 6.2.3 (10 April 2010)

This release fixes bugs since 6.2.2.

Functionality Added or Changed

- MySQL Connector/Net has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. (Bug #47467)

Bugs Fixed

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. (Bug #51788)
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. (Bug #49850)
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

```
Index and length must refer to a location within the string.
Parameter name: length
```

  (Bug #51610)
- Binary Columns were not displayed in the Query Builder of Visual Studio. (Bug #50171)
- `MySqlCommand.Parameters.Clear()` did not work. (Bug #50444)
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. (Bug #50123)
- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. (Bug #51149)
- Specifying a connection string where an option had no value generated an error, rather than the value being set to the default. For example, a connection string such as the following would result in an error:

```
server=localhost;user=root;compress=;database=test;port=3306;password=123456;
```

  (Bug #51209)
- When the `MySqlScript.execute()` method was called, the following exception was generated:

```
InvalidOperationException : The CommandText property has not been properly initialized.
```

  (Bug #50344)
- When using the Compact Framework the following exception occurred when attempting to connect to a MySQL Server:

```
System.InvalidOperationException was unhandled
  Message="Timeouts are not supported on this stream."
```

  (Bug #50321)
- A `FormatException` was generated when an empty string was returned from a stored function. (Bug #49642)
- `MySqlDataReader.GetUInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. (Bug #49794)
- Calling a User Defined Function using Entity SQL in the Entity Framework caused a `NullReferenceException`. (Bug #45277)
- When trying to create stored procedures from an SQL script, a `MySqlException` was thrown when attempting to redefine

the `DELIMITER`:

```
        MySql.Data.MySqlClient.MySqlException was unhandled
        Message="You have an error in your SQL syntax; check the manual that corresponds to your
        MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
        Source="MySql.Data"
        ErrorCode=-2147467259
        Number=1064
        StackTrace:
        à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
        à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
        lastInsertId)
        à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
        à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
      à MySql.Data.MySqlClient.MySqlScript.Execute()
```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug #46429)

- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. (Bug #41629)

D.3.4.5. Changes in MySQL Connector/Net 6.2.2 (22 December 2009, Generally Available)

First GA release of 6.2. This release fixes bugs since 6.2.1.

Bugs Fixed

- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. (Bug #48171)
- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. (Bug #48944)
- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be added. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

  This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. (Bug #48974)

- MySQL Connector/Net generated an invalid operation exception during a transaction rollback:

```
System.InvalidOperationException: Connection must be valid and open to rollback
transaction
   at MySql.Data.MySqlClient.MySqlTransaction.Rollback()
   at MySql.Data.MySqlClient.MySqlConnection.CloseFully()
   at
MySql.Data.MySqlClient.MySqlPromotableTransaction.System.Transactions.IPromotableSinglePhaseNotification.Rollback(S
singlePhaseEnlistment)
...
```

  (Bug #35330)

- Connection objects were not garbage collected when not in use. (Bug #31996)

D.3.4.6. Changes in MySQL Connector/Net 6.2.1 (16 November 2009, beta)

This release fixes bugs since 6.2.0.

Functionality Added or Changed

- The `MySqlParameter` class now has a property named `PossibleValues`. This property is NULL unless the parameter is created by `MySqlCommandBuilder.DeriveParameters`. Further, it will be NULL unless the parameter is of type enum or set - in this case it will be a list of strings that are the possible values for the column. This feature is designed as an aid to the developer. (Bug #48586)
- MySQL Connector/Net now supports the processing of certificates when connecting to an SSL-enabled MySQL Server. For further information see the connection string option SSL Mode in the section Section 21.2.6, “Connector/Net Connection String

Options Reference" and the tutorial Section 21.2.4.7, "Tutorial: Using SSL with MySQL Connector/Net".

- Starting with MySQL Connector/Net 6.2, there is a background job that runs every three minutes and removes connections from pool that have been idle (unused) for more than three minutes. The pool cleanup frees resources on both client and server side. This is because on the client side every connection uses a socket, and on the server side every connection uses a socket and a thread.

  Prior to this change, connections were never removed from the pool, and the pool always contained the peak number of open connections. For example, a web application that peaked at 1000 concurrent database connections would consume 1000 threads and 1000 open sockets at the server, without ever freeing up those resources from the connection pool.

- Prior to MySQL Connector/Net 6.2, `MySqlCommand.CommandTimeout` included user processing time, that is processing time not related to direct use of the connector. Timeout was implemented through a .NET Timer, that triggered after `CommandTimeout` seconds.

  MySQL Connector/Net 6.2 introduced timeouts that are aligned with how Microsoft handles `SqlCommand.CommandTimeout`. This property is the cumulative timeout for all network reads and writes during command execution or processing of the results. A timeout can still occur in the `MySqlReader.Read` method after the first row is returned, and does not include user processing time, only IO operations.

  Further details on this can be found in the relevant Microsoft documentation.

Bugs Fixed

- When building the `MySql.Data` project with .NET Framework 3.5 installed, the following build output was displayed:

```
Project file contains ToolsVersion="4.0", which is not supported by this version of
MSBuild. Treating the project as if it had ToolsVersion="3.5".
```

  The project had been created using the .NET Framework 4.0, which was beta, instead of using the 3.5 framework. (Bug #48271)

- When used, the `Encrypt` connection string option caused a "Keyword not supported" exception to be generated.

  This option is in fact obsolete, and the option SSL Mode should be used instead. Although the `Encrypt` option has been fixed so that it does not generate an exception, it will be removed completely in version 6.4. (Bug #48290)

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

```
        MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
```

  MySQL Connector/Net was changed so that it was possible to do:

```
        MySqlCommand clone = comm.Clone();
```

  (Bug #48460)

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BIGINT` was displayed as `BIGINT`. (Bug #47872)

- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

  MySQL Connector/Net was changed to expose the `MySqlDecimal` type, along with the supporting method `GetMySqlDecimal`. (Bug #48100)

- MySQL Connector/Net session support did not work with MySQL Server versions prior to 5.0, as the Session Provider used a call to `TIMESTAMPDIFF`, which was not available on servers prior to 5.0. (Bug #47219)

D.3.4.7. Changes in MySQL Connector/Net 6.2.0 (21 October 2009, alpha)

The first alpha release of 6.2.

Bugs Fixed

- When using a `BINARY(16)` column to represent a GUID and having specified “old guids = true” in the connection string, the values were returned correctly until a null value was encountered in that field. After the null value was encountered a format exception was thrown with the following message:

```
Guid should contain 32 digits with 4 dashes (xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx).
```

  (Bug #47928)

- The Session Provider created invalid “session expires” on a random basis.

  This was due to the fact that the Session Provider was incorrectly reading from the root `web.config`, rather than from the application specific `web.config`. (Bug #47815)

- When loading the `MySQLClient-mono.sln` file included with the Connector/Net source into Mono Develop, the following error occurred:

```
/home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):
Unsupported or unrecognized project:
'/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
```

  If the file was modified to remove this problem, then attempting to build the solution generated the following error:

```
/home/tbedford/connector-net-src/6.1/MySql.Data/Provider/Source/Connection.cs(280,46):
error CS0115: `MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory' is marked as an
override but no suitable property found to override
```

  (Bug #47048)

D.3.5. Changes in MySQL Connector/Net Version 6.1.x

D.3.5.1. Changes in MySQL Connector/Net 6.1.7 (Not released, Generally Available)

This release fixes bugs since 6.1.6.

Bugs Fixed

- `SchemaDefinition-5.5.ssdl` was modified to treat `CHAR(36)` columns as a GUID. (Bug #61657, Bug #12708208)
- `SqlFragment.QuoteIdentifier` was modified to add MySQL quotes around identifiers. (Bug #61635, Bug #12707285)
- `MySqlScript` was modified to enable correct processing of the `DELIMITER` command when not followed by a new line. (Bug #61680, Bug #12732279)
- The ASP.NET membership provider was modified to create and query all related tables using lowercase names. (Bug #61108, Bug #12702009)

D.3.5.2. Changes in MySQL Connector/Net 6.1.6 (Not released, Generally Available)

This release fixes bugs since 6.1.5.

Bugs Fixed

- `MySQLConnectionStringBuilder.ContainsKey()` incorrectly returned `false` when testing whether a keyword was part of the connection string. (Bug #11766671, Bug #59835)
- Modified `MySqlConnection.BeginTransaction` to throw a `NotSupportedException` for `Snapshot` isolation level. (Bug #61589, Bug #12698020)
- Modified `ProviderManifest.xml` to map `TIMESTAMP` database columns to the `DateTime` .NET type. (Bug #55351, Bug #12652602)
- MySQL Connector/Net generated an exception when executing a query consisting of ';', for example:

```
mycmd(";",mycon)
mycmd.executenonquery()
```

The exception generated was:

```
System.IndexOutOfRangeException: Index was outside the bounds of the array.
   at MySql.Data.MySqlClient.MySqlCommand.TrimSemicolons(String sql)
   at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
   at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
   at MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
```

(Bug #59537, Bug #11766433)

- A typed dataset did not get the table name. (Bug #57894, Bug #11764989)
- `MysqlDataReader.GetSchemaTable` returned incorrect values and types. (Bug #59989, Bug #11776346)
- Setting `Membership.ApplicationName` had no effect. (Bug #59438, Bug #11770465)
- All queries other than `INSERT` were executed individually instead of as a batch even though batching was enabled for the connection. (Bug #59616, Bug #11850286)
- The `MySqlTokenizer` contained unnecessary `Substring` and `Trim` calls:

  ```
  string token = sql.Substring(startIndex, stopIndex - startIndex).Trim();
  ```

  The variable `token` was not used anywhere in the code. (Bug #58757)
- `MembershipProvider` did not generate hashes correctly if the algorithm was keyed. The Key of the algorithm should have been set if the `HashAlgorithm` was `KeyedHashAlgorithm`. (Bug #58906)
- `MySqlCommand.ExecuteReader(CommandBehavior)` threw a `NullReferenceException` when being called with `CommandBehavior.CloseConnection`, if the SQL statement contained a syntax error, or contained invalid data such as an invalid column name. (Bug #58652)
- The ADO.NET Entity Data Model could not add stored procedures from MySQL Server 5.0.45 but worked fine using MySQL Server 5.1. (Bug #55349)
- Code introduced to fix bug #54863 proved problematic on .NET version 3.5 and above. (Bug #58853)
- `ReadFieldLength()` returned incorrect value for `BIGINT` autoincrement columns. (Bug #58373)
- MySQL Connector/Net did not support the `utf8mb4` character set. When attempting to connect to `utf8mb4` tables or columns, an exception `KeyNotFoundException` was generated. (Bug #58244)
- Default values returned for text columns were not quoted. This meant that the `COLUMN_DEFAULT` field of the `GetSchema` columns collection did not return a valid SQL expression. (Bug #56509)
- MySQL Connector/Net for .NET/Mono attempted to dynamically load the assembly `Mono.Posix.dll` when a Unix socket was used to connect to the server. This failed and the connector was not able to use a Unix socket unless the `Mono.Posix.dll` assembly was previously loaded by the program. (Bug #56410)
- Setting `MySqlCommand.CommandTimeout` to 0 had no effect. It should have resulted in an infinite timeout. (Bug #57265)
- When an output parameter was declared as type `MySqlDbType.Bit`, it failed to return with the correct value. (Bug #56756)
- When performing a row-by-row update, only the first row was updated and all other rows were ignored. (Bug #57092)
- Setting the `Default Command Timeout` connection string option had no effect. (Bug #56806)
- `MySqlHelper.ExecuteReader` did not include an overload accepting `MySqlParameter` objects when using a `MySqlConnection`. However, `MySqlHelper` did include an overload for `MySqlParameter` objects when using a string object containing the connection string to the database. (Bug #56755)
- Fixed Entity Framework provider `GROUP BY` clause generation by adding all group-by keys to the `SELECT` statement. (Bug #46742, Bug #12622129)

D.3.5.3. Changes in MySQL Connector/Net 6.1.5 (30 August 2010, Generally Available)

This release fixes bugs since 6.1.4.

Bugs Fixed

- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.

--OverflowException
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMySqlValue.ReadValue(MySqlPacket
packet, Int64 length, Boolean nullVal)
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
IMySqlValue valObject)
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

  (Bug #55644)

- The calculation of `lockAge` in the Session Provider sometimes generated a `System.Data.SqlTypes.SqlNullValueException`. (Bug #55701)

- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

```
Unable to load object with error: Object reference not
set to an instance of an object
```

  (Bug #55170)

- MySQL Connector/Net did not throw an `EndOfStreamException` exception when `net_write_timeout` was exceeded. (Bug #53439)

- The icon for the MySQL Web Configuration Tool was not displayed in Visual Studio for Web Application Projects. (Bug #54571)

- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. (Bug #54895)

- Several calls to `DataAdapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. (Bug #54863)

- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adapter.Update` either generated an exception or failed to batch the commands, executing each insert individually. (Bug #54386)

- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. (Bug #54570)

- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

  (Bug #53457)

- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
   MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
   Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
   Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
   Forecast.Page_Load(Object sender, EventArgs e) in ...:70
   System.Web.UI.Control.OnLoad(EventArgs e) +99
   System.Web.UI.Control.LoadRecursive() +50
   System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

  (Bug #53357)

- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. (Bug #54152, Bug #53865)
- In the ADO.NET Entity Data Model Wizard, the time to update a model scaled abnormally as the number of entities increased. (Bug #48791, Bug #12596237)
- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. (Bug #50671)
- EventLog was not disposed in the SessionState provider. (Bug #52550)
- The `INSERT` command was significantly slower with MySQL Connector/Net 6.x compared to 5.x, when compression was enabled. (Bug #48243)
- Membership schema creation failed if the default schema collation was not Latin1. (Bug #53174)
- `CHAR(36)` columns were not recognized as GUIDs when used in views with entity models. (Bug #52085)
- When an application was subjected to increased concurrent load, MySQL Connector/Net generated the following error when calling stored procedures:

  ```
  A DataTable named \'Procedure Parameters\'
  already belongs to this DataSet.
  ```

  (Bug #49118)
- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug #47153)
- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. (Bug #44715)
- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

  MySQL Connector/Net has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. (Bug #38411)
- Database name was emitted into typed datasets. This prevented users using the configured default database. (Bug #33870)

D.3.5.4. Changes in MySQL Connector/Net 6.1.4 (28 April 2010, Generally Available)

This release fixes bugs since 6.1.3.

Functionality Added or Changed

- Procedure caching had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

  MySQL Connector/Net has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. (Bug #52562)
- MySQL Connector/Net has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. (Bug #47467)

Bugs Fixed

- In MySQL Connector/Net, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. (Bug #52769)
- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. (Bug #52187)

- In MySQL Connector/Net, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

```
mapping.Add("latin1", new CharacterSet("latin1", 1));
```

  This meant that, for example, the Euro sign was not handled correctly.

  The correct mapping should have been:

```
mapping.Add("latin1", new CharacterSet("windows-1252", 1));
```

  This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. (Bug #51927)

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. (Bug #51788)
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. (Bug #49850)
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

```
Index and length must refer to a location within the string.
Parameter name: length
```

  (Bug #51610)

- Binary Columns were not displayed in the Query Builder of Visual Studio. (Bug #50171)
- `MySqlCommand.Parameters.Clear()` did not work. (Bug #50444)
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. (Bug #50123)
- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. (Bug #51149)
- When the `MySqlScript.execute()` method was called, the following exception was generated:

```
InvalidOperationException : The CommandText property has not been properly initialized.
```

  (Bug #50344)

- A `FormatException` was generated when an empty string was returned from a stored function. (Bug #49642)
- `MySqlDataReader.GetUInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. (Bug #49794)
- Calling a User Defined Function using Entity SQL in the Entity Framework caused a `NullReferenceException`. (Bug #45277)
- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. (Bug #48171)
- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. (Bug #48944)
- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be added. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

  This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. (Bug #48974)

- When trying to create stored procedures from an SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
        MySql.Data.MySqlClient.MySqlException was unhandled
        Message="You have an error in your SQL syntax; check the manual that corresponds to your
        MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
        Source="MySql.Data"
```

```
        ErrorCode=-2147467259
        Number=1064
        StackTrace:
        à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
        à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
        lastInsertId)
        à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
        à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
      à MySql.Data.MySqlClient.MySqlScript.Execute()
```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug #46429)

- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. (Bug #41629)

D.3.5.5. Changes in MySQL Connector/Net 6.1.3 (16 November 2009, Generally Available)

This release fixes bugs since 6.1.2.

Bugs Fixed

- When building the `MySql.Data` project with .NET Framework 3.5 installed, the following build output was displayed:

```
Project file contains ToolsVersion="4.0", which is not supported by this version of
MSBuild. Treating the project as if it had ToolsVersion="3.5".
```

The project had been created using the .NET Framework 4.0, which was beta, instead of using the 3.5 framework. (Bug #48271)

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

```
        MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
```

MySQL Connector/Net was changed so that it was possible to do:

```
        MySqlCommand clone = comm.Clone();
```

(Bug #48460)

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BIGINT` was displayed as `BIGINT`. (Bug #47872)

- For some character sets such as UTF-8, a `CHAR` column would sometimes be incorrectly interpreted as a `GUID` by MySQL Connector/Net.

  MySQL Connector/Net was changed so that a column would only be interpreted as a `GUID` if it had a character length of 36, as opposed to a byte length of 36. (Bug #47985)

- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

  MySQL Connector/Net was changed to expose the `MySqlDecimal` type, along with the supporting method `GetMySqlDecimal`. (Bug #48100)

- If `MySqlConnection.GetSchema` was called for "Indexes" on a table named “b`a`d” as follows:

```
DataTable schemaPrimaryKeys = connection.GetSchema(
  "Indexes",
  new string[] { null, schemaName, "b`a`d"});
```

Then the following exception was generated:

```
You have an error in your SQL syntax; check the manual that corresponds to
your MySQL server version for the right syntax to use near 'a`d`' at line 1
```

(Bug #48101)

- When using a `BINARY(16)` column to represent a GUID and having specified “old guids = true” in the connection string, the values were returned correctly until a null value was encountered in that field. After the null value was encountered a format exception was thrown with the following message:

```
Guid should contain 32 digits with 4 dashes (xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx).
```

(Bug #47928)

- The Session Provider created invalid “session expires” on a random basis.

  This was due to the fact that the Session Provider was incorrectly reading from the root `web.config`, rather than from the application specific `web.config`. (Bug #47815)

- Attempting to build MySQL Connector/Net 6.1 `MySQL.Data` from source code on Windows failed with the following error:

```
...\clones\6.1\MySql.Data\Provider\Source\NativeDriver.cs(519,29): error CS0122:
'MySql.Data.MySqlClient.MySqlPacket.MySqlPacket()' is inaccessible due to its protection level
```

(Bug #47354)

- When tables were auto created for the Session State Provider they were set to use the MySQL Server's default collation, rather than the default collation set for the containing database. (Bug #47332)

- When loading the `MySQLClient-mono.sln` file included with the Connector/Net source into Mono Develop, the following error occurred:

```
/home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):
Unsupported or unrecognized project:
'/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
```

  If the file was modified to remove this problem, then attempting to build the solution generated the following error:

```
/home/tbedford/connector-net-src/6.1/MySql.Data/Provider/Source/Connection.cs(280,46):
error CS0115: `MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory' is marked as an
override but no suitable property found to override
```

(Bug #47048)

D.3.5.6. Changes in MySQL Connector/Net 6.1.2 (08 September 2009, Generally Available)

This is the first GA release of 6.1. This release fixes bugs since 6.1.1.

Bugs Fixed

- The MySQL Connector/Net Session State Provider truncated session data to 64KB, due to its column types being set to `BLOB`. (Bug #47339)

- MySQL Connector/Net generated the following exception when using the Session State provider:

```
You have an error in your SQL syntax; check the manual that corresponds to your MySQL
server version for the right syntax to use near 'MINUTEWHERE SessionId =
'dtmgga55x35oi255nrfrxe45' AND ApplicationId = 1 AND Loc' at line 1
Description: An unhandled exception occurred during the execution of the current web
request. Please review the stack trace for more information about the error and where it
originated in the code.

Exception Details: MySql.Data.MySqlClient.MySqlException: You have an error in your SQL
syntax; check the manual that corresponds to your MySQL server version for the right
syntax to use near 'MINUTEWHERE SessionId = 'dtmgga55x35oi255nrfrxe45' AND ApplicationId =
1 AND Loc' at line 1
```

(Bug #46939)

- If an error occurred during connection to a MySQL Server, deserializing the error message from the packet buffer caused a `NullReferenceException` to be thrown. When the method `MySqlPacket::ReadString()` attempted to retrieve the error message, the following line of code threw the exception:

```
        string s = encoding.GetString(bits, (int)buffer.Position, end - (int)buffer.Position);
```

```
```

This was due to the fact that the encoding field had not been initialized correctly. (Bug #46844)

- Input parameters were missing from Stored Procedures when using them with ADO.NET Data Entities. (Bug #44985)
- MySQL Connector/Net did not time out correctly. The command timeout was set to 30 secs, but MySQL Connector/Net hung for several hours. (Bug #43761)

D.3.5.7. Changes in MySQL Connector/Net 6.1.1 (20 August 2009, beta)

This is the first Beta release of 6.1.

Bugs Fixed

- In the `MySqlDataReader` class the `GetSByte` function returned a `byte` value instead of an `sbyte` value. (Bug #46620)
- An exception was generated when using `TIMESTAMP` columns with the Entity Framework. (Bug #46311)
- Insert into two tables failed when using the Entity Framework. The exception generated was:

```
        The value given is not an instance of type 'Edm.Int32'
```

(Bug #45077)

- Conversion of MySQL `TINYINT(1)` to `boolean` failed. (Bug #46205, Bug #46359, Bug #41953)
- Calling the Entity Framework `SaveChanges()` method of any MySQL ORM Entity with a column type `TIME`, generated an error message:

```
Unknown PrimitiveKind Time
```

(Bug #45457)

- The Entity Framework provider was not calling `DBSortExpression` correctly when the `Skip` and `Take` methods were used, such as in the following statement:

```
        TestModel.tblquarantine.OrderByDescending(q => q.MsgDate).Skip(100).Take(100).ToList();
```

This resulted in the data being unsorted. (Bug #45723)

- MySQL Connector/Net sometimes hung, without generating an exception. This happened if a read from a stream failed returning a 0, causing the code in `LoadPacket()` to enter an infinite loop. (Bug #46308)
- The MySQL Connector/Net Profile Provider, `MySql.Web.Profile.MySQLProfileProvider`, generated an error when running on Mono. When an attempt was made to save a string in `Profile.Name` the string was not saved to the `my_aspnet_Profiles` table. If an attempt was made to force the save with `Profile.Save()` the following error was generated:

```
        Server Error in '/mono' Application

        --------------------------------------------------------------------------------

        The requested feature is not implemented.
        Description: HTTP 500. Error processing request.

        Stack Trace:

        Version information: Mono Version: 2.0.50727.1433; ASP.NET Version: 2.0.50727.1433
```

(Bug #46375)

- When populating a MySQL database table in Visual Studio using the Table Editor, if a `VARCHAR(10)` column was changed to a `VARCHAR(20)` column an exception was generated:

```
  SystemArgumentException: DataGridViewComboBoxCell value is not valid.
To replace this default dialog please handle the DataError Event.
```

(Bug #46100)

- The MySQL Connector/Net 6.0.4 installer failed with an error. The error message generated was:

```
There is a problem with this Windows Installer package. A DLL required for this
install to complete could not be run. Contact your support personnel or package vendor.
```

When OK was clicked to acknowledge the error the installer exited. (Bug #45474)

- When using MySQL Connector/Net 6.0.4 and a MySQL Server 4.1 an exception was generated when trying to execute:

```
connection.GetSchema("Columns", ...);
```

The exception generated was:

```
'connection.GetSchema("Columns")' threw an exception of type
'System.ArgumentException'System.Data.DataTable {System.ArgumentException}
base{"Input string was not in a correct format.Couldn't store <'Select'> in
NUMERIC_PRECISION Column.  Expected type is UInt64."}System.Exception
{System.ArgumentException}
```

(Bug #46270)

- The MySQL Connector/Net method `StoredProcedure.GetParameters(string)` ignored the programmer's setting of the `UseProcedureBodies` option. This broke any application for which the application's parameter names did not match the parameter names in the Stored Procedure, resulting in an `ArgumentException` with the message “Parameter 'foo' not found in the collection.” and the following stack trace:

```
MySql.Data.dll!MySql.Data.MySqlClient.MySqlParameterCollection.GetParameterFlexible(stri
ng parameterName = "pStart", bool throwOnNotFound = true) Line 459C#
MySql.Data.dll!MySql.Data.MySqlClient.StoredProcedure.Resolve() Line 157 + 0x25
bytesC#

System.Data.dll!System.Data.Common.DbDataAdapter.Fill(System.Data.DataSet dataSet) +
0x5f bytes
```

(Bug #46213)

- Errors occurred when using the Entity Framework with cultures that used a comma as the decimal separator. This was because the formatting for `SINGLE`, `DOUBLE` and `DECIMAL` values was not handled correctly. (Bug #44455)

- When reading data, such as with a `MySqlDataAdapter` on a `MySqlConnection`, MySQL Connector/Net could potentially enter an infinite loop in `CompressedStream.ReadNextpacket()` if compression was enabled. (Bug #43678)

- When attempting to connect to MySQL using the Compact Framework version of MySQL Connector/Net, an `IndexOutOfRangeException` exception was generated on trying to open the connection. (Bug #43736)

- In the case of long network inactivity, especially when connection pooling was used, connections were sometimes dropped, for example, by firewalls.

  Note: The bugfix introduced a new `keepalive` parameter, which prevents disconnects by sending an empty TCP packet after

a specified timeout. (Bug #40684)

- MySQL Connector/Net CHM documentation stated that MySQL Server 3.23 was supported. (Bug #42110)
- An error occurred when building MySQL Connector/Net from source code checked out from the public SVN repository. This happened on Linux using Mono and Nant. The Mono JIT compiler version was 1.2.6.0. The Nant version was 0.85.

  When an attempt was made to build (for example) the MySQL Connector/Net 5.2 branch using the command:

  ```
  $ nant -buildfile:Client.build
  ```

  The following error occurred:

  ```
  BUILD FAILED

  Error loading buildfile.
  Encoding name 'Windows-1252' not supported.
  Parameter name: name
  ```

  (Bug #42411)
- Calling a Stored Procedure with an output parameter through MySQL Connector/Net resulted in a memory leak. Calling the same Stored Procedure without an output parameter did not result in a memory leak. (Bug #36027)

D.3.5.8. Changes in MySQL Connector/Net 6.1.0 (15 July 2009, alpha)

This is the first Alpha release of 6.1.

Functionality Added or Changed

- Website Configuration Dialog - This is a new wizard that is activated by clicking a button on the toolbar at the top of the Visual Studio Solution Explorer. It works in conjunction with the ASP.Net administration pages, making it easier to activate and set advanced options for the different MySQL web providers included.
- Session State Provider - This enables you to store the state of your website in a MySQL server.
- Support for native output parameters - This is supported when connected to a server that supports native output parameters. This includes servers as of 5.5.3 and 6.0.8.
- Changed GUID type - The backend representation of a guid type has been changed to be CHAR(36). This is so you can use the server UUID() function to populate a GUID table. UUID generates a 36 character string. Developers of older applications can add `old guids=true` to the connection string and the old BINARY(16) type will be used instead.

D.3.6. Changes in MySQL Connector/Net Version 6.0.x

D.3.6.1. Changes in MySQL Connector/Net 6.0.8 (Not released)

Fixes bugs since 6.0.7.

Bugs Fixed

- `MySQLConnectionStringBuilder.ContainsKey()` incorrectly returned `false` when testing whether a keyword was part of the connection string. (Bug #11766671, Bug #59835)
- MySQL Connector/Net generated an exception when executing a query consisting of ';', for example:

  ```
  mycmd(";",mycon)
  mycmd.executenonquery()
  ```

  The exception generated was:

  ```
  System.IndexOutOfRangeException: Index was outside the bounds of the array.
     at MySql.Data.MySqlClient.MySqlCommand.TrimSemicolons(String sql)
     at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
     at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
     at MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
  ```

(Bug #59537, Bug #11766433)

- A typed dataset did not get the table name. (Bug #57894, Bug #11764989)
- `MysqlDataReader.GetSchemaTable` returned incorrect values and types. (Bug #59989, Bug #11776346)
- Setting `Membership.ApplicationName` had no effect. (Bug #59438, Bug #11770465)
- All queries other than `INSERT` were executed individually instead of as a batch even though batching was enabled for the connection. (Bug #59616, Bug #11850286)
- The `MySqlTokenizer` contained unnecessary `Substring` and `Trim` calls:

```
string token = sql.Substring(startIndex, stopIndex - startIndex).Trim();
```

  The variable `token` was not used anywhere in the code. (Bug #58757)

- `MembershipProvider` did not generate hashes correctly if the algorithm was keyed. The Key of the algorithm should have been set if the `HashAlgorithm` was `KeyedHashAlgorithm`. (Bug #58906)
- `MySqlCommand.ExecuteReader(CommandBehavior)` threw a `NullReferenceException` when being called with `CommandBehavior.CloseConnection`, if the SQL statement contained a syntax error, or contained invalid data such as an invalid column name. (Bug #58652)
- The ADO.NET Entity Data Model could not add stored procedures from MySQL Server 5.0.45 but worked fine using MySQL Server 5.1. (Bug #55349)
- Code introduced to fix bug #54863 proved problematic on .NET version 3.5 and above. (Bug #58853)
- `ReadFieldLength()` returned incorrect value for `BIGINT` autoincrement columns. (Bug #58373)
- MySQL Connector/Net did not support the `utf8mb4` character set. When attempting to connect to `utf8mb4` tables or columns, an exception `KeyNotFoundException` was generated. (Bug #58244)
- Default values returned for text columns were not quoted. This meant that the `COLUMN_DEFAULT` field of the `GetSchema` columns collection did not return a valid SQL expression. (Bug #56509)
- MySQL Connector/Net for .NET/Mono attempted to dynamically load the assembly `Mono.Posix.dll` when a Unix socket was used to connect to the server. This failed and the connector was not able to use a Unix socket unless the `Mono.Posix.dll` assembly was previously loaded by the program. (Bug #56410)
- Setting `MySqlCommand.CommandTimeout` to 0 had no effect. It should have resulted in an infinite timeout. (Bug #57265)
- When an output parameter was declared as type `MySqlDbType.Bit`, it failed to return with the correct value. (Bug #56756)
- When performing a row-by-row update, only the first row was updated and all other rows were ignored. (Bug #57092)
- Setting the `Default Command Timeout` connection string option had no effect. (Bug #56806)

D.3.6.2. Changes in MySQL Connector/Net 6.0.7 (30 August 2010)

Fixes bugs since 6.0.6.

Bugs Fixed

- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.

--OverflowException
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMySqlValue.ReadValue(MySqlPacket
packet, Int64 length, Boolean nullVal)
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
IMySqlValue valObject)
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

(Bug #55644)

- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. (Bug #54895)
- Several calls to `DataAdapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. (Bug #54863)
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adapter.Update` either generated an exception or failed to batch the commands, executing each insert individually. (Bug #54386)
- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. (Bug #54570)
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

(Bug #53457)

- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
   MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
   Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
   Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
   Forecast.Page_Load(Object sender, EventArgs e) in ...:70
   System.Web.UI.Control.OnLoad(EventArgs e) +99
   System.Web.UI.Control.LoadRecursive() +50
   System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

(Bug #53357)

- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. (Bug #54152, Bug #53865)
- In the ADO.NET Entity Data Model Wizard, the time to update a model scaled abnormally as the number of entities increased. (Bug #48791, Bug #12596237)
- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. (Bug #50671)
- EventLog was not disposed in the SessionState provider. (Bug #52550)
- The `INSERT` command was significantly slower with MySQL Connector/Net 6.x compared to 5.x, when compression was enabled. (Bug #48243)
- Membership schema creation failed if the default schema collation was not Latin1. (Bug #53174)
- When an application was subjected to increased concurrent load, MySQL Connector/Net generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\'
already belongs to this DataSet.
```

(Bug #49118)

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug #47153)

- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. (Bug #44715)
- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

  MySQL Connector/Net has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. (Bug #38411)
- Database name was emitted into typed datasets. This prevented users using the configured default database. (Bug #33870)

D.3.6.3. Changes in MySQL Connector/Net 6.0.6 (28 April 2010)

Fixes bugs since 6.0.5.

Functionality Added or Changed

- Procedure caching had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

  MySQL Connector/Net has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. (Bug #52562)
- MySQL Connector/Net has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. (Bug #47467)

Bugs Fixed

- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

  ```
  Unable to load object with error: Object reference not
  set to an instance of an object
  ```

  (Bug #55170)
- In MySQL Connector/Net, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. (Bug #52769)
- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. (Bug #52187)
- In MySQL Connector/Net, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

  ```
  mapping.Add("latin1", new CharacterSet("latin1", 1));
  ```

  This meant that, for example, the Euro sign was not handled correctly.

  The correct mapping should have been:

  ```
  mapping.Add("latin1", new CharacterSet("windows-1252", 1));
  ```

  This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. (Bug #51927)
- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. (Bug #51788)
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. (Bug #49850)
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

  ```
  Index and length must refer to a location within the string.
  Parameter name: length
  ```

(Bug #51610)

- Binary Columns were not displayed in the Query Builder of Visual Studio. (Bug #50171)
- `MySqlCommand.Parameters.Clear()` did not work. (Bug #50444)
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. (Bug #50123)
- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. (Bug #51149)
- When the `MySqlScript.execute()` method was called, the following exception was generated:

```
InvalidOperationException : The CommandText property has not been properly initialized.
```

(Bug #50344)

- A `FormatException` was generated when an empty string was returned from a stored function. (Bug #49642)
- `MySqlDataReader.GetUInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. (Bug #49794)
- Calling a User Defined Function using Entity SQL in the Entity Framework caused a `NullReferenceException`. (Bug #45277)
- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. (Bug #48171)
- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. (Bug #48944)
- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be added. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. (Bug #48974)

- When trying to create stored procedures from an SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
        MySql.Data.MySqlClient.MySqlException was unhandled
        Message="You have an error in your SQL syntax; check the manual that corresponds to your
        MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
        Source="MySql.Data"
        ErrorCode=-2147467259
        Number=1064
        StackTrace:
        à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
        à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
        lastInsertId)
        à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
        à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
      à MySql.Data.MySqlClient.MySqlScript.Execute()
```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug #46429)

- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. (Bug #41629)

D.3.6.4. Changes in MySQL Connector/Net 6.0.5 (12 November 2009)

This is a new release, fixing recently discovered bugs.

Bugs Fixed

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

```
        MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
```

  MySQL Connector/Net was changed so that it was possible to do:

```
        MySqlCommand clone = comm.Clone();
```

  (Bug #48460)

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BIGINT` was displayed as `BIGINT`. (Bug #47872)

- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

  MySQL Connector/Net was changed to expose the `MySqlDecimal` type, along with the supporting method `GetMySqlDecimal`. (Bug #48100)

- If `MySqlConnection.GetSchema` was called for "Indexes" on a table named “b`a`d” as follows:

```
DataTable schemaPrimaryKeys = connection.GetSchema(
  "Indexes",
  new string[] { null, schemaName, "b`a`d"});
```

  Then the following exception was generated:

```
You have an error in your SQL syntax; check the manual that corresponds to
your MySQL server version for the right syntax to use near 'a`d`' at line 1
```

  (Bug #48101)

- When loading the `MySQLClient-mono.sln` file included with the Connector/Net source into Mono Develop, the following error occurred:

```
/home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):
Unsupported or unrecognized project:
'/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
```

  If the file was modified to remove this problem, then attempting to build the solution generated the following error:

```
/home/tbedford/connector-net-src/6.1/MySql.Data/Provider/Source/Connection.cs(280,46):
error CS0115: `MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory' is marked as an
override but no suitable property found to override
```

  (Bug #47048)

- If an error occurred during connection to a MySQL Server, deserializing the error message from the packet buffer caused a `NullReferenceException` to be thrown. When the method `MySqlPacket::ReadString()` attempted to retrieve the error message, the following line of code threw the exception:

```
        string s = encoding.GetString(bits, (int)buffer.Position, end - (int)buffer.Position);
```

  This was due to the fact that the encoding field had not been initialized correctly. (Bug #46844)

- In the `MySqlDataReader` class the `GetSByte` function returned a `byte` value instead of an `sbyte` value. (Bug #46620)

- An exception was generated when using `TIMESTAMP` columns with the Entity Framework. (Bug #46311)

- Insert into two tables failed when using the Entity Framework. The exception generated was:

```
        The value given is not an instance of type 'Edm.Int32'
```

  (Bug #45077)

- Conversion of MySQL `TINYINT(1)` to `boolean` failed. (Bug #46205, Bug #46359, Bug #41953)

- Calling the Entity Framework `SaveChanges()` method of any MySQL ORM Entity with a column type `TIME`, generated an error message:

```
Unknown PrimitiveKind Time
```

  (Bug #45457)

- The Entity Framework provider was not calling `DBSortExpression` correctly when the `Skip` and `Take` methods were used, such as in the following statement:

```
        TestModel.tblquarantine.OrderByDescending(q => q.MsgDate).Skip(100).Take(100).ToList();
```

  This resulted in the data being unsorted. (Bug #45723)

- MySQL Connector/Net sometimes hung, without generating an exception. This happened if a read from a stream failed returning a 0, causing the code in `LoadPacket()` to enter an infinite loop. (Bug #46308)

- The MySQL Connector/Net Profile Provider, `MySql.Web.Profile.MySQLProfileProvider`, generated an error when running on Mono. When an attempt was made to save a string in `Profile.Name` the string was not saved to the `my_aspnet_Profiles` table. If an attempt was made to force the save with `Profile.Save()` the following error was generated:

```
        Server Error in '/mono' Application

        --------------------------------------------------------------------------------

        The requested feature is not implemented.
        Description: HTTP 500. Error processing request.

        Stack Trace:

        Version information: Mono Version: 2.0.50727.1433; ASP.NET Version: 2.0.50727.1433
```

  (Bug #46375)

- When populating a MySQL database table in Visual Studio using the Table Editor, if a `VARCHAR(10)` column was changed to a `VARCHAR(20)` column an exception was generated:

```
        SystemArgumentException: DataGridViewComboBoxCell value is not valid.
      To replace this default dialog please handle the DataError Event.
```

  (Bug #46100)

- The MySQL Connector/Net 6.0.4 installer failed with an error. The error message generated was:

```
        There is a problem with this Windows Installer package. A DLL required for this
        install to complete could not be run. Contact your support personnel or package vendor.
```

  When OK was clicked to acknowledge the error the installer exited. (Bug #45474)

- When using MySQL Connector/Net 6.0.4 and a MySQL Server 4.1 an exception was generated when trying to execute:

```
        connection.GetSchema("Columns", ...);
```

  The exception generated was:

```
        'connection.GetSchema("Columns")' threw an exception of type
        'System.ArgumentException'System.Data.DataTable {System.ArgumentException}
        base{"Input string was not in a correct format.Couldn't store <'Select'> in
        NUMERIC_PRECISION Column.  Expected type is UInt64."}System.Exception
        {System.ArgumentException}
```

(Bug #46270)

- The MySQL Connector/Net method `StoredProcedure.GetParameters(string)` ignored the programmer's setting of the `UseProcedureBodies` option. This broke any application for which the application's parameter names did not match the parameter names in the Stored Procedure, resulting in an `ArgumentException` with the message “Parameter 'foo' not found in the collection.” and the following stack trace:

```
        MySql.Data.dll!MySql.Data.MySqlClient.MySqlParameterCollection.GetParameterFlexible(stri
        ng parameterName = "pStart", bool throwOnNotFound = true) Line 459C#

        dataset = {System.Data.DataSet}, System.Data.DataTable[] datatables = null, int
        startRecord = 0, int maxRecords = 0, string srcTable = "Table", System.Data.IDbCommand
        command = {MySql.Data.MySqlClient.MySqlCommand}, System.Data.CommandBehavior behavior) +
        0x83 bytes
        System.Data.dll!System.Data.Common.DbDataAdapter.Fill(System.Data.DataSet dataSet, int
        startRecord, int maxRecords, string srcTable, System.Data.IDbCommand command,
        System.Data.CommandBehavior behavior) + 0x120 bytes
        System.Data.dll!System.Data.Common.DbDataAdapter.Fill(System.Data.DataSet dataSet) +
        0x5f bytes
```

(Bug #46213)

- The `EscapeString` code carried out escaping by calling `string.Replace` multiple times. This resulted in a performance bottleneck, as for every line a new string was allocated and another was disposed of by the garbage collector. (Bug #45699)

- In MySQL Connector/Net 6.0.4 using `GetProcData` generated an error because the `parameters` data table was only created if MySQL Server was at least version 6.0.6, or if the `UseProcedureBodies` connection string option was set to true.

  Also the `DeriveParameters` command generated a null reference exception. This was because the `parameters` data table, which was null, was used in a `for each` loop. (Bug #45952)

- Adding the `Allow Batch=False` option to the connection string caused MySQL Connector/Net to generate the error:

```
You have an error in your SQL syntax; check the manual that corresponds to your MySQL
      server version for the right syntax to use near 'SET character_set_results=NULL' at line 1
```

(Bug #45502)

- A MySQL Connector/Net test program that connected to MySQL Server using the connection string option `compress=true` crashed, but only when running on Mono. The program worked as expected when running on Microsoft Windows.

  This was due to a bug in Mono. MySQL Connector/Net was modified to avoid using `WeakReferences` in the `Compressed` stream class, which was causing the crash. (Bug #45463)

- Input parameters were missing from Stored Procedures when using them with ADO.NET Data Entities. (Bug #44985)

- Errors occurred when using the Entity Framework with cultures that used a comma as the decimal separator. This was because the formatting for `SINGLE`, `DOUBLE` and `DECIMAL` values was not handled correctly. (Bug #44455)

- When reading data, such as with a `MySqlDataAdapter` on a `MySqlConnection`, MySQL Connector/Net could potentially enter an infinite loop in `CompressedStream.ReadNextpacket()` if compression was enabled. (Bug #43678)

- When attempting to connect to MySQL using the Compact Framework version of MySQL Connector/Net, an `IndexOutOfRangeException` exception was generated on trying to open the connection. (Bug #43736)

- In the case of long network inactivity, especially when connection pooling was used, connections were sometimes dropped, for example, by firewalls.

  Note: The bugfix introduced a new `keepalive` parameter, which prevents disconnects by sending an empty TCP packet after a specified timeout. (Bug #40684)

- MySQL Connector/Net CHM documentation stated that MySQL Server 3.23 was supported. (Bug #42110)

- An error occurred when building MySQL Connector/Net from source code checked out from the public SVN repository. This happened on Linux using Mono and Nant. The Mono JIT compiler version was 1.2.6.0. The Nant version was 0.85.

When an attempt was made to build (for example) the MySQL Connector/Net 5.2 branch using the command:

```
        $ nant -buildfile:Client.build
```

The following error occurred:

```
        BUILD FAILED

        Error loading buildfile.
        Encoding name 'Windows-1252' not supported.
        Parameter name: name
```

(Bug #42411)

- MySQL Connector/Net generated the following exception:

```
System.NullReferenceException: Object reference not set to an instance of an object.
      bei MySql.Data.MySqlClient.MySqlCommand.TimeoutExpired(Object commandObject)
      bei System.Threading._TimerCallback.TimerCallback_Context(Object state)
      bei System.Threading.ExecutionContext.runTryCode(Object userData)
      bei
      System.Runtime.CompilerServices.RuntimeHelpers.ExecuteCodeWithGuaranteedCleanup(TryCode
      code, CleanupCode backoutCode, Object userData)
      bei System.Threading.ExecutionContext.RunInternal(ExecutionContext executionContext,
      ContextCallback callback, Object state)
      bei System.Threading.ExecutionContext.Run(ExecutionContext executionContext,
      ContextCallback callback, Object state)
      bei System.Threading._TimerCallback.PerformTimerCallback(Object state)
```

(Bug #40005)

- After a Reference to "C:\Program Files\MySQL\MySQL Connector Net 5.2.4\Compact Framework\MySql.Data.CF.dll" was added to a Windows Mobile 5.0 project, the project then failed to build, generating a Microsoft Visual C# compiler error.

  The error generated was:

```
Error 2 The type 'System.Runtime.CompilerServices.CompilerGeneratedAttribute'
      has no constructors defined MysqlTest
      Error 3 Internal Compiler Error (0xc0000005 at address 5A7E3714):
      likely culprit is 'COMPILE'.
```

(Bug #42261)

- Using a `DataAdapter` with a linked `MySqlCommandBuilder` the following exception was thrown when trying to call `da.Update(DataRow[] rows)`:

```
Connection must be valid and open
```

(Bug #34657)

- Calling a Stored Procedure with an output parameter through MySQL Connector/Net resulted in a memory leak. Calling the same Stored Procedure without an output parameter did not result in a memory leak. (Bug #36027)

D.3.6.5. Changes in MySQL Connector/Net 6.0.4 (16 June 2009)

This is the first post-GA release, fixing recently discovered bugs.

Bugs Fixed

- If a certain socket exception occurred when trying to establish a MySQL database connection, MySQL Connector/Net displayed an exception message that appeared to be unrelated to the underlying problem. This masked the problem and made diagnosing problems more difficult.

  For example, if, when establishing a database connection using TCP/IP, Windows on the local machine allocated an ephemeral port that conflicted with a socket address still in use, then Windows/.NET would throw a socket exception with the following error text:

```
Only one usage of each socket address (protocol/network address/port) is normally
      permitted IP ADDRESS/PORT.
```

However, MySQL Connector/Net masked this socket exception and displayed an exception with the following text:

```
Unable to connect to any of the specified MySQL hosts.
```

(Bug #45021)

- The Data Set editor generated an error when attempts were made to modify insert, update or delete commands:

```
Error in WHERE clause near '@'.
      Unable to parse query text.
```

(Bug #44512)

- MySQL Connector/Net was missing the capability to validate the server's certificate when using encryption. This made it possible to conduct a man-in-the-middle attack against the connection, which defeated the security provided by SSL. (Bug #38700)
- A SQL query string containing an escaped backslash caused an exception to be generated:

```
Index and length must refer to a location within the string.
      Parameter name: length
      at System.String.InternalSubStringWithChecks(Int32 startIndex, Int32 length, Boolean
      fAlwaysCopy)
      at MySql.Data.MySqlClient.MySqlTokenizer.NextParameter()
      at MySql.Data.MySqlClient.Statement.InternalBindParameters(String sql,
      MySqlParameterCollection parameters, MySqlPacket packet)
      at MySql.Data.MySqlClient.Statement.BindParameters()
      at MySql.Data.MySqlClient.PreparableStatement.Execute()
      at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior be□havior)
      at MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
```

(Bug #44960)

- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it was not possible to build MySQL Connector/Net from source. (Bug #44822)
- When creating a new DataSet the following error was generated:

```
Failed to open a connection to database.
      Cannot load type with name 'MySQL.Data.VisualStudio.StoredProcedureColumnEnumerator'
```

(Bug #44460)

- The DataReader in MySQL Connector/Net 6.0.3 considered a BINARY(16) field as a GUID with a length of 16. (Bug #44507)
- The MySQL Connector/Net MySQLRoleProvider reported that there were no roles, even when roles existed. (Bug #44414)

D.3.6.6. Changes in MySQL Connector/Net 6.0.3 (28 April 2009)

First GA release.

Functionality Added or Changed

- The `MySqlTokenizer` failed to split fieldnames from values if they were not separated by a space. This also happened if the string contained certain characters. As a result `MySqlCommand.ExecuteNonQuery` raised an index out of range exception.

  The resulting errors are illustrated by the following examples. Note, the example statements do not have delimiting spaces around the `=` operator.

```
INSERT INTO anytable SET Text='test--test';
```

  The tokenizer incorrectly interpreted the value as containing a comment.

```
UPDATE anytable SET Project='123-456',Text='Can you explain this ?',Duration=15 WHERE
      ID=4711;'
```

  A `MySqlException` was generated, as the `?` in the value was interpreted by the tokenizer as a parameter sign. The error message generated was:

```
Fatal error encountered during command execution.
      EXCEPTION: MySqlException - Parameter '?'' must be defined.
```

(Bug #44318)

Bugs Fixed

- Column types for `SchemaProvider` and `ISSchemaProvider` did not match.

  When the source code in `SchemaProvider.cs` and `ISSchemaProvider.cs` were compared it was apparent that they were not using the same column types. The base provider used SQL such as `SHOW CREATE TABLE`, while `ISSchemaProvider` used the schema information tables. Column types used by the base class were `INT64` and the column types used by `ISSchemaProvider` were `UNSIGNED`. (Bug #44123)

- `MySQL.Data` was not displayed as a Reference inside Microsoft Visual Studio 2008 Professional.

  When a new C# project was created in Microsoft Visual Studio 2008 Professional, `MySQL.Data` was not displayed when REFERENCES, ADD REFERENCE was selected. (Bug #44141)

D.3.6.7. Changes in MySQL Connector/Net 6.0.2 (07 April 2009, beta)

This is a new development release, fixing recently discovered bugs.

Bugs Fixed

- MySQL Connector/Net 6.0.1 did not load in Microsoft Visual Studio 2008 and Visual Studio 2005 Pro.

  The following error message was generated:

```
.NET Framework Data Provider for MySQL: The data provider object factory service was not
      found.
```

  (Bug #44064)

D.3.6.8. Changes in MySQL Connector/Net 6.0.1 (02 April 2009, beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs Fixed

- Generating an Entity Data Model (EDM) schema with a table containing columns with data types `MEDIUMTEXT` and `LONGTEXT` generated a runtime error message “Max value too long or too short for Int32”. (Bug #43480)
- An insert and update error was generated by the decimal data type in the Entity Framework, when a German collation was used. (Bug #43574)

D.3.6.9. Changes in MySQL Connector/Net 6.0.0 (02 March 2009, alpha)

This is a new Alpha development release.

Bugs Fixed

- A null reference exception was generated when `MySqlConnection.ClearPool(connection)` was called. (Bug #42801)

D.3.7. Changes in MySQL Connector/Net Version 5.3.x

D.3.7.1. Changes in MySQL Connector/Net 5.3.0 (Not released)

Bugs Fixed

- The MySQL Connector/Net installer program ended prematurely without reporting the specific error. (Bug #39019)

- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerates-chema="true"`. (Bug #39072)
- When called with an incorrect password the `MembershipProvider.GetPassword()` method threw a `MySQLExcep-tion` instead of a `MembershipPasswordException` . (Bug #38939)
- Possible overflow in `MySqlPacket.ReadLong()`. (Bug #36997)
- The `TokenizeSql` method was adding query overhead and causing high CPU utilization for larger queries. (Bug #36836)

D.3.8. Changes in MySQL Connector/Net Version 5.2.x

D.3.8.1. Changes in MySQL Connector/Net 5.2.8 (Not released)

Bugs Fixed

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug #47153)
- If `MySqlConnection.GetSchema` was called for "Indexes" on a table named “b`a`d” as follows:

```
DataTable schemaPrimaryKeys = connection.GetSchema(
  "Indexes",
  new string[] { null, schemaName, "b`a`d"});
```

Then the following exception was generated:

```
You have an error in your SQL syntax; check the manual that corresponds to
your MySQL server version for the right syntax to use near 'a`d`' at line 1
```

(Bug #48101)

- If the application slept for longer than the specified `net_write_timeout`, and then resumed `Read` operations on a connection, then the application failed silently. (Bug #45978)
- In the `MySqlDataReader` class the `GetSByte` function returned a `byte` value instead of an `sbyte` value. (Bug #46620)
- Conversion of MySQL `TINYINT(1)` to `boolean` failed. (Bug #46205, Bug #46359, Bug #41953)
- The MySQL Connector/Net Profile Provider, `MySql.Web.Profile.MySQLProfileProvider`, generated an error when running on Mono. When an attempt was made to save a string in `Profile.Name` the string was not saved to the `my_aspnet_Profiles` table. If an attempt was made to force the save with `Profile.Save()` the following error was generated:

```
        Server Error in '/mono' Application

        --------------------------------------------------------------------------------

        The requested feature is not implemented.
        Description: HTTP 500. Error processing request.

        Stack Trace:

        System.Configuration.SettingsPropertyValueCollection collection) [0x00000]

        --------------------------------------------------------------------------------
        Version information: Mono Version: 2.0.50727.1433; ASP.NET Version: 2.0.50727.1433
```

(Bug #46375)

- When trying to create stored procedures from an SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
        MySql.Data.MySqlClient.MySqlException was unhandled
        Message="You have an error in your SQL syntax; check the manual that corresponds to your
```

```
        MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
        Source="MySql.Data"
        ErrorCode=-2147467259
        Number=1064
        StackTrace:
        à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
        à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
        lastInsertId)
        à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
        à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
      à MySql.Data.MySqlClient.MySqlScript.Execute()
```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug #46429)

- When using MySQL Connector/Net 6.0.4 and a MySQL Server 4.1 an exception was generated when trying to execute:

```
        connection.GetSchema("Columns", ...);
```

The exception generated was:

```
        'connection.GetSchema("Columns")' threw an exception of type
        'System.ArgumentException'System.Data.DataTable {System.ArgumentException}
        base{"Input string was not in a correct format.Couldn't store <'Select'> in
        NUMERIC_PRECISION Column.  Expected type is UInt64."}System.Exception
        {System.ArgumentException}
```

(Bug #46270)

- The MySQL Connector/Net method `StoredProcedure.GetParameters(string)` ignored the programmer's setting of the `UseProcedureBodies` option. This broke any application for which the application's parameter names did not match the parameter names in the Stored Procedure, resulting in an `ArgumentException` with the message “Parameter 'foo' not found in the collection.” and the following stack trace:

```

```

(Bug #46213)

- When reading data, such as with a `MySqlDataAdapter` on a `MySqlConnection`, MySQL Connector/Net could potentially enter an infinite loop in `CompressedStream.ReadNextpacket()` if compression was enabled. (Bug #43678)
- MySQL Connector/Net CHM documentation stated that MySQL Server 3.23 was supported. (Bug #42110)
- An error occurred when building MySQL Connector/Net from source code checked out from the public SVN repository. This happened on Linux using Mono and Nant. The Mono JIT compiler version was 1.2.6.0. The Nant version was 0.85.

  When an attempt was made to build (for example) the MySQL Connector/Net 5.2 branch using the command:

```
        $ nant -buildfile:Client.build
```

The following error occurred:

```
        BUILD FAILED

        Error loading buildfile.
```

```
        Encoding name 'Windows-1252' not supported.
        Parameter name: name
```

(Bug #42411)

- Using a `DataAdapter` with a linked `MySqlCommandBuilder` the following exception was thrown when trying to call `da.Update(DataRow[] rows)`:

```
Connection must be valid and open
```

(Bug #34657)

D.3.8.2. Changes in MySQL Connector/Net 5.2.7 (15 July 2009)

Bugs Fixed

- The `EscapeString` code carried out escaping by calling `string.Replace` multiple times. This resulted in a performance bottleneck, as for every line a new string was allocated and another was disposed of by the garbage collector. (Bug #45699)
- A MySQL Connector/Net test program that connected to MySQL Server using the connection string option `compress=true` crashed, but only when running on Mono. The program worked as expected when running on Microsoft Windows.

  This was due to a bug in Mono. MySQL Connector/Net was modified to avoid using `WeakReferences` in the `Compressed` stream class, which was causing the crash. (Bug #45463)
- MySQL Connector/Net generated the following exception:

```
System.NullReferenceException: Object reference not set to an instance of an object.
      bei MySql.Data.MySqlClient.MySqlCommand.TimeoutExpired(Object commandObject)
      bei System.Threading._TimerCallback.TimerCallback_Context(Object state)
      bei System.Threading.ExecutionContext.runTryCode(Object userData)
      bei
      System.Runtime.CompilerServices.RuntimeHelpers.ExecuteCodeWithGuaranteedCleanup(TryCode
      code, CleanupCode backoutCode, Object userData)
      bei System.Threading.ExecutionContext.RunInternal(ExecutionContext executionContext,
      ContextCallback callback, Object state)
      bei System.Threading.ExecutionContext.Run(ExecutionContext executionContext,
      ContextCallback callback, Object state)
      bei System.Threading._TimerCallback.PerformTimerCallback(Object state)
```

(Bug #40005)

- After a Reference to "C:\Program Files\MySQL\MySQL Connector Net 5.2.4\Compact Framework\MySql.Data.CF.dll" was added to a Windows Mobile 5.0 project, the project then failed to build, generating a Microsoft Visual C# compiler error.

  The error generated was:

```
Error 2 The type 'System.Runtime.CompilerServices.CompilerGeneratedAttribute'
      has no constructors defined MysqlTest
      Error 3 Internal Compiler Error (0xc0000005 at address 5A7E3714):
      likely culprit is 'COMPILE'.
```

(Bug #42261)

- If a certain socket exception occurred when trying to establish a MySQL database connection, MySQL Connector/Net displayed an exception message that appeared to be unrelated to the underlying problem. This masked the problem and made diagnosing problems more difficult.

  For example, if, when establishing a database connection using TCP/IP, Windows on the local machine allocated an ephemeral port that conflicted with a socket address still in use, then Windows/.NET would throw a socket exception with the following error text:

```
Only one usage of each socket address (protocol/network address/port) is normally
      permitted IP ADDRESS/PORT.
```

However, MySQL Connector/Net masked this socket exception and displayed an exception with the following text:

```
Unable to connect to any of the specified MySQL hosts.
```

(Bug #45021)

- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it was not possible to build MySQL Connector/Net from source. (Bug #44822)
- The MySQL Connector/Net MySQLRoleProvider reported that there were no roles, even when roles existed. (Bug #44414)
- When a TableAdapter was created on a DataSet, it was not possible to use a stored procedure with variables. The following error was generated:

```
The method or operation is not implemented
```

(Bug #39409)

D.3.8.3. Changes in MySQL Connector/Net 5.2.6 (28 April 2009)

Functionality Added or Changed

- A new connection string option has been added: `use affected rows`. When `true` the connection will report changed rows instead of found rows. (Bug #44194)

Bugs Fixed

- Calling `GetSchema()` on `Indexes` or `IndexColumns` failed where index or column names were restricted.

  In `SchemaProvider.cs`, methods `GetIndexes()` and `GetIndexColumns()` passed their restrictions directly to `GetTables()`. This only worked if the restrictions were no more specific than `schemaName` and `tableName`. If `IndexName` was given, this was passed to `GetTables()` where it was treated as `TableType`. As a result no tables were returned, unless the index name happened to be `BASE TABLE` or `VIEW`. This meant that both methods failed to return any rows. (Bug #43991)

- `GetSchema("MetaDataCollections")` should have returned a table with a column named “NumberOfRestrictions” not “NumberOfRestriction”.

  This can be confirmed by referencing the Microsoft Documentation. (Bug #43990)

- Requests sent to the MySQL Connector/Net role provider to remove a user from a role failed. The query log showed the query was correctly executed within a transaction which was immediately rolled back. The rollback was caused by a missing call to the `Complete` method of the transaction. (Bug #43553)
- A null reference exception was generated when `MySqlConnection.ClearPool(connection)` was called. (Bug #42801)
- The `GetGuid()` method of `MySqlDataReader` did not treat `BINARY(16)` column data as a GUID. When operating on such a column a `FormatException` exception was generated. (Bug #41452)
- When using `MySqlBulkLoader.Load()`, the text file is opened by `NativeDriver.SendFileToServer`. If it encountered a problem opening the file as a stream, an exception was generated and caught. An attempt to clean up resources was then made in the `finally{}` clause by calling `fs.Close()`, but since the stream was never successfully opened, this was an attempt to execute a method of a null reference. (Bug #43332)
- `MySQLMembershipProvider.ValidateUser` only used the `userId` to validate. However, it should also use the `applicationId` to perform the validation correctly.

  The generated query was, for example:

```
SELECT Password, PasswordKey, PasswordFormat, IsApproved, Islockedout
      FROM my_aspnet_Membership WHERE userId=13
```

  Note that `applicationId` is not used. (Bug #42574)

- When ASP.NET membership was configured to not require password question and answer using `requiresQuestionAndAnswer="false"`, a `SqlNullValueException` was generated when using `MembershipUser.ResetPassword()` to reset the user password. (Bug #41408)
- There was an error in the `ProfileProvider` class in the `private ProfileInfoCollection GetProfiles()`

function. The column of the final table was named “lastUpdatdDate” ('e' is missing) instead of the correct “lastUpdatedDate”. (Bug #41654)

- When `MySql.Web.Profile.MySQLProfileProvider` was configured, it was not possible to assign a name other than the default name `MySQLProfileProvider`.

  If the name `SCC_MySQLProfileProvider` was assigned, an exception was generated when attempting to use `Page.Context.Profile['custom prop']`.

  The exception generated was:

  ```
  The profile default provider was not found.
  ```

  Note that the exception stated: 'the profile **default provider**...', even though a different name was explicitly requested. (Bug #40871)

- If a `Stored Procedure` contained spaces in its parameter list, and was then called from MySQL Connector/Net, an exception was generated. However, the same `Stored Procedure` called from the MySQL Query Analyzer or the MySQL Client worked correctly.

  The exception generated was:

  ```
          Parameter '0' not found in the collection.
  ```

  (Bug #41034)

- The `DATETIME` format contained an erroneous space. (Bug #41021)

- When `ExecuteNonQuery` was called with a command type of `Stored Procedure` it worked for one user but resulted in a hang for another user with the same database permissions.

  However, if `CALL` was used in the command text and `ExecuteNonQuery` was used with a command type of `Text`, the call worked for both users. (Bug #40139)

D.3.8.4. Changes in MySQL Connector/Net 5.2.5 (19 November 2008)

Bugs Fixed

- Visual Studio 2008 displayed the following error three times on start-up:

  ```
          "Package Load Failure

          Package 'MySql.Data.VisualStudio.MySqlDataProviderPackage, MySql.VisualStudio,
          Version=5.2.4, Culture=neutral, PublicKeyToken=null' has failed to load properly (GUID =
          {79A115C9-B133-4891-9E7B-242509DAD272}).  Please contact the package vendor for
          assistance.  Application restart is recommended, due to possible environment corruption.
          Would you like to disable loading the package in the future?  You may use
          'devenve/resetskippkgs' to re-enable package loading."
  ```

  (Bug #40726)

D.3.8.5. Changes in MySQL Connector/Net 5.2.4 (13 November 2008)

Bugs Fixed

- `MySqlDataReader` did not feature a `GetSByte` method. (Bug #40571)

- `GetDefaultCollation` and `GetMaxLength` were not thread safe. These functions called the database to get a set of parameters and cached them in two static dictionaries in the function `InitCollections`. However, if many threads called them they would try to insert the same keys in the collections resulting in duplicate key exceptions. (Bug #40231)

- The connection string option `Functions Return String` did not set the correct encoding for the result string. Even though the connection string option `Functions Return String=true;` is set, the result of `SELECT DES_DECRYPT()` contained “??” instead of the correct national character symbols. (Bug #40076)

- When working with stored procedures MySQL Connector/Net generated an exception `Unknown "table parameters"`

`in information_schema`. (Bug #40382)

- If connection pooling was not set explicitly in the connection string, MySQL Connector/Net added ";Pooling=False" to the end of the connection string when `MySqlCommand.ExecuteReader()` was called.

  If connection pooling was explicitly set in the connection string, when `MySqlConnection.Open()` was called it converted "Pooling=True" to "pooling=True".

  If `MySqlCommand.ExecuteReader()` was subsequently called, it concatenated ";Pooling=False" to the end of the connection string. The resulting connection string was thus terminated with "pooling=True;Pooling=False". This disabled connection pooling completely. (Bug #40091)

- After the `ConnectionString` property was initialized using the public setter of `DbConnectionStringBuilder`, the `GetConnectionString` method of `MySqlConnectionStringBuilder` incorrectly returned `null` when `true` was assigned to the `includePass` parameter. (Bug #39728)

- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. (Bug #39817)

- When using `ProfileProvider`, attempting to update a previously saved property failed. (Bug #39330)

- Reading a negative time value greater than -01:00:00 returned the absolute value of the original time value. (Bug #39294)

- Inserting a negative time value (negative `TimeSpan`) into a `Time` column through the use of `MySqlParameter` caused `MySqlException` to be thrown. (Bug #39275)

- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerateschema="true"`. (Bug #39072)

- MySQL Connector/Net called hashed password methods not supported in Mono 2.0 Preview 2. (Bug #38895)

- When a data connection was created in the server explorer of Visual Studio 2008 Team, an error was generated when trying to expand stored procedures that had parameters.

  Also, if **TableAdapter** was right-clicked and then Add, Query, Use Existing Stored Procedures selected, if you then attempted to select a stored procedure, the window would close and no error message would be displayed. (Bug #39252)

D.3.8.6. Changes in MySQL Connector/Net 5.2.3 (19 August 2008)

Functionality Added or Changed

- Error string was returned after a 28000 second `wait_timeout`. This has been changed to generate a `ConnectionState.Closed` event. (Bug #38119)

- String escaping functionality has been moved from the `MySqlString` class to the `MySqlHelper` class, where it can be accessed by the `EscapeString` method. (Bug #36205)

- Changed how the procedure schema collection is retrieved. If `use procedure bodies=true` then the `mysql.proc` table is selected directly as this is up to 50 times faster than the current `information_schema` implementation. If `use procedure bodies=false`, then the `information_schema` collection is queried. (Bug #36694)

Bugs Fixed

- MySQL Connector/Net uninstaller did not clean up all installed files. (Bug #38534)

- The `GetOrdinal()` method failed to return the ordinal if the column name string contained an accent. (Bug #38721)

- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. (Bug #38276)

- The provider did not silently create the user if the user did not exist. (Bug #38243)

- Unnecessary network traffic was generated for the normal case where the web provider schema was up to date. (Bug #37469)

- Executing a command that resulted in a fatal exception did not close the connection. (Bug #37991)

- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. (Bug #37968)
- In a .NET application MySQL Connector/Net modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

  The original connection string:

  ```
    host=localhost;database=test;uid=*****;pwd=*****;
  connect timeout=25; auto enlist=false;pooling=false;
  ```

  The connection string after closing `MySqlDataReader`:

  ```
    host=localhost;database=test;uid=*****;pwd=*****;
    connect timeout=25;auto enlist=false;pooling=false;
    Allow User Variables=True;Allow User Variables=False;
  Allow User Variables=True;Allow User Variables=False;
  ```

  (Bug #37955)
- `MySqlReader.GetOrdinal()` performance enhancements break existing functionality. (Bug #37239)
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. (Bug #35459)
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. (Bug #33322)
- The `autogenerateschema` option produced tables with incorrect collations. (Bug #36444)
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types (`ENUM`) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. (Bug #30603)

D.3.8.7. Changes in MySQL Connector/Net 5.2.2 (12 May 2008)

Bugs Fixed

- Product documentation incorrectly stated '?' is the preferred parameter marker. (Bug #37349)
- There was a high level of contention in the connection pooling code that could lead to delays when opening connections and submitting queries. The connection pooling code has been modified to try and limit the effects of the contention issue. (Bug #34001)
- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. (Bug #36313)
- When using the `MySQLProfileProvider`, setting profile details and then reading back saved data would result in the default values being returned instead of the updated values. (Bug #36000)
- The `DbCommandBuilder.QuoteIdentifer` method was not implemented. (Bug #35492)
- Tables with `GEOMETRY` field types would return an unknown data type exception. (Bug #36081)
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. (Bug #35619)
- When using encrypted passwords, the `GetPassword()` function would return the wrong string. (Bug #35336)
- An error would be raised when calling `GetPassword()` with a `NULL` value. (Bug #35332)
- When retrieving data where a field has been identified as containing a GUID value, the incorrect value would be returned when a previous row contained a `NULL` value for that field. (Bug #35041)
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. (Bug #34460)
- Using the `TableAdapter` wizard in combination with a suitable `SELECT` statement, only the associated `INSERT` statement would also be created, rather than the required `DELETE` and `UPDATE` statements. (Bug #31338)

- When creating a new stored procedures, the new parameter code which permits the use of the `@` symbol would interfere with the specification of a `DEFINER`. (Bug #34940)
- Using the `TableAdapter Wizard` would fail when generating commands that used stored procedures due to the change in supported parameter characters. (Bug #34941)
- Fixed profile provider that would throw an exception if you were updating a profile that already existed.
- Fixed problem in datagrid code related to creating a new table. This problem may have been introduced with .NET 2.0 SP1.

D.3.8.8. Changes in MySQL Connector/Net 5.2.1 (27 February 2008)

Bugs Fixed

- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. (Bug #34338)
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. (Bug #34359)
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. (Bug #34448)
- A number of issues were identified in the case, connection and schema areas of the code for `MembershipProvider`, `RoleProvider`, `ProfileProvider`. (Bug #34495)
- When executing statements that used stored procedures and functions, the new parameter code could fail to identify the correct parameter format. (Bug #34699)
- When using web providers, the MySQL Connector/Net would check the schema and cache the application id, even when the connection string had been set. The effect would be to break the membership provider list. (Bug #34451)
- The installer would fail to the DDEX provider binary if the Visual Studio 2005 component was not selected. The result would lead to MySQL Connector/Net not loading properly when using the interface to a MySQL server within Visual Studio. (Bug #34674)
- When using the provider to generate or update users and passwords, the password checking algorithm would not validate the password strength or requirements correctly. (Bug #34792)
- The provider code has been updated to fix a number of outstanding issues.
- Fixed problem with Visual Studio 2008 integration that caused pop-up menus on server explorer nodes to not function

D.3.8.9. Changes in MySQL Connector/Net 5.2.0 (11 February 2008)

Functionality Added or Changed

- Performing `GetValue()` on a field `TINYINT(1)` returned a `BOOLEAN`. While not a bug, this caused problems in software that expected an `INT` to be returned. A new connection string option `Treat Tiny As Boolean` has been added with a default value of `true`. If set to `false` the provider will treat `TINYINT(1)` as `INT`. (Bug #34052)
- Added ClearPool and ClearAllPools features.
- DDEX provider now works under Visual Studio 2008 beta 2.
- Added support for `DbDataAdapter UpdateBatchSize`. Batching is fully supported including collapsing inserts down into the multi-value form if possible.

Bugs Fixed

- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. (Bug #33909)
- The status of connections reported through the state change handler was not being updated correctly. (Bug #34082)
- When accessing tables from different databases within the same `TransactionScope`, the same user/password combination

would be used for each database connection. MySQL Connector/Net does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information. (Bug #34204)

- Some speed improvements have been implemented in the `TokenizeSql` process used to identify elements of SQL statements. (Bug #34220)
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. (Bug #34000)
- Commands executed from within the state change handler would fail with a `NULL` exception. (Bug #30964)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug #31090)
- Column name metadata was not using the character set as defined within the connection string being used. (Bug #31185)
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This lead to updated connection string options not being recognized if they were of a different case than the existing cached values. (Bug #31433)
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. (Bug #30116)
- Using compression in the MySQL connection with MySQL Connector/Net would be slower than using native (uncompressed) communication. (Bug #27865)
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. (Bug #26344)

D.3.9. Changes in MySQL Connector/Net Version 5.1.x

D.3.9.1. Changes in MySQL Connector/Net 5.1.8 (Not released)

Bugs Fixed

- MySQL Connector/Net generated the following exception:

```
System.NullReferenceException: Object reference not set to an instance of an object.
      bei MySql.Data.MySqlClient.MySqlCommand.TimeoutExpired(Object commandObject)
      bei System.Threading._TimerCallback.TimerCallback_Context(Object state)
      bei System.Threading.ExecutionContext.runTryCode(Object userData)
      bei
      System.Runtime.CompilerServices.RuntimeHelpers.ExecuteCodeWithGuaranteedCleanup(TryCode
      code, CleanupCode backoutCode, Object userData)
      bei System.Threading.ExecutionContext.RunInternal(ExecutionContext executionContext,
      ContextCallback callback, Object state)
      bei System.Threading.ExecutionContext.Run(ExecutionContext executionContext,
      ContextCallback callback, Object state)
      bei System.Threading._TimerCallback.PerformTimerCallback(Object state)
```

  (Bug #40005)

- Calling `GetSchema()` on `Indexes` or `IndexColumns` failed where index or column names were restricted.

  In `SchemaProvider.cs`, methods `GetIndexes()` and `GetIndexColumns()` passed their restrictions directly to `GetTables()`. This only worked if the restrictions were no more specific than `schemaName` and `tableName`. If `IndexName` was given, this was passed to `GetTables()` where it was treated as `TableType`. As a result no tables were returned, unless the index name happened to be `BASE TABLE` or `VIEW`. This meant that both methods failed to return any rows. (Bug #43991)

- The `DATETIME` format contained an erroneous space. (Bug #41021)
- If connection pooling was not set explicitly in the connection string, MySQL Connector/Net added ";Pooling=False" to the end of the connection string when `MySqlCommand.ExecuteReader()` was called.

  If connection pooling was explicitly set in the connection string, when `MySqlConnection.Open()` was called it converted "Pooling=True" to "pooling=True".

  If `MySqlCommand.ExecuteReader()` was subsequently called, it concatenated ";Pooling=False" to the end of the connection string. The resulting connection string was thus terminated with "pooling=True;Pooling=False". This disabled connection pooling completely. (Bug #40091)

- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. (Bug #39817)
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. (Bug #37968)
- Calling `MySqlDataAdapter.FillSchema` on a `SELECT` statement that referred to a table that did not exist left the connection in a bad state. After this call, all `SELECT` statements returned an empty result set. If the `SELECT` statement referred to a table that did exist then everything worked as expected. (Bug #30518)

D.3.9.2. Changes in MySQL Connector/Net 5.1.7 (21 August 2008)

Bugs Fixed

- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. (Bug #38276)
- Documentation incorrectly stated that “the DataColumn class in .NET 1.0 and 1.1 does not permit columns with type of UInt16, UInt32, or UInt64 to be autoincrement columns”. (Bug #37350)
- As `MySqlDbType.DateTime` is not available in `VB.Net` the warning `THE DATETIME ENUM VALUE IS OBSOLETE` was always shown during compilation. (Bug #37406)
- An unknown `MySqlErrorCode` was encountered when opening a connection with an incorrect password. (Bug #37398)
- Executing a command that resulted in a fatal exception did not close the connection. (Bug #37991)
- In a .NET application MySQL Connector/Net modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

  The original connection string:

  ```
    host=localhost;database=test;uid=*****;pwd=*****;
  connect timeout=25; auto enlist=false;pooling=false;
  ```

  The connection string after closing `MySqlDataReader`:

  ```
    host=localhost;database=test;uid=*****;pwd=*****;
    connect timeout=25;auto enlist=false;pooling=false;
    Allow User Variables=True;Allow User Variables=False;
  Allow User Variables=True;Allow User Variables=False;
  ```

  (Bug #37955)
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. (Bug #35459)
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. (Bug #33322)
- `SemaphoreFullException` is generated when application is closed. (Bug #36688)
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types (`ENUM`) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. (Bug #30603)

D.3.9.3. Changes in MySQL Connector/Net 5.1.6 (12 May 2008)

Bugs Fixed

- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. (Bug #36313)
- The `DbCommandBuilder.QuoteIdentifer` method was not implemented. (Bug #35492)
- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. (Bug #36432)

- The `MembershipProvider` will raise an exception when the connection string is configured with `enablePasswordRetrival = true` and `RequireQuestionAndAnswer = false`. (Bug #36159)
- When calling `GetNumberOfUsersOnline` an exception is raised on the submitted query due to a missing parameter. (Bug #36157)
- Tables with `GEOMETRY` field types would return an unknown data type exception. (Bug #36081)
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. (Bug #35619)
- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. (Bug #34338)
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. (Bug #34359)
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. (Bug #34448)
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. (Bug #34460)
- Using the `TableAdapter` wizard in combination with a suitable `SELECT` statement, only the associated `INSERT` statement would also be created, rather than the required `DELETE` and `UPDATE` statements. (Bug #31338)

D.3.9.4. Changes in MySQL Connector/Net 5.1.5 (Not released)

Functionality Added or Changed

- Performing `GetValue()` on a field `TINYINT(1)` returned a `BOOLEAN`. While not a bug, this caused problems in software that expected an `INT` to be returned. A new connection string option `Treat Tiny As Boolean` has been added with a default value of `true`. If set to `false` the provider will treat `TINYINT(1)` as `INT`. (Bug #34052)

Bugs Fixed

- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. (Bug #33909)
- The status of connections reported through the state change handler was not being updated correctly. (Bug #34082)
- When accessing tables from different databases within the same `TransactionScope`, the same user/password combination would be used for each database connection. MySQL Connector/Net does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information. (Bug #34204)
- Some speed improvements have been implemented in the `TokenizeSql` process used to identify elements of SQL statements. (Bug #34220)
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. (Bug #34000)
- Problem with membership provider would mean that `FindUserByEmail` would fail with a `MySqlException` because it was trying to add a second parameter with the same name as the first. (Bug #33347)
- MySQL Connector/Net would fail to compile properly with `nant`. (Bug #33508)
- Using compression in the MySQL connection with MySQL Connector/Net would be slower than using native (uncompressed) communication. (Bug #27865)

D.3.9.5. Changes in MySQL Connector/Net 5.1.4 (20 November 2007)

Bugs Fixed

- Trying to use a connection that was not open could return an ambiguous and misleading error message. (Bug #31262)
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. (Bug #31930)

- MySQL Connector/Net would incorrectly report success when enlisting in a distributed transaction, although distributed transactions are not supported. (Bug #31703)
- A date string could be returned incorrectly by `MySqlDateTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. (Bug #32010)
- Commands executed from within the state change handler would fail with a `NULL` exception. (Bug #30964)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug #31090)
- Column name metadata was not using the character set as defined within the connection string being used. (Bug #31185)
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This lead to updated connection string options not being recognized if they were of a different case than the existing cached values. (Bug #31433)
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. (Bug #31731)
- Creation of parameter objects with noninput direction using a constructor would fail. This was cause by some old legacy code preventing their use. (Bug #32093)
- Setting the size of a string parameter after the value could cause an exception. (Bug #32094)
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. (Bug #30116)
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to MySQL Connector/Net incorrectly identifying `BLOB` fields as binary, rather than text. (Bug #30233)
- When accessing certain statements, the command would timeout before the command completed. Because this cannot always be controlled through the individual command timeout options, a `default command timeout` has been added to the connection string options. (Bug #27958)
- Column types with only 1-bit (such as `BOOLEAN` and `TINYINT(1)` were not returned as boolean fields. (Bug #27959)
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. (Bug #26344)
- The server error code was not updated in the `Data[]` hash, which prevented `DbProviderFactory` users from accessing the server error code. (Bug #27436)
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. (Bug #13991)

D.3.9.6. Changes in MySQL Connector/Net 5.1.3 (21 September 2007, beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs Fixed

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug #30204)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug #29409)
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. (Bug #29526)
- Using the membership/role providers when `validationKey` or `decryptionKey` parameters are set to `AutoGenerate`, an exception would be raised when accessing the corresponding values. (Bug #29235)
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that uses the `SELECT` statement would terminate the query/TableAdapter wizard. (Bug #29098)
- An exception would be thrown when using the Manage Role functionality within the web administrator to assign a role to a user. (Bug #29236)

- Using `TransactionScope` would cause an `InvalidOperationException`. (Bug #28709)
- The Saudi Hijri calendar was not supported. (Bug #29931)
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. (Bug #30077)
- Connecting to a MySQL server earlier than version 4.1 would raise a `NullException`. (Bug #29476)
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. (Bug #29124)
- Using the same connection string multiple times would result in `Database=`*`dbname`* appearing multiple times in the resulting string. (Bug #29123)
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. (Bug #29312)

D.3.9.7. Changes in MySQL Connector/Net 5.1.2 (18 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Bugs Fixed

- Log messages would be truncated to 300 bytes. (Bug #28706)
- Creating a user would fail due to the application name being set incorrectly. (Bug #28648)
- Accessing the results from a large query when using data compression in the connection would fail to return all the data. (Bug #28204)
- *Visual Studio Plugin*: Query Builder would fail to show `TINYTEXT` columns, and any columns listed after a `TINYTEXT` column correctly. (Bug #28437)
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that used a `UPDATE`, `INSERT` or `DELETE` statement would terminate the query/TableAdapter wizard. (Bug #28536)
- *Visual Studio Plugin*: Update commands would not be generated correctly when using the TableAdapter wizard. (Bug #26347)

D.3.9.8. Changes in MySQL Connector/Net 5.1.1 (23 May 2007)

Bugs Fixed

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. (Bug #28448)
- Building a connection string within a tight loop would show slow performance. (Bug #28167)
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. (Bug #27668)
- Installation of the MySQL Connector/Net on Windows would fail if VisualStudio had not already been installed. (Bug #28260)
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in a exception. (Bug #23342)
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. (Bug #27679)
- MySQL Connector/Net would look for the wrong table when executing `User.IsRole().` (Bug #28251)
- Fixed password property on `MySqlConnectionStringBuilder` to use `PasswordPropertyText` attribute. This causes dots to show instead of actual password text.

D.3.9.9. Changes in MySQL Connector/Net 5.1.0 (01 May 2007)

Functionality Added or Changed

- Added Membership and Role provider contributed by Sean Wright (thanks!).
- GetSchema will now report objects relative to the currently selected database. What this means is that passing in null as a database restriction will report objects on the currently selected database only.
- Rewrote stored procedure parsing code using a new SQL tokenizer. Really nasty procedures including nested comments are now supported.
- Now compiles for .NET CF 2.0.

D.3.10. Changes in MySQL Connector/Net Version 5.0.x

D.3.10.1. Changes in MySQL Connector/Net 5.0.10 (Not released)

Bugs Fixed

- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. (Bug #39817)
- Executing a command that resulted in a fatal exception did not close the connection. (Bug #37991)
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. (Bug #37968)
- In a .NET application MySQL Connector/Net modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

  The original connection string:

  ```
    host=localhost;database=test;uid=*****;pwd=*****;
  connect timeout=25; auto enlist=false;pooling=false;
  ```

  The connection string after closing `MySqlDataReader`:

  ```
    host=localhost;database=test;uid=*****;pwd=*****;
    connect timeout=25;auto enlist=false;pooling=false;
    Allow User Variables=True;Allow User Variables=False;
  Allow User Variables=True;Allow User Variables=False;
  ```

  (Bug #37955)
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. (Bug #35459)
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. (Bug #33322)
- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. (Bug #36432)

D.3.10.2. Changes in MySQL Connector/Net 5.0.9 (Not released)

Bugs Fixed

- The `DbCommandBuilder.QuoteIdentifer` method was not implemented. (Bug #35492)
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. (Bug #31930)
- A date string could be returned incorrectly by `MySqlDateTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. (Bug #32010)
- Commands executed from within the state change handler would fail with a `NULL` exception. (Bug #30964)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug #31090)
- Column name metadata was not using the character set as defined within the connection string being used. (Bug #31185)
- Data cached from the connection string could return invalid information because the internal routines were not using case-

sensitive semantics. This lead to updated connection string options not being recognized if they were of a different case than the existing cached values. (Bug #31433)

- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. (Bug #31731)
- Creation of parameter objects with noninput direction using a constructor would fail. This was cause by some old legacy code preventing their use. (Bug #32093)
- Setting the size of a string parameter after the value could cause an exception. (Bug #32094)
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. (Bug #30116)
- The server error code was not updated in the `Data[]` hash, which prevented `DbProviderFactory` users from accessing the server error code. (Bug #27436)
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. (Bug #13991)

D.3.10.3. Changes in MySQL Connector/Net 5.0.8 (21 August 2007)

> **Note**
>
> This version introduces a new installer technology.

Bugs Fixed

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug #30204)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug #29409)
- Fixed bug where MySQL Connector/Net was hand building some date time patterns rather than using the patterns provided under CultureInfo. This caused problems with some calendars that do not support the same ranges as Gregorian.. (Bug #29931)
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. (Bug #29526)
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. (Bug #30077)
- Log messages would be truncated to 300 bytes. (Bug #28706)
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. (Bug #29124)
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to MySQL Connector/Net incorrectly identifying `BLOB` fields as binary, rather than text. (Bug #30233)
- Using the same connection string multiple times would result in `Database=`*`dbname`* appearing multiple times in the resulting string. (Bug #29123)
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. (Bug #29312)
- Accessing the results from a large query when using data compression in the connection will fail to return all the data. (Bug #28204)
- Fixed some serious issues with command timeout and cancel that could present as exceptions about thread ownership. The issue was that not all queries cancel the same. Some produce resultsets while others don't. ExecuteReader had to be changed to check for this.
- Fixed problem where a command timing out just after it actually finished would cause an exception to be thrown on the command timeout thread which would then be seen as an unhandled exception.
- Fixed problem where any attempt to not read all the records returned from a select where each row of the select is greater than

1024 bytes would hang the driver.

- Fixed the database schema collection so that it works on servers that are not properly respecting the `lower_case_table_names` setting.
- Fixed problem where we were not closing prepared statement handles when commands are disposed. This could lead to using up all prepared statement handles on the server.
- Fixed problem where `MySqlConnection.BeginTransaction` checked the drivers status var before checking if the connection was open. The result was that the driver could report an invalid condition on a previously opened connection.

D.3.10.4. Changes in MySQL Connector/Net 5.0.7 (18 May 2007)

Bugs Fixed

- When cloning an open `MySqlClient.MySqlConnection` with the `Persist Security Info=False` option set, the cloned connection is not usable because the security information has not been cloned. (Bug #27269)
- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. (Bug #28448)
- Enlisting a null transaction would affect the current connection object, such that further enlistment operations to the transaction are not possible. (Bug #26754)
- The `CreateFormat` column of the `DataTypes` collection did not contain a format specification for creating a new column type. (Bug #25947)
- Using logging (with the `logging=true` parameter to the connection string) would not generate a log file. (Bug #27765)
- Building a connection string within a tight loop would show slow performance. (Bug #28167)
- The `characterset` property would not be identified during a connection (also affected Visual Studio Plugin). (Bug #26147, Bug #27240)
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. (Bug #27668)
- Attempting to change the `Connection Protocol` property within a `PropertyGrid` control would raise an exception. (Bug #26472)
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in a exception. (Bug #23342)
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. (Bug #27679)
- If you close an open connection with an active transaction, the transaction is not automatically rolled back. (Bug #27289)

D.3.10.5. Changes in MySQL Connector/Net 5.0.6 (22 March 2007)

Bugs Fixed

- `cmd.Parameters.RemoveAt("Id")` will cause an error if the last item is requested. (Bug #27187)
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. (Bug #27135)
- MySQL Visual Studio Plugin 1.1.2 does not work with MySQL Connector/Net 5.0.5. (Bug #26960)
- Exception thrown when using large values in `UInt64` parameters. (Bug #27093)
- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. (Bug #27253)
- `DESCRIBE ...` SQL statement returns byte arrays rather than data on MySQL versions older than 4.1.15. (Bug #27221)

D.3.10.6. Changes in MySQL Connector/Net 5.0.5 (07 March 2007)

Functionality Added or Changed

- Added `Use Procedure Bodies` connection string option to enable calling procedures without using procedure metadata.
- Fixed problem with calling stored functions when a return parameter was not given.
- Fixed problem with parameter name hashing where the hashes were not getting updated when parameters were removed from the collection.
- Return parameters created with DeriveParameters now have the name `RETURN_VALUE`.
- Added `MySqlParameterCollection.AddWithValue` and marked the `Add(name, value)` method as obsolete.
- Fixed problem that prevented use of `SchemaOnly` or `SingleRow` command behaviors with stored procedures or prepared statements.
- Assembly now properly appears in the Visual Studio 2005 Add/Remove Reference dialog.
- Reverted behavior that required parameter names to start with the parameter marker. We apologize for this back and forth but we mistakenly changed the behavior to not match what `SqlClient` supports. We now support using either syntax for adding parameters however we also respond exactly like `SqlClient` in that if you ask for the index of a parameter using a syntax different from when you added the parameter, the result will be -1.

Bugs Fixed

- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, data type. (Bug #25605)
- `MySqlConnection` throws an exception when connecting to MySQL v4.1.7. (Bug #25726)
- Incorrect values/formats would be applied when the `OldSyntax` connection string option was used. (Bug #25950)
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlPool.GetConnection`. (Bug #24373)
- Opening a connection would be slow due to host name lookup. (Bug #26152)
- The `UpdateRowSource.FirstReturnedRecord` method does not work. (Bug #25569)
- When closing and then re-opening a connection to a database, the character set specification is lost. (Bug #25614)
- Filling a table schema through a stored procedure triggers a runtime error. (Bug #25609)
- Returned data types of a `DataTypes` collection do not contain the right correct CLR data type. (Bug #25907)
- When connecting to a MySQL Server earlier than version 4.1, the connection would hang when reading data. (Bug #25458)
- Registry would be incorrectly populated with installation locations. (Bug #25928)
- `MySqlConnection.GetSchema` fails with `NullReferenceException` for Foreign Keys. (Bug #26660)
- Times with negative values would be returned incorrectly. (Bug #25912)
- MySQL Connector/Net would not compile properly when used with Mono 1.2. (Bug #24263)
- MySQL Connector/Net would fail to install under Windows Vista. (Bug #26430)
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. (Bug #25443)
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug #24957)
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. (Bug #25603)
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. (Bug #24802)
- `GetSchema` and `DataTypes` would throw an exception due to an incorrect table name. (Bug #25906)
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. (Bug #25651)
- Applications would crash when calling with `CommandType` set to `StoredProcedure`.

D.3.10.7. Changes in MySQL Connector/Net 5.0.4 (Not released)

This is a new Beta development release, fixing recently discovered bugs.

Version 5.0.4 has no changelog entries.

D.3.10.8. Changes in MySQL Connector/Net 5.0.3 (05 January 2007)

Functionality Added or Changed

- SSL support has been updated.
- The ShapZipLib library has been replaced with the deflate support provided within .NET 2.0.
- Support for the embedded server and client library have been removed from this release. Support will be added back to a later release.
- Improved speed and performance by re-architecting certain sections of the code.
- The `ViewColumns GetSchema` collection has been updated.
- The `CommandBuilder.DeriveParameters` function has been updated to the procedure cache.
- Metadata from stored procedures and stored function execution are cached.
- The `MySqlCommand` object now supports asynchronous query methods. This is implemented useg the `BeginExecuteNonQuery` and `EndExecuteNonQuery` methods.
- PerfMon hooks have been added to monitor the stored procedure cache hits and misses.
- Usage Advisor has been implemented. The Usage Advisor checks your queries and will report if you are using the connection inefficiently.

Bugs Fixed

- When using a `DbNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DbNull.Value`. (Bug #24565)
- Using `Driver.IsTooOld()` would return the wrong value. (Bug #24661)
- Nested transactions (which are unsupported)do not raise an error or warning. (Bug #22400)
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. (Bug #25013)
- Deleting a connection to a disconnected server when using the Visual Studio Plugin would cause an assertion failure. (Bug #23687)
- Additional text added to error message (Bug #25178)
- An exception would be raised, or the process would hang, if `SELECT` privileges on a database were not granted and a stored procedure was used. (Bug #25033)
- Stored procedure executions are not thread safe. (Bug #23905)

D.3.10.9. Changes in MySQL Connector/Net 5.0.2 (06 November 2006)

Functionality Added or Changed

- **Important change:** Due to a number of issues with the use of server-side prepared statements, MySQL Connector/Net 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

  To enable server-side prepared statements you must add the following configuration property to your connector string properties:

```
ignore prepare=false
```

The default value of this property is true.

- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.
- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.

Bugs Fixed

- An exception would be thrown when calling `GetSchemaTable` and `fields` was null. (Bug #23538)
- During installation, an antivirus error message would be raised (indicating a malicious script problem). (Bug #23245)
- One system where IPv6 was enabled, MySQL Connector/Net would incorrectly resolve host names. (Bug #23758)
- A `System.FormatException` exception would be raised when invoking a stored procedure with an `ENUM` input parameter. (Bug #23268)
- Using Windows Vista (RC2) as a nonprivileged user would raise a `Registry key 'Global' access denied`. (Bug #22882)
- Column names with accented characters were not parsed properly causing malformed column names in result sets. (Bug #23657)
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that MySQL Connector/Net 5.0.2 must be installed. (Bug #23071)
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug #18186)
- MySQL Connector/Net did not work as a data source for the `SqlDataSource` object used by ASP.NET 2.0. (Bug #16126)

D.3.10.10. Changes in MySQL Connector/Net 5.0.1 (01 October 2006)

Bugs Fixed

- The `MySqlexception` class is now derived from the `DbException` class. (Bug #21874)
- Starting a transaction on a connection created by `MySql.Data.MySqlClient.MySqlClientFactory`, using `BeginTransaction` without specifying an isolation level, causes the SQL statement to fail with a syntax error. (Bug #22042)
- The `#` would not be accepted within column/table names, even though it was valid. (Bug #21521)
- MySQL Connector/Net on a Turkish operating system, may fail to execute certain SQL statements correctly. (Bug #22452)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a MySQL Connector/Net exception. (Bug #18391)
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. (Bug #14592)
- You can now install the MySQL Connector/Net MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug #19994)
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. (Bug #7248)
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. (Bug #11991)
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). (Bug #9619)

D.3.10.11. Changes in MySQL Connector/Net 5.0.0 (08 August 2006)

Functionality Added or Changed

- Implemented `MySqlConnectionBuilder` class.
- Completely refactored how column values are handled to avoid boxing in some cases.
- Implemented Usage Advisor.
- Added Async query methods.
- Implemented classes and interfaces for ADO.Net 2.0 support.
- Added perfmon hooks for stored procedure cache hits and misses.
- Implemented `MySqlClientFactory` class.
- Added internal implemention of SHA1 so we don't have to distribute the OpenNetCF on mobile devices.
- Added procedure metadata caching.
- Reworked connection string classes to be simpler and faster.
- Reimplemented PacketReader/PacketWriter support into `MySqlStream` class.
- Added usage advisor warnings for requesting column values by the wrong type.
- Refactored test suite to test all protocols in a single pass.
- Replaced use of ICSharpCode with .NET 2.0 internal deflate support.

Bugs Fixed

- CommandText: Question mark in comment line is being parsed as a parameter. (Bug #6214)

D.3.11. Changes in MySQL Connector/Net Version 1.0.x

D.3.11.1. Changes in MySQL Connector/Net 1.0.11 (Not released)

Bugs Fixed

- Attempting to utilize MySQL Connector .Net version 1.0.10 throws a fatal exception under Mono when pooling is enabled. (Bug #33682)
- Commands executed from within the state change handler would fail with a `NULL` exception. (Bug #30964)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug #31090)
- Creation of parameter objects with noninput direction using a constructor would fail. This was cause by some old legacy code preventing their use. (Bug #32093)
- Setting the size of a string parameter after the value could cause an exception. (Bug #32094)
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to MySQL Connector/Net incorrectly identifying `BLOB` fields as binary, rather than text. (Bug #30233)
- Using compression in the MySQL connection with MySQL Connector/Net would be slower than using native (uncompressed) communication. (Bug #27865)
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. (Bug #13991)

D.3.11.2. Changes in MySQL Connector/Net 1.0.10 (24 August 2007)

Bugs Fixed

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug #30204)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug #29409)
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, data type. (Bug #25605)
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. (Bug #27135)
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlPool.GetConnection`. (Bug #24373)
- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. (Bug #27253)
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug #24957)
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. (Bug #25603)

D.3.11.3. Changes in MySQL Connector/Net 1.0.9 (02 February 2007)

Functionality Added or Changed

- **Important change:** Due to a number of issues with the use of server-side prepared statements, MySQL Connector/Net 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

  To enable server-side prepared statements you must add the following configuration property to your connector string properties:

  ```
  ignore prepare=false
  ```

  The default value of this property is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.
- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Improved `CommandBuilder.DeriveParameters` to first try and use the procedure cache before querying for the stored procedure metadata. Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- **Important change:** Binaries for .NET 1.0 are no longer supplied with this release. If you need support for .NET 1.0, you must build from source.
- The ICSharpCode ZipLib is no longer used by the Connector, and is no longer distributed with it.

Bugs Fixed

- When using a `DbNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DbNull.Value`. (Bug #24565)
- An `System.OverflowException` would be raised when accessing a varchar field over 255 bytes. (Bug #23749)
- Using `Driver.IsTooOld()` would return the wrong value. (Bug #24661)
- Nested transactions do not raise an error or warning. (Bug #22400)
- Additional text added to error message. (Bug #25178)

- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. (Bug #25013)
- `MySqlConnection` throws a `NullReferenceException` and `ArgumentNullException` when connecting to MySQL v4.1.7. (Bug #25726)
- When closing and then re-opening a connection to a database, the character set specification is lost. (Bug #25614)
- Trying to fill a table schema through a stored procedure triggers a runtime error. (Bug #25609)
- One system where IPv6 was enabled, MySQL Connector/Net would incorrectly resolve host names. (Bug #23758)
- Times with negative values would be returned incorrectly. (Bug #25912)
- The `CommandBuilder` would mistakenly add insert parameters for a table column with auto incrementation enabled. (Bug #23862)
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. (Bug #25443)
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. (Bug #24802)
- Stored procedure executions are not thread safe. (Bug #23905)
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. (Bug #25651)
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug #18186)

D.3.11.4. Changes in MySQL Connector/Net 1.0.8 (20 October 2006)

Functionality Added or Changed

- The method for retrieving stored procedure metadata has been changed so that users without `SELECT` privileges on the `mysql.proc` table can use a stored procedure.
- Stored procedures are now cached.

Bugs Fixed

- The # would not be accepted within column/table names, even though it was valid. (Bug #21521)
- MySQL Connector/Net on a Turkish operating system, may fail to execute certain SQL statements correctly. (Bug #22452)
- Calling `Close` on a connection after calling a stored procedure would trigger a `NullReferenceException`. (Bug #20581)
- When working with multiple threads, character set initialization would generate errors. (Bug #17106)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a MySQL Connector/Net exception. (Bug #18391)
- Called `MySqlCommandBuilder.DeriveParameters` for a stored procedure that has no paramers would cause an application crash. (Bug #15077)
- The connection string parser did not permit single or double quotation marks in the password. (Bug #16659)
- The CommandBuilder ignored Unsigned flag at Parameter creation. (Bug #17375)
- CHAR type added to MySqlDbType. (Bug #17749)
- Parameter substitution in queries where the order of parameters and table fields did not match would substitute incorrect values. (Bug #19261)
- The `MySqlDateTime` class did not contain constructors. (Bug #15112)
- When running a query that included a date comparison, a DateReader error would be raised. (Bug #19481)

- When using an unsigned 64-bit integer in a stored procedure, the unsigned bit would be lost stored. (Bug #16934)
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. (Bug #14592)
- A `SELECT` query on a table with a date with a value of `'0000-00-00'` would hang the application. (Bug #17736)
- You can now install the MySQL Connector/Net MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug #19994)
- The DiscoverParameters function would fail when a stored procedure used a `NUMERIC` parameter type. (Bug #19515)
- Unsigned data types were not properly supported. (Bug #16788)
- `DataReader` would show the value of the previous row (or last row with nonnull data) if the current row contained a `datetime` field with a null value. (Bug #16884)
- `IDataRecord.GetString` would raise `NullPointerException` for null values in returned rows. Method now throws `SqlNullValueException`. (Bug #19294)
- An exception would be raised when using an output parameter to a `System.String` value. (Bug #17814)
- When using `MySqlDataAdapter`, connections to a MySQL server may remain open and active, even though the use of the connection has been completed and the data received. (Bug #8131)
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. (Bug #7248)
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. (Bug #11991)
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). (Bug #9619)

D.3.11.5. Changes in MySQL Connector/Net 1.0.7 (21 November 2005)

Bugs Fixed

- Calling a stored procedure where a parameter contained special characters (such as `'@'`) would produce an exception. Note that `ANSI_QUOTES` had to be enabled to make this possible. (Bug #13753)
- A `#42000Query was empty` exception occurred when executing a query built with `MySqlCommandBuilder`, if the query string ended with a semicolon. (Bug #14631)
- The parameter collection object's `Add()` method added parameters to the list without first checking to see whether they already existed. Now it updates the value of the existing parameter object if it exists. (Bug #13927)
- Added support for the `cp932` character set. (Bug #13806)
- The `Ping()` method did not update the `State` property of the `Connection` object. (Bug #13658)
- Implemented the `MySqlCommandBuilder.DeriveParameters` method that is used to discover the parameters for a stored procedure. (Bug #13632)
- A statement that contained multiple references to the same parameter could not be prepared. (Bug #13541)
- Unsigned `tinyint` (NET byte) would lead to and incorrectly determined parameter type from the parameter value. (Bug #18570)

D.3.11.6. Changes in MySQL Connector/Net 1.0.6 (03 October 2005)

Bugs Fixed

- Field names that contained the following characters caused errors: `()%<>/` (Bug #13036)
- MySQL Connector/Net 1.0.5 could not connect on Mono. (Bug #13345)
- The MySQL Connector/Net 1.0.5 installer would not install alongside MySQL Connector/Net 1.0.4. (Bug #12835)

- Serializing a parameter failed if the first value passed in was `NULL`. (Bug #13276)
- The `nant` build sequence had problems. (Bug #12978)

D.3.11.7. Changes in MySQL Connector/Net 1.0.5 (29 August 2005)

Bugs Fixed

- The `ConnectionString` property could not be set when a `MySqlConnection` object was added with the designer. (Bug #12551, Bug #8724)
- With multiple hosts in the connection string, MySQL Connector/Net would not connect to the last host in the list. (Bug #12628)
- MySQL Connector/Net could not connect to MySQL 4.1.14. (Bug #12771)
- A call to a stored procedure caused an exception if the stored procedure had no parameters. (Bug #11542)
- Added support to call a stored function from MySQL Connector/Net. (Bug #10644)
- MySQL Connector/Net interpreted the new decimal data type as a byte array. (Bug #11294)
- Trying to use a stored procedure when `Connection.Database` was not populated generated an exception. (Bug #11450)
- Connection could fail when .NET thread pool had no available worker threads. (Bug #10637)
- Certain malformed queries would trigger a `Connection must be valid and open` error message. (Bug #11490)
- Trying to read a `TIMESTAMP` column generated an exception. (Bug #7951)
- Decimal parameters caused syntax errors. (Bug #10152, Bug #11550, Bug #10486)
- Parameters were not recognized when they were separated by linefeeds. (Bug #9722)
- The `cp1250` character set was not supported. (Bug #11621)
- Calling `MySqlConnection.clone` when a connection string had not yet been set on the original connection would generate an error. (Bug #10281)
- The `MySqlCommandBuilder` class could not handle queries that referenced tables in a database other than the default database. (Bug #8382)
- MySQL Connector/Net could not work properly with certain regional settings. (WL#8228)

D.3.11.8. Changes in MySQL Connector/Net 1.0.4 (20 January 2005)

Bugs Fixed

- `MySqlCommand.Connection` returns an IDbConnection. (Bug #7258)
- Quote character \222 not quoted in `EscapeString`. (Bug #7724)
- Clone method bug in `MySqlCommand`. (Bug #7478)
- Calling prepare causing exception. (Bug #7243)
- `MySqlDataReader.GetString(index)` returns non-Null value when field is `Null`. (Bug #7612)
- `MySqlAdapter.Fill` method throws error message `Non-negative number required`. (Bug #7345)
- Problem with Multiple resultsets. (Bug #7436)
- `MySqlReader.GetInt32` throws exception if column is unsigned. (Bug #7755)
- GetBytes is working no more. (Bug #7704)
- Fixed problem that causes named pipes to not work with some blob functionality.
- Fixed another small problem with prepared statements.

- Added or filled out several more topics in the API reference documentation.
- Fixed problem with shared memory connections.

D.3.11.9. Changes in MySQL Connector/Net 1.0.3 (12 October 2004, gamma)

Bugs Fixed

- Inserting `DateTime` causes `System.InvalidCastException` to be thrown. (Bug #7132)
- Integer "out" parameter from stored procedure returned as string. (Bug #6668)
- Int64 Support in `MySqlCommand` Parameters. (Bug #6863)
- Invalid query string when using inout parameters (Bug #7133)
- Errors in parsing stored procedure parameters. (Bug #6902)
- InvalidCast when using `DATE_ADD`-function. (Bug #6879)
- `MySqlDateTime` in Datatables sorting by Text, not Date. (Bug #7032)
- `MySqlDataReader.GetChar(int i)` throws `IndexOutOfRange` exception. (Bug #6770)
- An Open Connection has been Closed by the Host System. (Bug #6634)
- Fixed Invalid character set index: 200. (Bug #6547)
- Exception stack trace lost when re-throwing exceptions. (Bug #6983)
- Test suite fails with MySQL 4.0 because of case sensitivity of table names. (Bug #6831)
- Made MySQL the default named pipe name.
- Now `SHOW COLLATION` is used upon connection to retrieve the full list of charset ids.
- Changed the name of the test suite to `MySql.Data.Tests.dll`.
- Added Ping method to `MySqlConnection`.
- Added `ServerThread` property to `MySqlConnection` to expose server thread id.
- Fixed problem where multiple resultsets having different numbers of columns would cause a problem.
- Fixed major problem with detecting null values when using prepared statements.
- Installer now includes options to install into GAC and create START MENU items.
- Connections now do not have to give a database on the connection string.

D.3.11.10. Changes in MySQL Connector/Net 1.0.2 (15 November 2004, gamma)

Bugs Fixed

- Fixed Objects not being disposed (Bug #6649)
- Fixed double type handling in MySqlParameter(string parameterName, object value). (Bug #6428)
- Fixed #HY000 Illegal mix of collations (latin1_swedish_ci,IMPLICIT) and (utf8_general_ (Bug #6322)
- Fixed Installation directory ignored using custom installation (Bug #6329)
- Fixed Charset-map for UCS-2 (Bug #6541)
- Fixed Zero date "0000-00-00" is returned wrong when filling Dataset (Bug #6429)
- Fixed problem where calling stored procedures might cause an "Illegal mix of collations" problem.

- Fixed Long inserts take very long time (Bu #5453)
- Fixed problem where setting command text leaves the command in a prepared state
- Updated the installer to include the new samples
- Provider is now using character set specified by server as default
- Fixed problem with MySqlBinary where string values could not be used to update extended text columns
- Added charset connection string option
- Added the TableEditor CS and VB sample

D.3.11.11. Changes in MySQL Connector/Net 1.0.1 (27 October 2004, beta)

Bugs Fixed

- Setting `DbType` threw a `NullReferenceException`. (Bug #5469)
- Fixed constructor initialize problems in MySqlCommand() (Bug #5613)
- Fixed System.OverflowException when using `YEAR` data type. (Bug #6036)
- Fixed Yet Another "object reference not set to an instance of an object" (Bug #5496)
- Fixed Parsing the ';' char (Bug #5876)
- Fixed MySqlDataReader and 'show tables from ...' behavior (Bug #5256)
- Fixed problem where MySqlParameterCollection.Add() would throw unclear exception when given a null value (Bug #5621)
- Cannot run a stored procedure populating mysqlcommand.parameters (Bug #5474)
- Fixed IndexOutOfBounds when reading `BLOB` with `DataReader` with `GetString(index)`. (Bug #6230)
- Fixed MySqlDateTime sets IsZero property on all subseq.records after first zero found (Bug #6006)
- `MySqlCommand` saw instances of `"?"` as parameters in string literals. (Bug #5392)
- Possible bug in MySqlParameter(string, object) constructor (Bug #5602)
- Fixed NET Connector source missing resx files (Bug #6216)
- Fixed serializing of floating point parameters (double, numeric, single, decimal) (Bug #5900)
- Fixed Method TokenizeSql() uses only a limited set of valid characters for parameters (Bug #6217)
- `DataReader` reported all rows as `NULL` if one row was `NULL`. (Bug #5388)
- Fixed Can't display Chinese correctly (Bug #5288)
- Fixed missing Reference in DbType setter (Bug #5897)
- Fixed GetBoolean returns wrong values (Bug #6227)
- IsNullable error (Bug #5796)
- Fixed DBNull Values causing problems with retrieving/updating queries. (Bug #5798)
- Calling `GetChars` on a `LONGTEXT` column threw an exception. (Bug #5458)
- Virtualized driver subsystem so future releases could easily support client or embedded server support
- CP1252 is now used for Latin1 only when the server is 4.1.2 and later
- Refactored compression code into CompressedStream to clean up NativeDriver
- Fixed problem where Min Pool Size was not being respected

- Fixed problem where connector was not issuing a CMD_QUIT before closing the socket
- Fixed Russian character support as well
- Fixed problem with ConnectionInternal where a key might be added more than once
- Implemented SequentialAccess
- Using PacketWriter instead of Packet for writing to streams
- Added Aggregate function test (wasn't really a bug)
- Field buffers being reused to decrease memory allocations and increase speed
- Fixed problem where connection lifetime on the connect string was not being respected
- Added test case for resetting the command text on a prepared command
- Fixed problem where using old syntax while using the interfaces caused problems
- Fixed problem in PacketReader where it could try to allocate the wrong buffer size in EnsureCapacity

D.3.11.12. Changes in MySQL Connector/Net 1.0.0 (01 September 2004)

Bugs Fixed

- Removed some last references to ByteFX.
- Fixed problem with using compression.
- Updated many of the test cases.
- Thai encoding not correctly supported. (Bug #3889)
- Added `COPYING.rtf` file for use in installer.
- Removed all of the XML comment warnings.
- Bumped version number to 1.0.0 for beta 1 release.

D.3.12. Changes in MySQL Connector/Net Version 0.9.0 (30 August 2004)

- Added test fixture for prepared statements.
- All type classes now implement a `SerializeBinary` method for sending their data to a `PacketWriter`.
- Added `PacketWriter` class that will enable future low-memory large object handling.
- Fixed many small bugs in running prepared statements and stored procedures.
- Changed command so that an exception will not be thrown in executing a stored procedure with parameters in old syntax mode.
- `SingleRow` behavior now working right even with limit.
- `GetBytes` now only works on binary columns.
- Logger now truncates long SQL commands so blob columns do not blow out our log.
- Host and database now have a default value of "" unless otherwise set.
- Connection Timeout seems to be ignored. (Bug #5214)
- Added test case for bug# 5051: GetSchema not working correctly.
- Fixed problem where `GetSchema` would return false for `IsUnique` when the column is key.
- `MySqlDataReader GetXXX` methods now using the field level `MySqlValue` object and not performing conversions.

- `DataReader` returning `NULL` for time column. (Bug #5097)
- Added test case for `LOAD DATA LOCAL INFILE`.
- Added replacetext custom nant task.
- Added `CommandBuilderTest` fixture.
- Added Last One Wins feature to `CommandBuilder`.
- Fixed persist security info case problem.
- Fixed `GetBool` so that 1, true, "true", and "yes" all count as true.
- Make parameter mark configurable.
- Added the "old syntax" connection string parameter to enable use of @ parameter marker.
- `MySqlCommandBuilder`. (Bug #4658)
- `ByteFX.MySqlClient` caches passwords if `Persist Security Info` is false. (Bug #4864)
- Updated license banner in all source files to include FLOSS exception.
- Added new .Types namespace and implementations for most current MySql types.
- Added `MySqlField41` as a subclass of `MySqlField`.
- Changed many classes to now use the new .Types types.
- Changed type `enum int` to `Int32`, `short` to `Int16`, and `bigint` to `Int64`.
- Added dummy types `UInt16`, `UInt32`, and `UInt64` to allow an unsigned parameter to be made.
- Connections are now reset when they are pulled from the connection pool.
- Refactored auth code in driver so it can be used for both auth and reset.
- Added `UserReset` test in `PoolingTests.cs`.
- Connections are now reset using `COM_CHANGE_USER` when pulled from the pool.
- Implemented `SingleResultSet` behavior.
- Implemented support of unicode.
- Added char set mappings for utf-8 and ucs-2.
- Time fields overflow using bytefx .net mysql driver (Bug #4520)
- Modified time test in data type test fixture to check for time spans where hours > 24.
- Wrong string with backslash escaping in `ByteFx.Data.MySqlClient.MySqlParameter`. (Bug #4505)
- Added code to Parameter test case TestQuoting to test for backslashes.
- `MySqlCommandBuilder` fails with multi-word column names. (Bug #4486)
- Fixed bug in `TokenizeSql` where underscore would terminate character capture in parameter name.
- Added test case for spaces in column names.
- `MySqlDataReader.GetBytes` do not work correctly. (Bug #4324)
- Added `GetBytes()` test case to `DataReader` test fixture.
- Now reading all server variables in `InternalConnection.Configure` into `Hashtable`.
- Now using `string[]` for index map in `CharSetMap`.
- Added CRInSQL test case for carriage returns in SQL.

- Setting maxPacketSize to default value in `Driver.ctor`.
- Setting `MySqlDbType` on a parameter doesn't set generic type. (Bug #4442)
- Removed obsolete data types `Long` and `LongLong`.
- Overflow exception thrown when using "use pipe" on connection string. (Bug #4071)
- Changed "use pipe" keyword to "pipe name" or just "pipe".
- Enable reading multiple resultsets from a single query.
- Added flags attribute to `ServerStatusFlags` enum.
- Changed name of `ServerStatus` enum to `ServerStatusFlags`.
- Inserted data row doesn't update properly.
- Error processing show create table. (Bug #4074)
- Change `Packet.ReadLenInteger` to `ReadPackedLong` and added `packet.ReadPackedInteger` that always reads integers packed with 2,3,4.
- Added `syntax.cs` test fixture to test various SQL syntax bugs.
- Improper handling of time values. Now time value of 00:00:00 is not treated as null. (Bug #4149)
- Moved all test suite files into `TestSuite` folder.
- Fixed bug where null column would move the result packet pointer backward.
- Added new nant build script.
- Clear tablename so it will be regen'ed properly during the next `GenerateSchema`. (Bug #3917)
- `GetValues` was always returning zero and was also always trying to copy all fields rather than respecting the size of the array passed in. (Bug #3915)
- Implemented shared memory access protocol.
- Implemented prepared statements for MySQL 4.1.
- Implemented stored procedures for MySQL 5.0.
- Renamed `MySqlInternalConnection` to `InternalConnection`.
- SQL is now parsed as chars, fixes problems with other languages.
- Added logging and allow batch connection string options.
- `RowUpdating` event not set when setting the `DataAdapter` property. (Bug #3888)
- Fixed bug in char set mapping.
- Implemented 4.1 authentication.
- Improved open/auth code in driver.
- Improved how connection bits are set during connection.
- Database name is now passed to server during initial handshake.
- Changed namespace for client to `MySql.Data.MySqlClient`.
- Changed assembly name of client to `MySql.Data.dll`.
- Changed license text in all source files to GPL.
- Added the `MySqlClient.build` Nant file.
- Removed the mono batch files.

- Moved some of the unused files into notused folder so nant build file can use wildcards.
- Implemented shared memory access.
- Major revamp in code structure.
- Prepared statements now working for MySql 4.1.1 and later.
- Finished implementing auth for 4.0, 4.1.0, and 4.1.1.
- Changed namespace from `MySQL.Data.MySQLClient` back to `MySql.Data.MySqlClient`.
- Fixed bug in `CharSetMapping` where it was trying to use text names as ints.
- Changed namespace to `MySQL.Data.MySQLClient`.
- Integrated auth changes from UC2004.
- Fixed bug where calling any of the GetXXX methods on a datareader before or after reading data would not throw the appropriate exception (thanks Luca Morelli).
- Added `TimeSpan` code in parameter.cs to properly serialize a timespan object to mysql time format (thanks Gianluca Colombo).
- Added `TimeStamp` to parameter serialization code. Prevented `DataAdapter` updates from working right (thanks Michael King).
- Fixed a misspelling in `MySqlHelper.cs` (thanks Patrick Kristiansen).

D.3.13. Changes in MySQL Connector/Net Version 0.76

- Driver now using charset number given in handshake to create encoding.
- Changed command editor to point to `MySqlClient.Design`.
- Fixed bug in `Version.isAtLeast`.
- Changed `DBConnectionString` to support changes done to `MySqlConnectionString`.
- Removed `SqlCommandEditor` and `DataAdapterPreviewDialog`.
- Using new long return values in many places.
- Integrated new `CompressedStream` class.
- Changed `ConnectionString` and added attributes to permit it to be used in `MySqlClient.Design`.
- Changed `packet.cs` to support newer lengths in `ReadLenInteger`.
- Changed other classes to use new properties and fields of `MySqlConnectionString`.
- `ConnectionInternal` is now using PING to see whether the server is available.
- Moved toolbox bitmaps into resource folder.
- Changed `field.cs` to permit values to come directly from row buffer.
- Changed to use the new driver.Send syntax.
- Using a new packet queueing system.
- Started work handling the "broken" compression packet handling.
- Fixed bug in `StreamCreator` where failure to connect to a host would continue to loop infinitely (thanks Kevin Casella).
- Improved connectstring handling.
- Moved designers into Pro product.
- Removed some old commented out code from `command.cs`.

- Fixed a problem with compression.
- Fixed connection object where an exception throw prior to the connection opening would not leave the connection in the connecting state (thanks Chris Cline).
- Added GUID support.
- Fixed sequence out of order bug (thanks Mark Reay).

D.3.14. Changes in MySQL Connector/Net Version 0.75

- Enum values now supported as parameter values (thanks Philipp Sumi).
- Year data type now supported.
- Fixed compression.
- Fixed bug where a parameter with a `TimeSpan` as the value would not serialize properly.
- Fixed bug where default constructor would not set default connection string values.
- Added some XML comments to some members.
- Work to fix/improve compression handling.
- Improved `ConnectionString` handling so that it better matches the standard set by `SqlClient`.
- A `MySqlException` is now thrown if a user name is not included in the connection string.
- Localhost is now used as the default if not specified on the connection string.
- An exception is now thrown if an attempt is made to set the connection string while the connection is open.
- Small changes to `ConnectionString` docs.
- Removed `MultiHostStream` and `MySqlStream`. Replaced it with `Common/StreamCreator`.
- Added support for Use Pipe connection string value.
- Added Platform class for easier access to platform utility functions.
- Fixed small pooling bug where new connection was not getting created after `IsAlive` fails.
- Added `Platform.cs` and `StreamCreator.cs`.
- Fixed `Field.cs` to properly handle 4.1 style timestamps.
- Changed `Common.Version` to `Common.DBVersion` to avoid name conflict.
- Fixed `field.cs` so that text columns return the right field type.
- Added `MySqlError` class to provide some reference for error codes (thanks Geert Veenstra).

D.3.15. Changes in MySQL Connector/Net Version 0.74

- Added Unix socket support (thanks Mohammad DAMT).
- Only calling `Thread.Sleep` when no data is available.
- Improved escaping of quote characters in parameter data.
- Removed misleading comments from `parameter.cs`.
- Fixed pooling bug.
- Fixed `ConnectionString` editor dialog (thanks marco p (pomarc)).

- `UserId` now supported in connection strings (thanks Jeff Neeley).
- Attempting to create a parameter that is not input throws an exception (thanks Ryan Gregg).
- Added much documentation.
- Checked in new `MultiHostStream` capability. Big thanks to Dan Guisinger for this. he originally submitted the code and idea of supporting multiple machines on the connect string.
- Added a lot of documentation.
- Fixed speed issue with 0.73.
- Changed to Thread.Sleep(0) in MySqlDataStream to help optimize the case where it doesn't need to wait (thanks Todd German).
- Prepopulating the idlepools to `MinPoolSize`.
- Fixed `MySqlPool` deadlock condition as well as stupid bug where CreateNewPooledConnection was not ever adding new connections to the pool. Also fixed `MySqlStream.ReadBytes` and `ReadByte` to not use `TicksPerSecond` which does not appear to always be right. (thanks Matthew J. Peddlesden)
- Fix for precision and scale (thanks Matthew J. Peddlesden).
- Added `Thread.Sleep(1)` to stream reading methods to be more cpu friendly (thanks Sean McGinnis).
- Fixed problem where `ExecuteReader` would sometime return null (thanks Lloyd Dupont).
- Fixed major bug with null field handling (thanks Naucki).
- Enclosed queries for `max_allowed_packet` and `characterset` inside try catch (and set defaults).
- Fixed problem where socket was not getting closed properly (thanks Steve!).
- Fixed problem where `ExecuteNonQuery` was not always returning the right value.
- Fixed `InternalConnection` to not use `@@session.max_allowed_packet` but use `@@max_allowed_packet`. (Thanks Miguel)
- Added many new XML doc lines.
- Fixed SQL parsing to not send empty queries (thanks Rory).
- Fixed problem where the reader was not unpeeking the packet on close.
- Fixed problem where user variables were not being handled (thanks Sami Vaaraniemi).
- Fixed loop checking in the MySqlPool (thanks Steve M. Brown)
- Fixed `ParameterCollection.Add` method to match `SqlClient` (thanks Joshua Mouch).
- Fixed `ConnectionString` parsing to handle no and yes for boolean and not lowercase values (thanks Naucki).
- Added `InternalConnection` class, changes to pooling.
- Implemented Persist Security Info.
- Added `security.cs` and `version.cs` to project
- Fixed `DateTime` handling in `Parameter.cs` (thanks Burkhard Perkens-Golomb).
- Fixed parameter serialization where some types would throw a cast exception.
- Fixed `DataReader` to convert all returned values to prevent casting errors (thanks Keith Murray).
- Added code to `Command.ExecuteReader` to return null if the initial SQL statement throws an exception (thanks Burkhard Perkens-Golomb).
- Fixed `ExecuteScalar` bug introduced with restructure.
- Restructure to permit `LOCAL DATA INFILE` and better sequencing of packets.

- Fixed several bugs related to restructure.
- Early work done to support more secure passwords in MySQL 4.1. Old passwords in 4.1 not supported yet.
- Parameters appearing after system parameters are now handled correctly (Adam M. (adammil)).
- Strings can now be assigned directly to blob fields (Adam M.).
- Fixed float parameters (thanks Pent).
- Improved Parameter constructor and `ParameterCollection.Add` methods to better match SqlClient (thanks Joshua Mouch).
- Corrected `Connection.CreateCommand` to return a `MySqlCommand` type.
- Fixed connection string designer dialog box problem (thanks Abraham Guyt).
- Fixed problem with sending commands not always reading the response packet (thanks Joshua Mouch).
- Fixed parameter serialization where some blobs types were not being handled (thanks Sean McGinnis).
- Removed spurious `MessageBox.show` from `DataReader` code (thanks Joshua Mouch).
- Fixed a nasty bug in the split SQL code (thanks everyone!).

D.3.16. Changes in MySQL Connector/Net Version 0.71

- Fixed bug in `MySqlStream` where too much data could attempt to be read (thanks Peter Belbin)
- Implemented `HasRows` (thanks Nash Pherson).
- Fixed bug where tables with more than 252 columns cause an exception (thanks Joshua Kessler).
- Fixed bug where SQL statements ending in ; would cause a problem (thanks Shane Krueger).
- Fixed bug in driver where error messages were getting truncated by 1 character (thanks Shane Krueger).
- Made `MySqlException` serializable (thanks Mathias Hasselmann).

D.3.17. Changes in MySQL Connector/Net Version 0.70

- Updated some of the character code pages to be more accurate.
- Fixed problem where readers could be opened on connections that had readers open.
- Moved test to separate assembly `MySqlClientTests`.
- Fixed stupid problem in driver with sequence out of order (Thanks Peter Belbin).
- Added some pipe tests.
- Increased default max pool size to 50.
- Compiles with Mono 0-24.
- Fixed connection and data reader dispose problems.
- Added `String` data type handling to parameter serialization.
- Fixed sequence problem in driver that occurred after thrown exception (thanks Burkhard Perkens-Golomb).
- Added support for `CommandBehavior.SingleRow` to `DataReader`.
- Fixed command SQL processing so quotation marks are better handled (thanks Theo Spears).
- Fixed parsing of double, single, and decimal values to account for non-English separators. You still have to use the right syntax if you using hard coded SQL, but if you use parameters the code will convert floating point types to use '.' appropriately internal

both into the server and out.

- Added `MySqlStream` class to simplify timeouts and driver coding.
- Fixed `DataReader` so that it is closed properly when the associated connection is closed. [thanks smishra]
- Made client more SqlClient compliant so that DataReaders have to be closed before the connection can be used to run another command.
- Improved `DBNull.Value` handling in the fields.
- Added several unit tests.
- Fixed `MySqlException` base class.
- Improved driver coding
- Fixed bug where NextResult was returning false on the last resultset.
- Added more tests for MySQL.
- Improved casting problems by equating unsigned 32bit values to Int64 and unsigned 16bit values to Int32, and so forth.
- Added new constructor for `MySqlParameter` for (name, type, size, srccol)
- Fixed bug in `MySqlDataReader` where it didn't check for null fieldlist before returning field count.
- Started adding `MySqlClient` unit tests (added `MySqlClient/Tests` folder and some test cases).
- Fixed some things in Connection String handling.
- Moved `INIT_DB` to `MySqlPool`. I may move it again, this is in preparation of the conference.
- Fixed bug inside `CommandBuilder` that prevented inserts from happening properly.
- Reworked some of the internals so that all three execute methods of Command worked properly.
- Fixed many small bugs found during benchmarking.
- The first cut of `CoonectionPooling` is working. "min pool size" and "max pool size" are respected.
- Work to enable multiple resultsets to be returned.
- Character sets are handled much more intelligently now. The driver queries MySQL at startup for the default character set. That character set is then used for conversions if that code page can be loaded. If not, then the default code page for the current OS is used.
- Added code to save the inferred type in the name,value constructor of `Parameter`.
- Also, inferred type if value of null parameter is changed using `Value` property.
- Converted all files to use proper Camel case. MySQL is now MySql in all files. PgSQL is now PgSql.
- Added attribute to PgSql code to prevent designer from trying to show.
- Added `MySQLDbType` property to Parameter object and added proper conversion code to convert from `DbType` to `MySQLDbType`).
- Removed unused `ObjectToString` method from `MySQLParameter.cs`.
- Fixed `Add(..)` method in `ParameterCollection` so that it doesn't use `Add(name, value)` instead.
- Fixed `IndexOf` and `Contains` in `ParameterCollection` to be aware that parameter names are now stored without @.
- Fixed `Command.ConvertSQLToBytes` so it only permits characters that can be in MySQL variable names.
- Fixed `DataReader` and `Field` so that blob fields read their data from `Field.cs` and `GetBytes` works right.
- Added simple query builder editor to `CommandText` property of `MySQLCommand`.
- Fixed `CommandBuilder` and `Parameter` serialization to account for Parameters not storing @ in their names.

- Removed `MySQLFieldType` enum from Field.cs. Now using `MySQLDbType` enum.
- Added `Designer` attribute to several classes to prevent designer view when using VS.Net.
- Fixed Initial catalog typo in `ConnectionString` designer.
- Removed 3 parameter constructor for `MySQLParameter` that conflicted with (name, type, value).
- Changed `MySQLParameter` so `paramName` is now stored without leading @ (this fixed null inserts when using designer).
- Changed `TypeConverter` for `MySQLParameter` to use the constructor with all properties.

D.3.18. Changes in MySQL Connector/Net Version 0.68

- Fixed sequence issue in driver.
- Added `DbParametersEditor` to make parameter editing more like `SqlClient`.
- Fixed `Command` class so that parameters can be edited using the designer
- Update connection string designer to support `Use Compression` flag.
- Fixed string encoding so that European characters will work correctly.
- Creating base classes to aid in building new data providers.
- Added support for UID key in connection string.
- Field, parameter, command now using DBNull.Value instead of null.
- `CommandBuilder` using `DBNull.Value`.
- `CommandBuilder` now builds insert command correctly when an auto_insert field is not present.
- Field now uses typeof keyword to return `System.Types` (performance).

D.3.19. Changes in MySQL Connector/Net Version 0.65

- `MySQLCommandBuilder` now implemented.
- Transaction support now implemented (not all table types support this).
- `GetSchemaTable` fixed to not use xsd (for Mono).
- Driver is now Mono-compatible.
- TIME data type now supported.
- More work to improve Timestamp data type handling.
- Changed signatures of all classes to match corresponding `SqlClient` classes.

D.3.20. Changes in MySQL Connector/Net Version 0.60

- Protocol compression using SharpZipLib (www.icsharpcode.net).
- Named pipes on Windows now working properly.
- Work done to improve `Timestamp` data type handling.
- Implemented `IEnumerable` on `DataReader` so `DataGrid` would work.

D.3.21. Changes in MySQL Connector/Net Version 0.50

- Speed increased dramatically by removing bugging network sync code.
- Driver no longer buffers rows of data (more ADO.Net compliant).
- Conversion bugs related to `TIMESTAMP` and `DATETIME` fields fixed.

D.4. MySQL Visual Studio Plugin Change History

> **Note**
>
> As of Connector/Net 5.1.2 (14 June 2007), the Visual Studio Plugin is part of the main Connector/Net package. For the change history for the Visual Studio Plugin, see Section D.3, “MySQL Connector/Net Change History”.

D.4.1. Changes in MySQL Visual Studio Plugin 1.0.3 (Not yet released)

Bugs Fixed

- DataSet wizard would show all tables instead of only the tables available within the selected database. (Bugs #26348)
- Running queries based on a stored procedure would cause the data set designer to terminate. (Bugs #26364)

D.4.2. Changes in MySQL Visual Studio Plugin 1.0.2 (Not yet released)

Bugs Fixed

- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/Net 5.0.2 must be installed. (Bug #23071)
- The Add Connection dialog of the Server Explorer would freeze when accessing databases with capitalized characters in their name. (Bug #24875)

D.4.3. Changes in MySQL Visual Studio Plugin 1.0.1 (04 October 2006)

This is a bug fix release to resolve an incompatibility issue with Connector/Net 5.0.1.

It is critical that this release only be used with Connector/Net 5.0.1. After installing Connector/Net 5.0.1, you will need to make a small change in your machine.config file. This file should be located at `%win%\Microsoft.Net\Framework\v2.0.50727\CONFIG\machine.config` (`%win%` should be the location of your Windows folder). Near the bottom of the file you will see a line like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data"/>
```

It needs to be changed to be like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data,
Version=5.0.1.0, Culture=neutral, PublicKeyToken=c5687fc88969c44d"/>
```

Version 1.0.1 has no changelog entries.

D.4.4. Changes in MySQL Visual Studio Plugin 1.0.0 (04 October 2006)

Bugs Fixed

- DDEX (Data Designer Extensibility) compatibility.
- Ability to work with MySQL objects (tables, views, stored procedures, etc) from within Server Explorer.

D.5. MySQL Connector/J Change History

D.5.1. Changes in MySQL Connector/J 5.1.x

D.5.1.1. Changes in MySQL Connector/J 5.1.18 (04 October 2011)

Fixes bugs found since release 5.1.17.

Functionality Added or Changed

- Added the function `MYSQL_INDEX_TO_MYSQL_CHARSET` to retrieve the server charset name, using an index instead of parsing variables to `CharsetMapping.java`

Bugs Fixed

- The `LRUCache` implementation removed the eldest entry, rather than the least-recently accessed. (Bug #13036537)
- Changed `cacheCallableStatements` to `cacheCallableStmts` in `maxPerformance.properties`, to allow proper caching. (Bug #13036309)
- Added a new `ant` flag, `com.mysql.jdbc.junit.fork`, which controls whether `JUnit` will fork new processes.

  The value `on`: The default, and legacy behavior. Or `off`): Required for Windows, as otherwise `process fork failure` errors will result while running the test suite via `ant` on Windows. (Bug #12784170)
- Not putting a space between `VALUES()` and `ON DUPLICATE KEY UPDATE` causes connector/J to both (A) Rewrite the query, although it includes an `ON UPDATE` statement and (B) To generate the wrong query with multiple `ON DUPLICATE KEY` statements. (Bug #12565726)
- The `loadBalanceBlacklistTimeout` option was not functioning properly. Working connections were not being removed from the blacklist. (Bug #63135)
- Connector/J now guards against the condition where a call to `KILL QUERY` will kill the next query issued by the server, if no query is in process. (Bug #61501)
- The "old" warnings were returned when `Statement.getWarnings()` was called after `Statement.clearWarnings()`. (Bug #61866, Bug #12791594)
- Calling `Statement.cancel()` on a statement that isn't currently executing, will cause a later-executed query on the same connection to be unexpectedly canceled. The driver now guards against this condition, but it is an underlying server issue. The MySQL statement `KILL QUERY` (which is what the driver uses to implement `Statement.cancel()`) is rather non-deterministic, and thus the use of `Statement.cancel()` should be avoided if possible. (Bug #61501)
- A connection could not be established when the URL contained both `sessionVariables` and `characterEncoding`. (Bug #61201, Bug #12649557)
- Reverting changes made to `ConnectionImpl.java`, the `private boolean characterSetNamesMatches` function.

D.5.1.2. Changes in MySQL Connector/J 5.1.17 (07 July 2011)

Fixes bugs found since release 5.1.16.

Bugs Fixed

- `LIKE` was not optimized in then server when run against `INFORMATION_SCHEMA` tables and no wildcards were used. Databases/tables with `'_'` or `'%'` in their names (escaped or not) are handled by this code path, although slower, since it is rare to find these characters in table names in SQL. If there is a `'_'` or `'%'` in the string, `LIKE` takes care of that; otherwise, `'='` is now used instead. The only exception is the `information_schema` database, which is handled separately. The patch covers both `getTables()` and `getColumns()`. (Bug #61332)
- The first call to a stored procedure failed with “No Database Selected”. The workaround introduced in `DatabaseMetaData.getCallStmtParameterTypes` to fix the server bug where `SHOW CREATE PROCEDURE` was not respecting lowercase table names was misbehaving when the connection was not attached to a database and on case-insensitive operating systems. (Bug #61150)

- There was a concurrency bottleneck in Java's character set encoding/decoding when converting bytes to/from `String` values.

  Important

  No longer use `String.getBytes(...)`, or `new String(byte[]...)`. Use the `StringUtils` method instead.

  (Bug #61105)

D.5.1.3. Changes in MySQL Connector/J 5.1.16 (Not released)

Fixes bugs found since release 5.1.15.

Functionality Added or Changed

- The `Connection.isServerLocal()` method can now determine if a connection is against a server on the same host.

Bugs Fixed

- When auto-reconnect was used with `cacheServerConfiguration`, errors could occur when the host changed (in an HA setup, for example). (Bug #12325877)
- `DBMD.getTables` and `getColumns` fail with table names that contain a dot (like "`junk_[Sp:e,c/ C-h+a=.r]`"). The workaround is to use `useInformationSchema=True`. (Bug #11782297)
- `ResultSetRow.getTimestampFast` and `getTime` had invalid offsets. (Bug #60313)
- Fixed a bug where Connector/J would kill the matching `ConnectionID`, but on the wrong server. (Bug #54135)
- `wasNull` was not set for a `DATE` field with the value of `0000-00-00` in `getDate()`, although `zeroDateTimeBehavior` is defined as `convertToNull`. (Bug #57808)
- A bypassing of the server protocol bug, where the DB should be null-terminated whether it exists or not. This affects `COM_CHANGE_USER`. (Bug #54425)
- Fixed a timestamp offset bug in `com.mysql.jdbc.ResultSetRow.getTimestampFast()`. (Bug #60313, Bug #11890729)

D.5.1.4. Changes in MySQL Connector/J 5.1.15 (09 February 2011)

Fixes bugs found since release 5.1.14.

Bugs Fixed

- Optional logging class `com.mysql.jdbc.log.Log4JLogger` was not included in the source/binary package for 5.1.14.

  5.1.15 will ship with an SLF4J logger (which can then be plugged into Log4J). Unfortunately, it is not possible to ship a direct Log4J integration because the GPL is not compatible with Log4J's license. (Bug #59511, Bug #11766408)
- The hard-coded list of reserved words in Connector/J was not updated to reflect the list of reserved words in MySQL Server 5.5. (Bug #59224)
- MySqlProcedure accepted null arguments as parameters, however the JDBC meta data did not indicate that. (Bug #38367, Bug #11749186)
- Using Connector/J to connect from a z/OS machine to a MySQL Server failed when the database name to connect to was included in the connection URL. This was because the name was sent in z/OS default platform encoding, but the MySQL Server expected Latin1.

  It should be noted that when connecting from systems that do not use Latin1 as the default platform encoding, the following connection string options can be useful: `passwordCharacterEncoding=ASCII` and `characterEncoding=ASCII`. (Bug #18086, Bug #11745647)

D.5.1.5. Changes in MySQL Connector/J 5.1.14 (6th December 2010)

Fixes bugs found since release 5.1.13.

Functionality Added or Changed

- Connector/J's load-balancing functionality only allowed the following events to trigger failover:

  - Transaction commit/rollback
  - CommunicationExceptions
  - Matches to user-defined Exceptions using the loadBalanceSQLStateFailover, loadBalanceSQLExceptionSubclassFailover or loadBalanceExceptionChecker property.

  This meant that connections where auto-commit was enabled were not balanced, except for Exceptions, and this was problematic in the case of distribution of read-only work across slaves in a replication deployment.

  The ability to load-balance while auto-commit is enabled has now been added to Connector/J. This introduces two new properties:

  1. loadBalanceAutoCommitStatementThreshold - defines the number of matching statements which will trigger the driver to (potentially) swap physical server connections. The default value (0) retains the previously-established behavior that connections with auto-commit enabled are never balanced.
  2. loadBalanceAutoCommitStatementRegex - the regular expression against which statements must match. The default value (blank) matches all statements.

  Load-balancing will be done after the statement is executed, before control is returned to the application. If rebalancing fails, the driver will silently swallow the resulting Exception (as the statement itself completed successfully). (Bug #55723)

Bugs Fixed

- Added diagnostic information to `SQLException` messages that are caused by usage of a closed load-balanced connection, to help clarify the root cause of a connection closure. (Bug #56200)
- Connection failover left slave/secondary in read-only mode. Failover attempts between two read-write masters did not properly set `this.currentConn.setReadOnly(false)`. (Bug #58706)
- Connector/J mapped both 3-byte and 4-byte UTF8 encodings to the same Java UTF8 encoding.

  To use 3-byte UTF8 with Connector/J set `characterEncoding=utf8` and set `useUnicode=true` in the connection string.

  To use 4-byte UTF8 with Connector/J configure the MySQL server with `character_set_server=utf8mb4`. Connector/J will then use that setting as long as `characterEncoding` has not been set in the connection string. This is equivalent to autodetection of the character set. (Bug #58232)
- The `CallableStatementRegression` test suite failed with a Null Pointer Exception because the `OUT` parameter in the `I__S.PARAMETERS` table had no name, that is `COLUMN_NAME` had the value `NULL`. (Bug #58232)
- Attempting to use JDBC4 functions on `Connection` objects resulted in errors being generated:

```
Exception in thread "main" java.lang.AbstractMethodError:
com.mysql.jdbc.LoadBalancedMySQLConnection.createBlob()Ljava/sql/Blob;
   at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method)
   at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:39)
   at
sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:25)
   at java.lang.reflect.Method.invoke(Method.java:597)
   at
com.mysql.jdbc.LoadBalancingConnectionProxy.invoke(LoadBalancingConnectionProxy.java:476)
   at $Proxy0.createBlob(Unknown Source)
```

  (Bug #56099)
- `DatabaseMetaData.supportsMultipleResultSets()` was hard-coded to return `false`, even though Connector/J supports multiple result sets. (Bug #57380)
- Invoking a stored procedure containing output parameters by its full name, where the procedure was located in another database, generated the following exception:

```
Parameter index of 1 is out of range (1, 0)
```

(Bug #57022)

- Using the `useOldUTF8Behavior` parameter failed to set the connection character set to `latin1` as required.

  In versions prior to 5.1.3, the handshake was done using `latin1`, and while there was logic in place to explicitly set the character set after the handshake was complete, this was bypassed when `useOldUTF8Behavior` was true. This was not a problem until 5.1.3, when the handshake was modified to use `utf8`, but the logic continued to allow the character set configured during that handshake process to be retained for later use. As a result, `useOldUTF8Behavior` effectively failed. (Bug #57262)

- Leaving Trust/ClientCertStoreType properties unset caused an exception to be thrown when connecting with `useSSL=true`, as no default was used. (Bug #56955)

- When a JDBC client disconnected from a remote server using `Connection.close()`, the TCP connection remained in the `TIME_WAIT` state on the server side, rather than on the client side. (Bug #56979)

- When load-balanced connections swap servers, certain session state was copied from the previously active connection to the newly-selected connection. State synchronized included:

  - Auto-commit state
  - Transaction isolation state
  - Current schema/catalog

  However, the read-only state was not synchronized, which caused problems if a write was attempted on a read-only connection. (Bug #56706)

- When using Connector/J configured for failover (jdbc:mysql://host1,host2,... URLs), the non-primary servers re-balanced when the transactions on the master were committed or rolled-back. (Bug #56429)

- An unhandled Null Pointer Exception (NPE) was generated in `DatabaseMetaData.java` when calling an incorrectly cased function name where no permission to access `mysql.proc` was available.

  In addition to catching potential NPEs, a guard against calling JDBC functions with `db_name.proc_name` notation was also added. (Bug #56305)

D.5.1.6. Changes in MySQL Connector/J 5.1.13 (24 June 2010)

Fixes bugs found since release 5.1.12.

Functionality Added or Changed

- Connector/J did not support `utf8mb4` for servers 5.5.2 and newer.

  Connector/J now auto-detects servers configured with `character_set_server=utf8mb4` or treats the Java encoding `utf-8` passed using `characterEncoding=...` as `utf8mb4` in the `SET NAMES=` calls it makes when establishing the connection. (Bug #54175)

Bugs Fixed

- When the `allowMultiQueries` connection string option was set to `true`, a call to `Statement.executeBatch()` scanned the query for escape codes, even though `setEscapeProcessing(false)` had been called previously. (Bug #51704)

- The method `unSafeStatementInterceptors()` contained an erroneous line of code, which resulted in the interceptor being called, but the result being thrown away. (Bug #53041)

- There was a performance regression of roughly 25% between r906 and r907, which appeared to be caused by pushing the Proxy down to the I/O layer. (Bug #52534)

- In the file `DatabaseMetadata.java`, the function `private void getCallStmtParameterTypes` failed if the parameter was defined over more than one line by using the '\n' character. (Bug #52167)

- The catalog parameter, `PARAM_CAT`, was not correctly processed when calling for metadata with `getMetaData()` on stored procedures. This was because `PARAM_CAT` was hardcoded in the code to `NULL`. In the case where `nullcatalog-`

meanscurrent was true, which is its default value, a crash did not occur, but the metadata returned was for the stored procedures from the catalog currently attached to. If, however, nullcatalogmeanscurrent was set to false then a crash resulted.

Connector/J has been changed so that when NULL is passed as PARAM_CAT it will not crash when nullcatalog-meanscurrent is false, but rather iterate all catalogs in search of stored procedures. This means that PARAM_CAT is no longer hardcoded to NULL (see Bug #51904). (Bug #51912)

- Logic in implementations of LoadBalancingConnectionProxy and LoadBalanceStrategy behaved differently as to which SQLExceptions trigger failover to a new host. The former looked at the first two characters of the SQLState:

```
if (sqlState.startsWith("08"))
...
```

The latter used a different test:

```
if (sqlEx instanceof CommunicationsException
  || "08S01".equals(sqlEx.getSQLState())) {
...
```

This meant it was possible for a new Connection object to throw an Exception when the first selected host was unavailable. This happened because MySqlIO.createNewIO() could throw an SQLException with a SQLState of "08001", which did not trigger the "try another host" logic in the LoadBalanceStrategy implementations, so an Exception was thrown after having only attempted connecting to a single host. (Bug #52231)

- A load balanced Connection object with multiple open underlying physical connections rebalanced on commit(), rollback(), or on a communication exception, without validating the existing connection. This caused a problem when there was no pinging of the physical connections, using queries starting with "/* ping */", to ensure they remained active. This meant that calls to Connection.commit() could throw a SQLException. This did not occur when the transaction was actually committed; it occurred when the new connection was chosen and the driver attempted to set the auto-commit or transaction isolation state on the newly chosen physical connection. (Bug #51783)

- The rollback() method could fail to rethrow a SQLException if the server became unavailable during a rollback. The errant code only rethrew when ignoreNonTxTables was true and the exception did not have the error code 1196, SQLError.ER_WARNING_NOT_COMPLETE_ROLLBACK. (Bug #51776)

- Objects created by ConnectionImpl, such as prepared statements, hold a reference to the ConnectionImpl that created them. However, when the load balancer picked a new connection, it did not update the reference contained in, for example, the PreparedStatement. This resulted in inserts and updates being directed to invalid connections, while commits were directed to the new connection. This resulted in silent data loss. (Bug #51643)

- When a StatementInterceptor was used and an alternate ResultSet was returned from preProcess(), the original statement was still executed. (Bug #51666)

- jdbc:mysql:loadbalance:// would connect to the same host, even though loadBalanceStrategy was set to a value of random, and multiple hosts were specified. (Bug #51266)

- An unexpected exception when trying to register OUT parameters in CallableStatement.

  Sometimes Connector/J was not able to register OUT parameters for CallableStatements. (Bug #43576)

D.5.1.7. Changes in MySQL Connector/J 5.1.12 (18 February 2010)

Fixes bugs found since release 5.1.11.

Bugs Fixed

- The catalog parameter was ignored in the DatabaseMetaData.getProcedure() method. It returned all procedures in all databases. (Bug #51022)

- A call to DatabaseMetaData.getDriverVersion() returned the revision as mysql-connector-java-5.1.11 (Revision: ${svn.Revision}). The variable ${svn.Revision} was not replaced by the SVN revision number. (Bug #50288)

D.5.1.8. Changes in MySQL Connector/J 5.1.11 (21 January 2010)

Fixes bugs found since release 5.1.10.

Functionality Added or Changed

- Replication connections, those with URLs that start with jdbc:mysql:replication, now use a jdbc:mysql:loadbalance connection for the slave pool. This means that it is possible to set load balancing properties such as `loadBalanceBlacklistTimeout` and `loadBalanceStrategy` to choose a mechanism for balancing the load, and failover or fault tolerance strategy for the slave pool. (Bug #49537)

Bugs Fixed

- `NullPointerException` sometimes occurred in `invalidateCurrentConnection()` for load-balanced connections. (Bug #50288)
- For pooled connections, Connector/J did not process the session variable `time_zone` when set using the URL, resulting in incorrect timestamp values being stored. (Bug #49700)
- The `deleteRow` method caused a full table scan, when using an updatable cursor and a multibyte character set. (Bug #49745)
- The `ExceptionInterceptor` class did not provide a `Connection` context. (Bug #49607)
- Ping left closed connections in the liveConnections map, causing subsequent Exceptions when that connection was used. (Bug #48605)
- Using `MysqlConnectionPoolDataSource` with a load-balanced URL generated exceptions of type `ClassCastException`:

```
ClassCastException in MysqlConnectionPoolDataSource
Caused by: java.lang.ClassCastException: $Proxy0
   at
com.mysql.jdbc.jdbc2.optional.MysqlConnectionPoolDataSource.getPooledConnection(MysqlConne
ctionPoolDataSource.java:80)
```

```
java.lang.ClassCastException: $Proxy2
 at com.mysql.jdbc.jdbc2.optional.StatementWrapper.executeQuery(StatementWrapper.java:744)
```

  (Bug #48486)

- The implementation for load-balanced `Connection` used a proxy, which delegated method calls, including `equals()` and `hashCode()`, to underlying `Connection` objects. This meant that successive calls to `hashCode()` on the same object potentially returned different values, if the proxy state had changed such that it was utilizing a different underlying connection. (Bug #48442)
- The batch rewrite functionality attempted to identify the start of the `VALUES` list by looking for “VALUES ” (with trailing space). However, valid MySQL syntax permits `VALUES` to be followed by whitespace or an opening parenthesis:

```
INSERT INTO tbl VALUES
(1);

INSERT INTO tbl VALUES(1);
```

  Queries written with the above formats did not therefore gain the performance benefits of the batch rewrite. (Bug #48172)

- A PermGen memory leaked was caused by the Connector/J statement cancellation timer (`java.util.Timer`). When the application was unloaded the cancellation timer did not terminate, preventing the ClassLoader from being garbage collected. (Bug #36565)
- With the connection string option `noDatetimeStringSync` set to `true`, and server-side prepared statements enabled, the following exception was generated if an attempt was made to obtain, using `ResultSet.getString()`, a datetime value containing all zero components:

```
java.sql.SQLException: Value '0000-00-00' can not be represented as java.sql.Date
```

  (Bug #32525)

D.5.1.9. Changes in MySQL Connector/J 5.1.10 (23 September 2009)

Fixes bugs found since release 5.1.9.

Bugs Fixed

- The `DriverManager.getConnection()` method ignored a non-standard port if it was specified in the JDBC connection string. Connector/J always used the standard port 3306 for connection creation. For example, if the string was `jdbc:mysql://localhost:6777`, Connector/J would attempt to connect to port 3306, rather than 6777. (Bug #47494)

D.5.1.10. Changes in MySQL Connector/J 5.1.9 (21 September 2009)

Bugs Fixed

- When Connector/J encountered an error condition that caused it to create a `CommunicationsException`, it tried to build a friendly error message that helped diagnose what was wrong. However, if there had been no network packets received from the server, the error message contained the following incorrect text:

```
The last packet successfully received from the server was 1,249,932,468,916 milliseconds
ago.  The last packet sent successfully to the server was 0 milliseconds ago.
```

  (Bug #46637)

- In the class `com.mysql.jdbc.jdbc2.optional.SuspendableXAConnection`, which is used when `pinGlobalTxToPhysicalConnection=true`, there is a static map (XIDS_TO_PHYSICAL_CONNECTIONS) that tracks the Xid with the XAConnection, however this map was not populated. The effect was that the `SuspendableXAConnection` was never pinned to the real XA connection. Instead it created new connections on calls to `start`, `end`, `resume`, and `prepare`. (Bug #46925)

- When using the ON DUPLICATE KEY UPDATE functionality together with the rewriteBatchedStatements option set to true, an exception was generated when trying to execute the prepared statement:

```
INSERT INTO config_table (modified,id_) VALUES (?,?) ON DUPLICATE KEY UPDATE modified=?
```

  The exception generated was:

```
java.sql.SQLException: Parameter index out of range (3 > number of parameters, which is
2).
  at com.sag.etl.job.processors.JdbcInsertProcessor.flush(JdbcInsertProcessor.java:135)
......
Caused by: java.sql.SQLException: Parameter index out of range (3 > number of parameters,
which is 2).

  at com.sag.etl.job.processors.JdbcInsertProcessor.flush(JdbcInsertProcessor.java:131)
  ... 16 more
```

  (Bug #46788)

- Accessing result set columns by name after the result set had been closed resulted in a NullPointerException instead of a SQLException. (Bug #41484)

- The `getSuperTypes` method returned a result set with incorrect names for the first two columns. The name of the first column in the result set was expected to be `TYPE_CAT` and that of the second column `TYPE_SCHEM`. The method however returned the names as `TABLE_CAT` and `TABLE_SCHEM` for first and second column respectively. (Bug #44508)

- Calling `ResultSet.deleteRow()` on a table with a primary key of type `BINARY(8)` silently failed to delete the row, but only in some repeatable cases. The generated `DELETE` statement generated corrupted part of the primary key data. Specifically, one of the bytes was changed from 0x90 to 0x9D, although the corruption appeared to be different depending on whether the application was run on Windows or Linux. (Bug #43759)

- SQLException for data truncation error gave the error code as 0 instead of 1265. (Bug #44324)

- `QueryTimeout` did not work for batch statements waiting on a locked table.

  When a batch statement was issued to the server and was forced to wait because of a locked table, Connector/J only terminated the first statement in the batch when the timeout was exceeded, leaving the rest hanging. (Bug #34555)

- The `parseURL` method in class `com.mysql.jdbc.Driver` did not work as expected. When given a URL such as "jdbc:mysql://www.mysql.com:12345/my_database" to parse, the property `PORT_PROPERTY_KEY` was found to be `null` and the `HOST_PROPERTY_KEY` property was found to be "www.mysql.com:12345".

  > **Note**
  >
  > Connector/J has been fixed so that it will now always fill in the `PORT` property (using 3306 if not specified), and the `HOST` property (using `localhost` if not specified) when `parseURL()` is called. The driver also parses a list of hosts into `HOST.n` and `PORT.n` properties as well as adding a property `NUM_HOSTS` for the number of hosts it has found. If a list of hosts is passed to the driver, `HOST` and `PORT` will be set to the values given by `HOST.1` and `PORT.1` respectively. This change has centralized and cleaned up a large section of code used to generate lists of hosts, both for load-balanced and fault tolerant connections and their tests.

  (Bug #32216)

- Attempting to delete rows using `ResultSet.deleteRow()` did not delete rows correctly. (Bug #27431)

- The `setDate` method silently ignored the Calendar parameter. The code was implemented as follows:

```
public void setDate(int parameterIndex, java.sql.Date x, Calendar cal) throws SQLException {
   setDate(parameterIndex, x);
}
```

  From reviewing the code it was apparent that the Calendar parameter `cal` was ignored. (Bug #23584)

D.5.1.11. Changes in MySQL Connector/J 5.1.8 (16 July 2009)

Bugs Fixed

- Calling `Connection.serverPreparedStatement()` variants that do not take result set type or concurrency arguments returned statements that produced result sets with incorrect defaults, namely `TYPE_SCROLL_SENSITIVE`. (Bug #45171)

- The reported milliseconds since the last server packets were received/sent was incorrect by a factor of 1000. For example, the following method call:

```
SQLError.createLinkFailureMessageBasedOnHeuristics(
(ConnectionImpl) this.conn,
System.currentTimeMillis() - 1000,
System.currentTimeMillis() - 2000,
e,
false);
```

  returned the following string:

```
The last packet successfully received from the server
was 2 milliseconds ago. The last packet sent successfully to the
server was 1 milliseconds ago.
```

  (Bug #45419)

- The method `Statement.getGeneratedKeys()` did not return values for `UNSIGNED BIGINTS` with values greater than `Long.MAX_VALUE`.

  Unfortunately, because the server does not tell clients what TYPE the auto increment value is, the driver cannot consistently return BigIntegers for the result set returned from `getGeneratedKeys()`, it will only return them if the value is greater than `Long.MAX_VALUE`. If your application needs this consistency, it will need to check the class of the return value from `.getObject()` on the ResultSet returned by `Statement.getGeneratedKeys()` and if it is not a BigInteger, create one based on the `java.lang.Long` that is returned. (Bug #43196)

- A statement interceptor received the incorrect parameters when used with a batched statement. (Bug #39426)

- When using Connector/J 5.1.7 to connect to MySQL Server 4.1.18 the following error message was generated:

```
Thu Dec 11 17:38:21 PST 2008 WARN: Invalid value {1} for server variable named {0},
falling back to sane default of {2}
```

  This occurred with MySQL Server version that did not support `auto_increment_increment`. The error message should not have been generated. (Bug #41416)

- The `RETURN_GENERATED_KEYS` flag was being ignored. For example, in the following code the `RETURN_GENERATED_KEYS` flag was ignored:

```
PreparedStatement ps = connection.prepareStatement("INSERT INTO table
  values(?,?)",PreparedStatement.RETURN_GENERATED_KEYS);
```

  (Bug #41448)

- Using Connector/J 5.1.6 the method `ResultSet.getObject` returned a `BYTE[]` for following:

```
SELECT TRIM(rowid) FROM tbl
```

  Where `rowid` had a type of `INT(11) PRIMARY KEY AUTO_INCREMENT`.

  The expected return type was one of `CHAR`, `VARCHAR`, `CLOB`, however, a `BYTE[]` was returned.

  Further, adding `functionsNeverReturnBlobs=true` to the connection string did not have any effect on the return type. (Bug #38387)

- Connector/J generated an unhandled `StringIndexOutOfBoundsException`:

```
java.lang.StringIndexOutOfBoundsException: String index out of range: -1
at java.lang.String.substring(String.java:1938)
at com.mysql.jdbc.EscapeProcessor.processTimeToken(EscapeProcessor.java:353)
at com.mysql.jdbc.EscapeProcessor.escapeSQL(EscapeProcessor.java:257)
at com.mysql.jdbc.StatementImpl.executeUpdate(StatementImpl.java:1546)

  (Bug #42253)

- When using `rewriteBatchedStatements=true` with:

```
INSERT INTO table_name_values (...) VALUES (...)
```

  Query rewriting failed because “values” at the end of the table name was mistaken for the reserved keyword. The error generated was as follows:

```
testBug40439(testsuite.simple.TestBug40439)java.sql.BatchUpdateException: You have an
error in your SQL syntax; check the manual that corresponds to your MySQL server version
for the right syntax to use near 'values (2,'toto',2),(id,data, ordr) values
(3,'toto',3),(id,data, ordr) values (' at line 1

```

  (Bug #40439)

- Error message strings contained variable values that were not expanded. For example:

```
Mon Nov 17 11:43:18 JST 2008 WARN: Invalid value {1} for server variable named {0},
falling back to sane default of {2}
```

  (Bug #40772)

- When accessing a result set column by name using `ResultSetImpl.findColumn()` an exception was generated:

```
java.lang.NullPointerException
at com.mysql.jdbc.ResultSetImpl.findColumn(ResultSetImpl.java:1103)
at com.mysql.jdbc.ResultSetImpl.getShort(ResultSetImpl.java:5415)

```

  (Bug #41484)

- If there was an apostrophe in a comment in a statement that was being sent through Connector/J, the apostrophe was still recog-

nized as a quote and put the state machine in `EscapeTokenizer` into the `inQuotes` state. This led to further parse errors.

For example, consider the following statement:

```
String sql = "-- Customer's zip code will be fixed\n" +
  "update address set zip_code = 99999\n" +
  "where not regexp '^[0-9]{5}([[.-.]])?([0-9]{4})?$'";
```

When passed through Connector/J, the `EscapeTokenizer` did not recognize that the first apostrophe was in a comment and thus set `inQuotes` to true. When that happened, the quote count was incorrect and thus the regular expression did not appear to be in quotation marks. With the parser not detecting that the regular expression was in quotation marks, the curly braces were recognized as escape sequences and were removed from the regular expression, breaking it. The server thus received SQL such as:

```
-- Customer's zip code will be fixed
update address set zip_code = '99999'
where not regexp '^[0-9]([[.-.]])?([0-9])?$'
```

(Bug #41566)

- Using `useInformationSchema` with `DatabaseMetaData.getExportedKeys()` generated the following exception:

```
com.mysql.jdbc.exceptions.MySQLIntegrityConstraintViolationException: Column
'REFERENCED_TABLE_NAME' in where clause is ambiguous
...
at com.mysql.jdbc.PreparedStatement.executeInternal(PreparedStatement.java:1772)

at
com.mysql.jdbc.DatabaseMetaDataUsingInfoSchema.executeMetadataQuery(
DatabaseMetaDataUsingInfoSchema.java:50)
at
com.mysql.jdbc.DatabaseMetaDataUsingInfoSchema.getExportedKeys(
DatabaseMetaDataUsingInfoSchema.java:603)
```

(Bug #43714)

- The `SQLError.createLinkFailureMessageBasedOnHeuristics()` method created a message text for communication link failures. When certain conditions were met, this message included both “last packet sent” and “last packet received” information, but when those conditions were not met, only “last packet sent” information was provided.

  Information about when the last packet was successfully received should be provided in all cases. (Bug #44587)

- When `DatabaseMetaData.getProcedureColumns()` was called, the value for `LENGTH` was always returned as 65535, regardless of the column type (fixed or variable) or the actual length of the column.

  However, if you obtained the `PRECISION` value, this was correct for both fixed and variable length columns. (Bug #41269)

- The `DEFERRABILITY` column in database metadata result sets was expected to be of type `SHORT`. However, Connector/J returned it as `INTEGER`.

  This affected the following methods: `getImportedKeys()`, `getExportedKeys()`, `getCrossReference()`. (Bug #44867)

- The result set returned by `getIndexInfo()` did not have the format defined in the JDBC API specifications. The fourth column, `DATA_TYPE`, of the result set should be of type `BOOLEAN`. Connector/J however returns `CHAR`. (Bug #44869)

- The result set returned by `getTypeInfo()` did not have the format defined in the JDBC API specifications. The second column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug #44868)

- The result set returned by `getColumns()` did not have the format defined in the JDBC API specifications. The fifth column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug #44865)

- The result set returned by `getVersionColumns()` did not have the format defined in the JDBC API specifications. The third column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug #44863)

- The result set returned by `getBestRowIdentifier()` did not have the format defined in the JDBC API specifications. The third column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug #44862)

- Connector/J contains logic to generate a message text specifically for streaming result sets when there are `CommunicationsException` exceptions generated. However, this code was never reached.

In the `CommunicationsException` code:

```
private boolean streamingResultSetInPlay = false;

public CommunicationsException(ConnectionImpl conn, long lastPacketSentTimeMs,
long lastPacketReceivedTimeMs, Exception underlyingException) {

this.exceptionMessage = SQLError.createLinkFailureMessageBasedOnHeuristics(conn,
      lastPacketSentTimeMs, lastPacketReceivedTimeMs, underlyingException,
      this.streamingResultSetInPlay);
```

`streamingResultSetInPlay` was always false, which in the following code in `SQLError.createLinkFailureMessageBasedOnHeuristics()` never being executed:

```
if (streamingResultSetInPlay) {
    exceptionMessageBuf.append(
    Messages.getString("CommunicationsException.ClientWasStreaming")); //$NON-NLS-1$
} else {
...
```

(Bug #44588)

- SQL injection was possible when using a string containing U+00A5 in a client-side prepared statement, and the character set being used was SJIS/Windows-31J. (Bug #41730)
- `Statement.getGeneratedKeys()` retained result set instances until the statement was closed. This caused memory leaks for long-lived statements, or statements used in tight loops. (Bug #44056)
- MySQL Connector/J 5.1.7 was slower than previous versions when the `rewriteBatchedStatements` option was set to `true`.

  > **Note**
  >
  > The performance regression in `indexOfIgnoreCaseRespectMarker()`has been fixed. It has also been made possible for the driver to rewrite `INSERT` statements with `ON DUPLICATE KEY UPDATE` clauses in them, as long as the `UPDATE` clause contains no reference to `LAST_INSERT_ID()`, as that would cause the driver to return bogus values for `getGeneratedKeys()` invocations. This has resulted in improved performance over version 5.1.7.

  (Bug #41532)

- `LoadBalancingConnectionProxy.doPing()` did not have blacklist awareness.

  `LoadBalancingConnectionProxy` implemented `doPing()` to ping all underlying connections, but it threw any exceptions it encountered during this process.

  With the global blacklist enabled, it catches these exceptions, adds the host to the global blacklist, and only throws an exception if all hosts are down. (Bug #43421)

- When connecting with `traceProtocol=true`, no trace data was generated for the server greeting or login request. (Bug #43070)
- When the MySQL Server was upgraded from 4.0 to 5.0, the Connector/J application then failed to connect to the server. This was because authentication failed when the application ran from EBCDIC platforms such as z/OS. (Bug #43071)
- A `ConcurrentModificationException` was generated in `LoadBalancingConnectionProxy`:

```
java.util.ConcurrentModificationException
 at java.util.HashMap$HashIterator.nextEntry(Unknown Source)
 at java.util.HashMap$KeyIterator.next(Unknown Source)
 at

 at
com.mysql.jdbc.LoadBalancingConnectionProxy.invoke(LoadBalancingConnectionProxy.java:390)
```

(Bug #42055)

- `PreparedStatement.addBatch()` did not check for all parameters being set, which led to inconsistent behavior in `executeBatch()`, especially when rewriting batched statements into multi-value `INSERT`s. (Bug #41161)

D.5.1.12. Changes in MySQL Connector/J 5.1.7 (21 October 2008)

Functionality Added or Changed

- When statements include `ON DUPLICATE UPDATE`, and `rewriteBatchedStatements` is set to true, batched statements are not rewritten into the form `INSERT INTO table VALUES (), (), ()`, instead the statements are executed sequentially.

Bugs Fixed

- `Statement.getGeneratedKeys()` returned two keys when using `ON DUPLICATE KEY UPDATE` and the row was updated, not inserted. (Bug #42309)
- When configuring the Java Replication Driver the last slave specified was never used. (Bug #39611)
- When using the replication driver with `autoReconnect=true`, Connector/J checks in `PreparedStatement.execute` (also called by `CallableStatement.execute`) to determine if the first character of the statement is an "S", in an attempt to block all statements that are not read-only-safe, for example non-`SELECT` statements. However, this also blocked `CALL`s to stored procedures, even if the stored procedures were defined as `SQL READ DATA` or `NO SQL`. (Bug #40031)
- When the `LoadBalancingConnectionProxy` handles a `SQLException` with SQL state starting with "08", it calls `invalidateCurrentConnection`, which in turn removes that `Connection` from `liveConnections` and the `connectionsToHostsMap`, but it did not add the host to the new global blacklist, if the global blacklist was enabled.

  There was also the possibility of a `NullPointerException` when trying to update stats, where `connectionsToHostsMap.get(this.currentConn)` was called:

  ```
  int hostIndex = ((Integer) this.hostsToListIndexMap.get(this.connectionsToHostsMap.get(this.currentConn))).intValue
  ```

  This could happen if a client tried to issue a rollback after catching a `SQLException` caused by a connection failure. (Bug #39784)
- When using the random load balancing strategy and starting with two servers that were both unavailable, an `IndexOutOfBoundsException` was generated when removing a server from the `whiteList`. (Bug #38782)
- With large result sets `ResultSet.findColumn` became a performance bottleneck. (Bug #39962)
- Connector/J ignored the value of the MySQL Server variable `auto_increment_increment`. (Bug #39956)
- When an `INSERT ON DUPLICATE KEY UPDATE` was performed, and the key already existed, the `affected-rows` value was returned as 1 instead of 0. (Bug #39352)
- Connector/J failed to parse `TIMESTAMP` strings for nanos correctly. (Bug #39911)
- Connector/J threw the following exception when using a read-only connection:

  ```
  java.sql.SQLException: Connection is read-only. Queries leading to data
  modification are not allowed.
  ```

  (Bug #38747)
- Connector/J was unable to connect when using a non-`latin1` password. (Bug #37570)
- The `useOldAliasMetadataBehavior` connection property was ignored. (Bug #35753)
- When `getGeneratedKeys()` was called on a statement that had not been created with `RETURN_GENERATED_KEYS`, no exception was thrown, and batched executions then returned erroneous values. (Bug #34185)
- The `loadBalance bestResponseTime` blacklists did not have a global state. (Bug #33861)
- Incorrect result is returned from `isAfterLast()` in streaming `ResultSet` when using `setFetchSize(Integer.MIN_VALUE)`. (Bug #35170)

D.5.1.13. Changes in MySQL Connector/J 5.1.6 (07 March 2008)

Functionality Added or Changed

- Multiple result sets were not supported when using streaming mode to return data. Both normal statements and the result sets

from stored procedures now return multiple results sets, with the exception of result sets using registered `OUTPUT` parameters. (Bug #33678)

- Add the `verifyServerCertificate` property. If set to "false" the driver will not verify the server's certificate when `useSSL` is set to "true"

  When using this feature, the keystore parameters should be specified by the `clientCertificateKeyStore*` properties, rather than system properties, as the JSSE doesn't it straightforward to have a nonverifying trust store and the "default" key store.

- The profiler event handling has been made extensible using the `profilerEventHandler` connection property.

- XAConnections and datasources have been updated to the JDBC-4.0 standard.

Bugs Fixed

- Prepared statements from pooled connections caused a `NullPointerException` when `closed()` under JDBC-4.0. (Bug #35489)

- When `useServerPrepStmts=true` and slow query logging is enabled, the connector throws a `NullPointerException` when it encounters a slow query. (Bug #35666)

- The JDBC driver uses a different method for evaluating column names in `resultsetmetadata.getColumnName()` and when looking for a column in `resultset.getObject(columnName)`. This causes Hibernate to fail in queries where the two methods yield different results, for example in queries that use alias names:

  ```
  SELECT column AS aliasName from table
  ```

  (Bug #35150)

- `DatabaseMetaData.getColumns()` returns incorrect `COLUMN_SIZE` value for `SET` column. (Bug #36830)

- When trying to read `Time` values like “00:00:00” with `ResultSet.getTime(int)` an exception is thrown. (Bug #36051)

- When using the keyword “loadbalance” in the connection string and trying to perform load balancing between two databases, the driver appears to hang. (Bug #35660)

- JDBC data type getter method was changed to accept only column name, whereas previously it accepted column label. (Bug #35610)

- In calling a stored function returning a `bigint`, an exception is encountered beginning:

  ```
  java.sql.SQLException: java.lang.NumberFormatException: For input string:
  ```

  followed by the text of the stored function starting after the argument list. (Bug #35199)

- JDBC connection URL parameters is ignored when using `MysqlConnectionPoolDataSource`. (Bug #35810)

- Retrieving the server version information for an active connection could return invalid information if the default character encoding on the host was not ASCII compatible. (Bug #31192)

- `MysqlConnectionPoolDataSource` does not support `ReplicationConnection`. Notice that we implemented `com.mysql.jdbc.Connection` for `ReplicationConnection`, however, only accessors from ConnectionProperties are implemented (not the mutators), and they return values from the currently active connection. All other methods from `com.mysql.jdbc.Connection` are implemented, and operate on the currently active connection, with the exception of `resetServerState()` and `changeUser()`. (Bug #34937)

- When calling `isValid()` on an active connection, if the timeout is nonzero then the `Connection` is invalidated even if the `Connection` is valid. (Bug #34703)

- When retrieving the column type name of a geometry field, the driver would return `UNKNOWN` instead of `GEOMETRY`. (Bug #34194)

- The internal class `ResultSetInternalMethods` referenced the nonpublic class `com.mysql.jdbc.CachedResultSetMetaData`. (Bug #33823)

- `ResultSet.getTimestamp()` would throw a `NullPointerException` instead of a `SQLException` when called on an empty `ResultSet`. (Bug #33162)

- `ResultSet.getTimestamp()` returns incorrect values for month/day of `TIMESTAMP`s when using server-side prepared statements (not enabled by default). (Bug #34913)
- `RowDataStatic` doesn't always set the metadata in `ResultSetRow`, which can lead to failures when unpacking `DATE`, `TIME`, `DATETIME` and `TIMESTAMP` types when using absolute, relative, and previous result set navigation methods. (Bug #34762)
- It was not possible to truncate a `BLOB` using `Blog.truncate()` when using 0 as an argument. (Bug #34677)
- Statements with batched values do not return correct values for `getGeneratedKeys()` when `rewriteBatchedStatements` is set to `true`, and the statement has an `ON DUPLICATE KEY UPDATE` clause. (Bug #34093)
- A `NullPointerException` could be raised when using client-side prepared statements and enabled the prepared statement cache using the `cachePrepStmts`. (Bug #33734)
- When using a cursor fetch for a statement, the internal prepared statement could cause a memory leak until the connection was closed. The internal prepared statement is now deleted when the corresponding result set is closed. (Bug #34518)
- Using server side cursors and cursor fetch, the table metadata information would return the data type name instead of the column name. (Bug #33594)
- `ResultSet` returned by `Statement.getGeneratedKeys()` is not closed automatically when statement that created it is closed. (Bug #30508)
- Load balancing connection using best response time would incorrectly "stick" to hosts that were down when the connection was first created.

  We solve this problem with a black list that is used during the picking of new hosts. If the black list ends up including all configured hosts, the driver will retry for a configurable number of times (the `retriesAllDown` configuration property, with a default of 120 times), sleeping 250ms between attempts to pick a new connection.

  We've also went ahead and made the balancing strategy extensible. To create a new strategy, implement the interface `com.mysql.jdbc.BalanceStrategy` (which also includes our standard "extension" interface), and tell the driver to use it by passing in the class name using the `loadBalanceStrategy` configuration property. (Bug #32877)
- Using `CallableStatement.setNull()` on a stored function would throw an `ArrayIndexOutOfBounds` exception when setting the last parameter to null. (Bug #31823)
- When using a connection from `ConnectionPoolDataSource`, some `Connection.prepareStatement()` methods would return null instead of the prepared statement. (Bug #32101)
- `MysqlValidConnectionChecker` doesn't properly handle connections created using `ReplicationConnection`. (Bug #31790)
- During a Daylight Savings Time (DST) switchover, there was no way to store two timestamp/datetime values , as the hours end up being the same when sent as the literal that MySQL requires.

  Note that to get this scenario to work with MySQL (since it doesn't support per-value timezones), you need to configure your server (or session) to be in UTC, and tell the driver not to use the legacy date/time code by setting `useLegacyDatetimeCode` to "false". This will cause the driver to always convert to/from the server and client timezone consistently.

  This bug fix also fixes Bug #15604, by adding entirely new date/time handling code that can be switched on by `useLegacyDatetimeCode` being set to "false" as a JDBC configuration property. For Connector/J 5.1.x, the default is "true", in trunk and beyond it will be "false" (that is, the old date/time handling code will be deprecated) (Bug #32577, Bug #15604)
- When unpacking rows directly, we don't hand off error message packets to the internal method which decodes them correctly, so no exception is raised, and the driver than hangs trying to read rows that aren't there. This tends to happen when calling stored procedures, as normal SELECTs won't have an error in this spot in the protocol unless an I/O error occurs. (Bug #32246)
- Further fixes have been made to this bug in the event that a node is nonresponsive. Connector/J will now try a different random node instead of waiting for the node to recover before continuing. (Bug #31053)
- `DatabaseMetadata.getColumns()` doesn't return the correct column names if the connection character isn't UTF-8. A bug in MySQL server compounded the issue, but was fixed within the MySQL 5.0 release cycle. The fix includes changes to all the sections of the code that access the server metadata. (Bug #20491)
- Fixed `ResultSetMetadata.getColumnName()` for result sets returned from `Statement.getGeneratedKeys()` - it was returning null instead of "GENERATED_KEY" as in 5.0.x.

D.5.1.14. Changes in MySQL Connector/J 5.1.5 (09 October 2007)

New Features, Compared to the 5.0 Series of Connector/J

- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.
- Support for JDBC-4.0 XML processing using JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query using `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information using a public interface).
- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.

Functionality Added or Changed

- Added `autoSlowLog` configuration property, overrides `slowQueryThreshold*` properties, driver determines slow queries by those that are slower than 5 * stddev of the mean query time (outside the 96% percentile).

Bugs Fixed

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. (Bug #28256)
- When calling `setTimestamp` on a prepared statement, the timezone information stored in the calendar object was ignored. This resulted in the incorrect `DATETIME` information being stored. The following example illustrates this:

```
Timestamp t = new Timestamp( cal.getTimeInMillis() );
ps.setTimestamp( N, t, cal );
```

  (Bug #15604)

D.5.1.15. Changes in MySQL Connector/J 5.1.4 (Not Released)

Only released internally.

Version 5.1.4 has no changelog entries.

D.5.1.16. Changes in MySQL Connector/J 5.1.3 (10 September 2007)

New Features, Compared to the 5.0 Series of Connector/J

- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.
- Support for JDBC-4.0 XML processing using JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query using `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information using a public interface).
- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.

Functionality Added or Changed

- Connector/J now connects using an initial character set of `utf-8` solely for the purpose of authentication to permit user names or database names in any character set to be used in the JDBC connection URL. (Bug #29853)
- Setting `useBlobToStoreUTF8OutsideBMP` to `true` tells the driver to treat `[MEDIUM/LONG]BLOB` columns as `[LONG]VARCHAR` columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server can't handle natively.

  Set `utf8OutsideBmpExcludedColumnNamePattern` to a regex so that column names matching the given regex will still be treated as `BLOBs` The regex must follow the patterns used for the `java.util.regex`package. The default is to exclude no columns, and include all columns.

Set `utf8OutsideBmpIncludedColumnNamePattern` to specify exclusion rules to utf8OutsideBmpExcludedColumnNamePattern". The regex must follow the patterns used for the `java.util.regex` package.

- New methods on com.mysql.jdbc.Statement: `setLocalInfileInputStream()` and `getLocalInfileInputStream()`:
  - `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

    This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

    If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.
  - `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.

    This method returns `NULL` if no such stream has been set using `setLocalInfileInputStream()`.
- Errors encountered during `Statement`/`PreparedStatement`/`CallableStatement.executeBatch()` when `rewriteBatchStatements` has been set to `true` now return `BatchUpdateExceptions` according to the setting of `continueBatchOnError`.

  If `continueBatchOnError` is set to `true`, the update counts for the "chunk" that were sent as one unit will all be set to `EXECUTE_FAILED`, but the driver will attempt to process the remainder of the batch. You can determine which "chunk" failed by looking at the update counts returned in the `BatchUpdateException`.

  If `continueBatchOnError` is set to "false", the update counts returned will contain all updates up-to and including the failed "chunk", with all counts for the failed "chunk" set to `EXECUTE_FAILED`.

  Since MySQL doesn't return multiple error codes for multiple-statements, or for multi-value `INSERT`/`REPLACE`, it is the application's responsibility to handle determining which item(s) in the "chunk" actually failed.
- `Statement.setQueryTimeout()`s now affect the entire batch for batched statements, rather than the individual statements that make up the batch.
- JDBC-4.0 ease-of-development features including auto-registration with the `DriverManager` through the service provider mechanism, standardized Connection validity checks and categorized `SQLExceptions` based on recoverability/retry-ability and class of the underlying error.
- The driver will automatically adjust the server session variable `net_write_timeout` when it determines its been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (The configuration property is named `netTimeoutForStreamingResults`, with a unit of seconds, the value '0' means the driver will not try and adjust this value).
- Added experimental support for statement "interceptors" through the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`. Implement this interface to be placed "in between" query execution, so that it can be influenced (currently experimental).
- The data (and how it is stored) for `ResultSet` rows are now behind an interface which enables us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- The driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.
- Setting `rewriteBatchedStatements` to `true` now causes CallableStatements with batched arguments to be re-written in the form "CALL (...); CALL (...); ..." to send the batch in as few client/server round trips as possible.
- Added two configuration parameters:
  - `blobsAreStrings`: Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
  - `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBs` as Strings. Ad-

ded specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.

Bugs Fixed

- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

  The fix involves changing the behavior of `noAccessToProcedureBodies`,in that the driver will now report all parameters as `IN` parameters but permit callers to call registerOutParameter() on them without throwing an exception. (Bug #28689)

- NPE with null column values when `padCharsWithSpace` is set to true. (Bug #30851)

- `setObject(int, Object, int, int)` delegate in PreparedStatementWrapper delegates to wrong method. (Bug #30892)

- Closing a load-balanced connection would cause a `ClassCastException`. (Bug #29852)

- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3 to 5.0.5 and 65 for versions newer than 5.0.5. (Bug #28972)

- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug #30550)

- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. (Bug #30664)

- Connection checker for JBoss didn't use same method parameters using reflection, causing connections to always seem "bad". (Bug #29106)

- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug #27867)

- `Connection.getServerCharacterEncoding()` doesn't work for servers with version >= 4.1. (Bug #27182)

- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug #27915)

- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug #21116)

- Specifying a "validation query" in your connection pool that starts with "/* ping */" _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a ReplicationConnection or a LoadBalancedConnection, will send the ping across all active connections.

D.5.1.17. Changes in MySQL Connector/J 5.1.2 (29 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Functionality Added or Changed

- Setting the configuration property `rewriteBatchedStatements` to `true` will now cause the driver to rewrite batched prepared statements with more than 3 parameter sets in a batch into multi-statements (separated by ";") if they are not plain (that is, without `SELECT` or `ON DUPLICATE KEY UPDATE` clauses) `INSERT` or `REPLACE` statements.

D.5.1.18. Changes in MySQL Connector/J 5.1.1 (22 June 2007)

This is a new Alpha development release, adding new features and fixing recently discovered bugs.

Functionality Added or Changed

- **Incompatible Change**: Pulled vendor-extension methods of `Connection` implementation out into an interface to support `java.sql.Wrapper` functionality from `ConnectionPoolDataSource`. The vendor extensions are javadoc'd in the `com.mysql.jdbc.Connection` interface.

For those looking further into the driver implementation, it is not an API that is used for pluggability of implementations inside our driver (which is why there are still references to `ConnectionImpl` throughout the code).

We've also added server and client `prepareStatement()` methods that cover all of the variants in the JDBC API.

`Connection.serverPrepare(String)` has been re-named to `Connection.serverPrepareStatement()` for consistency with `Connection.clientPrepareStatement()`.

- Setting `rewriteBatchedStatements` to `true` now causes `CallableStatements` with batched arguments to be re-written in the form `CALL (...); CALL (...); ...` to send the batch in as few client/server round trips as possible.
- See the sources (fully javadoc'd) for `com.mysql.jdbc.StatementInterceptor` for more details until we iron out the API and get it documented in the manual.
- Added experimental support for statement "interceptors" through the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`.

  Implement this interface to be placed "in between" query execution, so that you can influence it. (currently experimental).

  `StatementInterceptors` are "chainable" when configured by the user, the results returned by the "current" interceptor will be passed on to the next on in the chain, from left-to-right order, as specified by the user in the JDBC configuration property `statementInterceptors`.
- Driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.
- Similar to `Connection`, we pulled out vendor extensions to `Statement` into an interface named `com.mysql.Statement`, and moved the `Statement` class into `com.mysql.StatementImpl`. The two methods (javadoc'd in `com.mysql.Statement` are `enableStreamingResults()`, which already existed, and `disableStreamingResults()` which sets the statement instance back to the fetch size and result set type it had before `enableStreamingResults()` was called.
- The data (and how it is stored) for `ResultSet` rows are now behind an interface which enables us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Externalized the descriptions of connection properties.
- Made it possible to retrieve prepared statement parameter bindings (to be used in `StatementInterceptors`, primarily).
- Row navigation now causes any streams/readers open on the result set to be closed, as in some cases we're reading directly from a shared network packet and it will be overwritten by the "next" row.

D.5.1.19. Changes in MySQL Connector/J 5.1.0 (11 April 2007)

This is the first public alpha release of the current Connector/J 5.1 development branch, providing an insight to upcoming features. Although some of these are still under development, this release includes the following new features and changes (in comparison to the current Connector/J 5.0 production release):

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

> **Note**
>
> The disabling of server-side prepared statements does not affect the operation of the connector. However, if you use the `useTimezone=true` connection option and use client-side prepared statements (instead of server-side prepared statements) you should also set `useSSPSCompatibleTimezoneShift=true`.

Functionality Added or Changed

- Added support for JDBC-4.0's `Wrapper` interface.
- `com.mysql.jdbc.java6.rtjar`: Full path to your Java-6 `rt.jar` file
- Added support for JDBC-4.0's client information. The backend storage of information provided using `Connection.setClientInfo()` and retrieved by `Connection.getClientInfo()` is pluggable by any class that implements the `com.mysql.jdbc.JDBC4ClientInfoProvider` interface and has a no-args constructor.

  The implementation used by the driver is configured using the `clientInfoProvider` configuration property (with a default of value of `com.mysql.jdbc.JDBC4CommentClientInfoProvider`, an implementation which lists the client information as a comment prepended to every query sent to the server).

  This functionality is only available when using Java-6 or newer.
- New feature—driver will automatically adjust session variable `net_write_timeout` when it determines it has been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (configuration property is named `netTimeoutForStreamingResults` value and has a unit of seconds, the value `0` means the driver will not try and adjust this value).
- Re-worked Ant buildfile to build JDBC-4.0 classes separately, as well as support building under Eclipse (since Eclipse can't mix/match JDKs).

  To build, you must set `JAVA_HOME` to J2SDK-1.4.2 or Java-5, and set the following properties on your Ant command line:

  - `com.mysql.jdbc.java6.javac`: Full path to your Java-6 `javac` executable
  - `com.mysql.jdbc.java6.rtjar`: Full path to your Java-6 `rt.jar` file
- Added support for JDBC-4.0's SQLXML interfaces.
- `com.mysql.jdbc.java6.javac`: Full path to your Java-6 `javac` executable
- Added support for JDBC-4.0's `NCLOB`, and `NCHAR`/`NVARCHAR` types.
- Added support for JDBC-4.0 categorized `SQLExceptions`.
- Refactored `CommunicationsException` into a JDBC-3.0 version, and a JDBC-4.0 version (which extends `SQLRecoverableException`, now that it exists).

  > **Note**
  >
  > This change means that if you were catching `com.mysql.jdbc.CommunicationsException` in your applications instead of looking at the SQLState class of `08`, and are moving to Java 6 (or newer), you need to change your imports to that exception to be `com.mysql.jdbc.exceptions.jdbc4.CommunicationsException`, as the old class will not be instantiated for communications link-related errors under Java 6.

D.5.2. Changes in MySQL Connector/J 5.0.x

D.5.2.1. Changes in MySQL Connector/J 5.0.8 (09 October 2007)

Functionality Added or Changed

- Driver will now fall back to sane defaults for `max_allowed_packet` and `net_buffer_length` if the server reports them incorrectly (and will log this situation at `WARN` level, since it is actually an error condition).
- XAConnections now start in auto-commit mode (as per JDBC-4.0 specification clarification).
- `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Added two configuration parameters:
  - `blobsAreStrings`: Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
  - `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.

- `blobsAreStrings`: Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.

Bugs Fixed

- Connections established using URLs of the form `jdbc:mysql:loadbalance://` weren't doing failover if they tried to connect to a MySQL server that was down. The driver now attempts connections to the next "best" (depending on the load balance strategy in use) server, and continues to attempt connecting to the next "best" server every 250 milliseconds until one is found that is up and running or 5 minutes has passed.

  If the driver gives up, it will throw the last-received `SQLException`. (Bug #31053)

- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

  The fix involves changing the behavior of `noAccessToProcedureBodies`,in that the driver will now report all parameters as `IN` parameters but permit callers to call registerOutParameter() on them without throwing an exception. (Bug #28689)

- NPE with null column values when `padCharsWithSpace` is set to true. (Bug #30851)

- `setObject(int, Object, int, int)` delegate in PreparedStatementWrapper delegates to wrong method. (Bug #30892)

- Closing a load-balanced connection would cause a `ClassCastException`. (Bug #29852)

- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3 to 5.0.5 and 65 for versions newer than 5.0.5. (Bug #28972)

- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug #30550)

- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. (Bug #30664)

- Connection checker for JBoss didn't use same method parameters using reflection, causing connections to always seem "bad". (Bug #29106)

- Cached metadata with `PreparedStatement.execute()` throws `NullPointerException`. (Bug #27412)

- `UNSIGNED` types not reported using `DBMD.getTypeInfo()`, and capitalization of type names is not consistent between `DBMD.getColumns()`, `RSMD.getColumnTypeName()` and `DBMD.getTypeInfo()`.

  This fix also ensures that the precision of `UNSIGNED MEDIUMINT` and `UNSIGNED BIGINT` is reported correctly using `DBMD.getColumns()`. (Bug #27916)

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. (Bug #28256)

- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug #27867)

- `Connection.getServerCharacterEncoding()` doesn't work for servers with version >= 4.1. (Bug #27182)

- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug #27915)

- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug #21116)

- Specifying a "validation query" in your connection pool that starts with "/* ping */" _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a ReplicationConnection or a LoadBalancedConnection, will send the ping across all active connections.

D.5.2.2. Changes in MySQL Connector/J 5.0.7 (20 July 2007)

Functionality Added or Changed

- Added configuration property `useNanosForElapsedTime` - for profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (requires JDK >= 1.5)?

  > **Note**
  >
  > If `useNanosForElapsedTime` is set to `true`, and this property is set to "0" (or left default), then elapsed times will still be measured in nanoseconds (if possible), but the slow query threshold will be converted from milliseconds to nanoseconds, and thus have an upper bound of approximately 2000 milliseconds (as that threshold is represented as an integer, not a long).

- Added new debugging functionality - Setting configuration property `includeInnodbStatusInDeadlockExceptions` to `true` will cause the driver to append the output of `SHOW ENGINE INNODB STATUS` to deadlock-related exceptions, which will enumerate the current locks held inside InnoDB.
- `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for java.net.Socket.setTrafficClass() for more information.
- `tcpSndBuf` - Should the driver set SO_SND_BUF to the given value? The default value of '0', means use the platform default value for this property.
- Setting the configuration parameter `useCursorFetch` to `true` for MySQL-5.0+ enables the use of cursors that enable Connector/J to save memory by fetching result set rows in chunks (where the chunk size is set by calling setFetchSize() on a Statement or ResultSet) by using fully-materialized cursors on the server.
- Added configuration properties to enable tuning of TCP/IP socket parameters:
  - `tcpNoDelay` - Should the driver set SO_TCP_NODELAY (disabling the Nagle Algorithm, default `true`)?
  - `tcpKeepAlive` - Should the driver set SO_KEEPALIVE (default `true`)?
  - `tcpRcvBuf` - Should the driver set SO_RCV_BUF to the given value? The default value of '0', means use the platform default value for this property.
  - `tcpSndBuf` - Should the driver set SO_SND_BUF to the given value? The default value of '0', means use the platform default value for this property.
  - `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for java.net.Socket.setTrafficClass() for more information.
- Setting `useDynamicCharsetInfo` to `false` now causes driver to use static lookups for collations as well (makes ResultSetMetadata.isCaseSensitive() much more efficient, which leads to performance increase for ColdFusion, which calls this method for every column on every table it sees, it appears).
- `tcpRcvBuf` - Should the driver set SO_RCV_BUF to the given value? The default value of '0', means use the platform default value for this property.
- Added configuration property `slowQueryThresholdNanos` - if `useNanosForElapsedTime` is set to `true`, and this property is set to a nonzero value the driver will use this threshold (in nanosecond units) to determine if a query was slow, instead of using millisecond units.
- `tcpNoDelay` - Should the driver set SO_TCP_NODELAY (disabling the Nagle Algorithm, default `true`)?
- Driver detects when it is running in a ColdFusion MX server (tested with version 7), and uses the configuration bundle `coldFusion`, which sets `useDynamicCharsetInfo` to `false` (see previous entry), and sets `useLocalSessionState` and autoReconnect to `true`.
- Give more information in EOFExceptions thrown out of MysqlIO (how many bytes the driver expected to read, how many it actually read, say that communications with the server were unexpectedly lost).
- `tcpKeepAlive` - Should the driver set SO_KEEPALIVE (default `true`)?
- The driver will now automatically set `useServerPrepStmts` to `true` when `useCursorFetch` has been set to `true`, since the feature requires server-side prepared statements to function.

Bugs Fixed

- Parser in client-side prepared statements eats character following '/' if it is not a multi-line comment. (Bug #28851)
- Parser in client-side prepared statements runs to end of statement, rather than end-of-line for '#' comments. Also added support

for '--' single-line comments. (Bug #28956)

- Don't send any file data in response to LOAD DATA LOCAL INFILE if the feature is disabled at the client side. This is to prevent a malicious server or man-in-the-middle from asking the client for data that the client is not expecting. Thanks to Jan Kneschke for discovering the exploit and Andrey "Poohie" Hristov, Konstantin Osipov and Sergei Golubchik for discussions about implications and possible fixes. (Bug #29605)

- PreparedStatement.getMetaData() for statements containing leading one-line comments is not returned correctly.

  As part of this fix, we also overhauled detection of DML for `executeQuery()` and `SELECT`s for `executeUpdate()` in plain and prepared statements to be aware of the same types of comments. (Bug #28469)

D.5.2.3. Changes in MySQL Connector/J 5.0.6 (15 May 2007)

Functionality Added or Changed

- More intelligent initial packet sizes for the "shared" packets are used (512 bytes, rather than 16K), and initial packets used during handshake are now sized appropriately as to not require reallocation.

- Driver will now use `INSERT INTO ... VALUES (DEFAULT)` form of statement for updatable result sets for `ResultSet.insertRow()`, rather than pre-populating the insert row with values from `DatabaseMetaData.getColumns()` (which results in a `SHOW FULL COLUMNS` on the server for every result set). If an application requires access to the default values before `insertRow()` has been called, the JDBC URL should be configured with `populateInsertRowWithDefaultValues` set to `true`.

  This fix specifically targets performance issues with ColdFusion and the fact that it seems to ask for updatable result sets no matter what the application does with them.

- Fixed issue where a failed-over connection would let an application call `setReadOnly(false)`, when that call should be ignored until the connection is reconnected to a writable master unless `failoverReadOnly` had been set to `false`.

- `com.mysql.jdbc.[NonRegistering]Driver` now understands URLs of the format `jdbc:mysql:replication://` and `jdbc:mysql:loadbalance://` which will create a ReplicationConnection (exactly like when using `[NonRegistering]ReplicationDriver`) and an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment, respectively.

  In an effort to simplify things, we're working on deprecating multiple drivers, and instead specifying different core behavior based upon JDBC URL prefixes, so watch for `[NonRegistering]ReplicationDriver` to eventually disappear, to be replaced with `com.mysql.jdbc[NonRegistering]Driver` with the new URL prefix.

- `random`: The driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.

- Give better error message when "streaming" result sets, and the connection gets clobbered because of exceeding `net_write_timeout` on the server.

- New configuration property, `enableQueryTimeouts` (default `true`).

  When enabled, query timeouts set with `Statement.setQueryTimeout()` use a shared `java.util.Timer` instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the `TimerTask` for the given timeout which won't be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality. (this configuration property is part of the `maxPerformance` configuration bundle).

- Added configuration property `useDynamicCharsetInfo`. If set to `false` (the default), the driver will use a per-connection cache of character set information queried from the server when necessary, or when set to `true`, use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver.

  > **Note**
  >
  > This only affects the `padCharsWithSpace` configuration property and the `ResultSetMetaData.getColumnDisplayWidth()` method.

- When `useLocalSessionState` is set to `true` and connected to a MySQL-5.0 or later server, the JDBC driver will now determine whether an actual `commit` or `rollback` statement needs to be sent to the database when `Connection.commit()` or `Connection.rollback()` is called.

This is especially helpful for high-load situations with connection pools that always call `Connection.rollback()` on connection check-in/check-out because it avoids a round-trip to the server.

- Added configuration property `padCharsWithSpace` (defaults to `false`). If set to `true`, and a result set column has the `CHAR` type and the value does not fill the amount of characters specified in the DDL for the column, the driver will pad the remaining characters with space (for ANSI compliance).
- `bestResponseTime`: The driver will route the request to the host that had the best response time for the previous transaction.
- Added an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment (This is not for master-slave replication. For that, we suggest you look at `ReplicationConnection` or `lbpool`).

  If the JDBC URL starts with `jdbc:mysql:loadbalance://host-1,host-2,...host-n`, the driver will create an implementation of `java.sql.Connection` that load balances requests across a series of MySQL JDBC connections to the given hosts, where the balancing takes place after transaction commit.

  Therefore, for this to work (at all), you must use transactions, even if only reading data.

  Physical connections to the given hosts will not be created until needed.

  The driver will invalidate connections that it detects have had communication errors when processing a request. A new connection to the problematic host will be attempted the next time it is selected by the load balancing algorithm.

  There are two choices for load balancing algorithms, which may be specified by the `loadBalanceStrategy` JDBC URL configuration property:

  - `random`: The driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
  - `bestResponseTime`: The driver will route the request to the host that had the best response time for the previous transaction.

Bugs Fixed

- When the configuration property `useCursorFetch` was set to `true`, sometimes server would return new, more exact metadata during the execution of the server-side prepared statement that enables this functionality, which the driver ignored (using the original metadata returned during `prepare()`), causing corrupt reading of data due to type mismatch when the actual rows were returned. (Bug #26173)
- Whitespace surrounding storage/size specifiers in stored procedure parameters declaration causes `NumberFormatException` to be thrown when calling stored procedure on JDK-1.5 or newer, as the Number classes in JDK-1.5+ are whitespace intolerant. (Bug #25624)
- `Connection.getTransactionIsolation()` uses "`SHOW VARIABLES LIKE`" which is very inefficient on MySQL-5.0+ servers. (Bug #27655)
- `ResultSet.get*()` with a column index < 1 returns misleading error message. (Bug #27317)
- Fixed issue where calling `getGeneratedKeys()` on a prepared statement after calling `execute()` didn't always return the generated keys (`executeUpdate()` worked fine however). (Bug #27655)
- `BIT(> 1)` is returned as `java.lang.String` from `ResultSet.getObject()` rather than `byte[]`. (Bug #25328)
- `PreparedStatement` is not closed in `BlobFromLocator.getBytes()`. (Bug #26592)
- Fast date/time parsing doesn't take into account `00:00:00` as a legal value. (Bug #26789)
- Client options not sent correctly when using SSL, leading to stored procedures not being able to return results. Thanks to Don Cohen for the bug report, testcase and patch. (Bug #25545)
- More useful error messages are generated when the driver thinks a result set is not updatable. (Thanks to Ashley Martens for the patch). (Bug #28085)
- `CALL /* ... */ some_proc()` doesn't work. As a side effect of this fix, you can now use `/* */` and `#` comments when preparing statements using client-side prepared statement emulation.

If the comments happen to contain parameter markers (?), they will be treated as belonging to the comment (that is, not recognized) rather than being a parameter of the statement.

> **Note**
>
> The statement when sent to the server will contain the comments as-is, they're not stripped during the process of preparing the `PreparedStatement` or `CallableStatement`.

(Bug #27400)

- Comments in DDL of stored procedures/functions confuse procedure parser, and thus metadata about them can not be created, leading to inability to retrieve said metadata, or execute procedures that have certain comments in them. (Bug #26959)
- Using `ResultSet.get*()` with a column index less than 1 returns a misleading error message. (Bug #27317)
- `CallableStatements` with `OUT/INOUT` parameters that are "binary" (`BLOB`, `BIT`, `(VAR)BINARY`, `JAVA_OBJECT`) have extra 7 bytes. (Bug #25715)
- `Statement.setMaxRows()` is not effective on result sets materialized from cursors. (Bug #25517)

D.5.2.4. Changes in MySQL Connector/J 5.0.5 (02 March 2007)

Functionality Added or Changed

- We've added a new configuration option `treatUtilDateAsTimestamp`, which is `false` by default, as (1) We already had specific behavior to treat java.util.Date as a java.sql.Timestamp because it is useful to many folks, and (2) that behavior will very likely be required for drivers JDBC-post-4.0.
- Added configuration property `localSocketAddress`, which is the host name or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.
- Fixed logging of XA commands sent to server, it is now configurable using `logXaCommands` property (defaults to `false`).
- Usage Advisor now detects empty results sets and does not report on columns not referenced in those empty sets.
- Improved speed of `datetime` parsing for ResultSets that come from plain or nonserver-side prepared statements. You can enable old implementation with `useFastDateParsing=false` as a configuration parameter.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

  To enable server-side prepared statements you must add the following configuration property to your connector string:

  ```
  useServerPrepStmts=true
  ```

  The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).
- The `rewriteBatchedStatements` feature can now be used with server-side prepared statements.
- Usage Advisor will now issue warnings for result sets with large numbers of rows. You can configure the trigger value by using the `resultSetSizeThreshold` parameter, which has a default value of 100.

Bugs Fixed

- When using a server-side prepared statement the driver would send timestamps to the server using nanoseconds instead of milliseconds. (Bug #21438)
- Connection property `socketFactory` wasn't exposed using correctly named mutator/accessor, causing data source implementations that use JavaBean naming conventions to set properties to fail to set the property (and in the case of SJAS, fail silently when trying to set this parameter). (Bug #26326)
- `ParameterMetaData` throws `NullPointerException` when prepared SQL has a syntax error. Added `generateSimpleParameterMetadata` configuration property, which when set to `true` will generate metadata reflecting `VARCHAR` for every parameter (the default is `false`, which will cause an exception to be thrown if no parameter metadata for the statement is actually available). (Bug #21267)

- Connector/J now returns a better error message when server doesn't return enough information to determine stored procedure/function parameter types. (Bug #24065)
- When using the `rewriteBatchedStatements` connection option with `PreparedState.executeBatch()` an internal memory leak would occur. (Bug #25073)
- `EscapeProcessor` gets confused by multiple backslashes. We now push the responsibility of syntax errors back on to the server for most escape sequences. (Bug #25399)
- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. (Bug #24840)
- `DatabaseMetaData.getSchemas()` doesn't return a `TABLE_CATALOG` column. (Bug #23303)
- `INOUT` parameters in `CallableStatements` get doubly-escaped. (Bug #25379)
- Client-side prepared statement parser gets confused by in-line comments `/*...*/` and therefore cannot rewrite batch statements or reliably detect the type of statements when they are used. (Bug #25025)
- Results sets from `UPDATE` statements that are part of multi-statement queries would cause an `SQLException` error, "Result is from UPDATE". (Bug #25009)
- When using server-side prepared statements and timestamp columns, value would be incorrectly populated (with nanoseconds, not microseconds). (Bug #21438)
- Some exceptions thrown out of `StandardSocketFactory` were needlessly wrapped, obscuring their true cause, especially when using socket timeouts. (Bug #21480)
- `StringUtils.indexOfIgnoreCaseRespectQuotes()` isn't case-insensitive on the first character of the target. This bug also affected `rewriteBatchedStatements` functionality when prepared statements did not use uppercase for the `VALUES` clause. (Bug #25047)
- Using `DatabaseMetaData.getSQLKeywords()` does not return a all of the of the reserved keywords for the current MySQL version. Current implementation returns the list of reserved words for MySQL 5.1, and does not distinguish between versions. (Bug #24794)
- A query execution which timed out did not always throw a `MySQLTimeoutException`. (Bug #25836)
- A connection error would occur when connecting to a MySQL server with certain character sets. Some collations/character sets reported as "unknown" (specifically `cias` variants of existing character sets), and inability to override the detected server character set. (Bug #23645)
- Using `setFetchSize()` breaks prepared `SHOW` and other commands. (Bug #24360)
- Fixed issue where field-level for metadata from `DatabaseMetaData` when using `INFORMATION_SCHEMA` didn't have references to current connections, sometimes leading to Null Pointer Exceptions (NPEs) when introspecting them using `ResultSetMetaData`. (Bug #25073)
- Using `DATETIME` columns would result in time shifts when `useServerPrepStmts` was true. This occurred due to different behavior when using client-side compared to server-side prepared statements and the `useJDBCCompliantTimezoneShift` option. This is now fixed if moving from server-side prepared statements to client-side prepared statements by setting `useSSPSCompatibleTimezoneShift` to `true`, as the driver can't tell if this is a new deployment that never used server-side prepared statements, or if it is an existing deployment that is switching to client-side prepared statements from server-side prepared statements. (Bug #24344)
- When using a JDBC connection URL that is malformed, the `NonRegisteringDriver.getPropertyInfo` method will throw a Null Pointer Exception (NPE). (Bug #22628)
- Storing a `java.util.Date` object in a `BLOB` column would not be serialized correctly during `setObject`. (Bug #25787)
- Inconsistency between `getSchemas` and `INFORMATION_SCHEMA`. (Bug #23304)
- Calendars and timezones are now lazily instantiated when required. (Bug #24351)
- Timer instance used for `Statement.setQueryTimeout()` created per-connection, rather than per-VM, causing memory leak. (Bug #25514)
- Calling `Statement.cancel()` could result in a Null Pointer Exception (NPE). (Bug #24721)
- Fixed an issue where `XADataSources` couldn't be bound into JNDI, as the `DataSourceFactory` didn't know how to create instances of them.

Other Changes

- When using cached metadata, skip field-level metadata packets coming from the server, rather than reading them and discarding them without creating `com.mysql.jdbc.Field` instances.
- Use a `java.util.TreeMap` to map column names to ordinal indexes for `ResultSet.findColumn()` instead of a HashMap. This enables us to have case-insensitive lookups (required by the JDBC specification) without resorting to the many transient object instances needed to support this requirement with a normal `HashMap` with either case-adjusted keys, or case-insensitive keys. (In the worst case scenario for lookups of a 1000 column result set, TreeMaps are about half as fast wall-clock time as a HashMap, however in normal applications their use gives many orders of magnitude reduction in transient object instance creation which pays off later for CPU usage in garbage collection).
- Fixed cases where `ServerPreparedStatements` weren't using cached metadata when `cacheResultSetMetadata=true` was used.
- Take `localSocketAddress` property into account when creating instances of `CommunicationsException` when the underlying exception is a `java.net.BindException`, so that a friendlier error message is given with a little internal diagnostics.
- Fixed some Null Pointer Exceptions (NPEs) when cached metadata was used with `UpdatableResultSets`.
- When extracting foreign key information from `SHOW CREATE TABLE` in `DatabaseMetaData`, ignore exceptions relating to tables being missing (which could happen for cross-reference or imported-key requests, as the list of tables is generated first, then iterated).
- Reverted back to internal character conversion routines for single-byte character sets, as the ones internal to the JVM are using much more CPU time than our internal implementation.
- Changed cached result set metadata (when using `cacheResultSetMetadata=true`) to be cached per-connection rather than per-statement as previously implemented.
- Throw exceptions encountered during timeout to thread calling `Statement.execute*()`, rather than `RuntimeException`.
- Re-worked stored procedure parameter parser to be more robust. Driver no longer requires `BEGIN` in stored procedure definition, but does have requirement that if a stored function begins with a label directly after the "returns" clause, that the label is not a quoted identifier.
- Performance enhancement of initial character set configuration, driver will only send commands required to configure connection character set session variables if the current values on the server do not match what is required.
- Avoid static synchronized code in JVM class libraries for dealing with default timezones.

D.5.2.5. Changes in MySQL Connector/J 5.0.4 (20 October 2006)

Bugs Fixed

- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). (Bug #22290)
- Newlines causing whitespace to span confuse procedure parser when getting parameter metadata for stored procedures. (Bug #22024)
- Driver was using milliseconds for Statement.setQueryTimeout() when specification says argument is to be in seconds. (Bug #22359)
- Added new _ci collations to CharsetMapping - utf8_unicode_ci not working. (Bug #22456)
- Workaround for server crash when calling stored procedures using a server-side prepared statement (driver now detects prepare(stored procedure) and substitutes client-side prepared statement). (Bug #22297)
- When using information_schema for metadata, COLUMN_SIZE for getColumns() is not clamped to range of java.lang.Integer as is the case when not using information_schema, thus leading to a truncation exception that isn't present when not using information_schema. (Bug #21544)
- DBMD.getColumns() does not return expected COLUMN_SIZE for the SET type, now returns length of largest possible set disregarding whitespace or the "," delimiters to be consistent with the ODBC driver. (Bug #22613)

- Column names don't match metadata in cases where server doesn't return original column names (column functions) thus breaking compatibility with applications that expect 1-to-1 mappings between `findColumn()` and `rsmd.getColumnName()`, usually manifests itself as "Can't find column (")" exceptions. (Bug #21379)
- Driver now supports `{call sp}` (without "()" if procedure has no arguments).
- DatabaseMetaData correctly reports `true` for `supportsCatalog*()` methods.
- Fixed configuration property `jdbcCompliantTruncation` was not being used for reads of result set values.
- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'.

D.5.2.6. Changes in MySQL Connector/J 5.0.3 (26 July 2006, beta)

Functionality Added or Changed

- Added configuration option `noAccessToProcedureBodies` which will cause the driver to create basic parameter metadata for `CallableStatements` when the user does not have access to procedure bodies using `SHOW CREATE PROCEDURE` or selecting from `mysql.proc` instead of throwing an exception. The default value for this option is `false`

Bugs Fixed

- Fixed `Statement.cancel()` causes `NullPointerException` if underlying connection has been closed due to server failure. (Bug #20650)
- If the connection to the server has been closed due to a server failure, then the cleanup process will call `Statement.cancel()`, triggering a `NullPointerException`, even though there is no active connection. (Bug #20650)

D.5.2.7. Changes in MySQL Connector/J 5.0.2 (11 July 2006)

Bugs Fixed

- `MysqlXaConnection.recover(int flags)` now permits combinations of `XAResource.TMSTARTRSCAN` and `TMENDRSCAN`. To simulate the “scanning” nature of the interface, we return all prepared XIDs for `TMSTARTRSCAN`, and no new XIDs for calls with `TMNOFLAGS`, or `TMENDRSCAN` when not in combination with `TMSTARTRSCAN`. This change was made for API compliance, as well as integration with IBM WebSphere's transaction manager. (Bug #20242)
- Fixed `MysqlValidConnectionChecker` for JBoss doesn't work with `MySQLXADataSources`. (Bug #20242)
- Added connection/datasource property `pinGlobalTxToPhysicalConnection` (defaults to `false`). When set to `true`, when using `XAConnections`, the driver ensures that operations on a given XID are always routed to the same physical connection. This enables the `XAConnection` to support `XA START ... JOIN` after `XA END` has been called, and is also a workaround for transaction managers that don't maintain thread affinity for a global transaction (most either always maintain thread affinity, or have it as a configuration option). (Bug #20242)
- Fixed driver fails on non-ASCII platforms. The driver was assuming that the platform character set would be a superset of MySQL's `latin1` when doing the handshake for authentication, and when reading error messages. We now use Cp1252 for all strings sent to the server during the handshake phase, and a hard-coded mapping of the `language` system variable to the character set that is used for error messages. (Bug #18086)
- Fixed can't use `XAConnection` for local transactions when no global transaction is in progress. (Bug #17401)
- Better caching of character set converters (per-connection) to remove a bottleneck for multibyte character sets. (Bug #20242)
- Fixed `ConnectionProperties` (and thus some subclasses) are not serializable, even though some J2EE containers expect them to be. (Bug #19169)

D.5.2.8. Changes in MySQL Connector/J 5.0.1 (Not Released)

Not released due to a packaging error

Version 5.0.1 has no changelog entries.

D.5.2.9. Changes in MySQL Connector/J 5.0.0 (22 December 2005)

Bugs Fixed

- Added support for Connector/MXJ integration using url subprotocol `jdbc:mysql:mxj://...`. (Bug #14729)
- Idle timeouts cause `XAConnections` to whine about rolling themselves back. (Bug #14729)
- When fix for Bug #14562 was merged from 3.1.12, added functionality for `CallableStatement`'s parameter metadata to return correct information for `.getParameterClassName()`. (Bug #14729)
- Added service-provider entry to `META-INF/services/java.sql.Driver` for JDBC-4.0 support. (Bug #14729)
- Fuller synchronization of `Connection` to avoid deadlocks when using multithreaded frameworks that multithread a single connection (usually not recommended, but the JDBC spec permits it anyways), part of fix to Bug #14972). (Bug #14729)
- Moved all `SQLException` constructor usage to a factory in `SQLError` (ground-work for JDBC-4.0 `SQLState`-based exception classes). (Bug #14729)
- Removed Java5-specific calls to `BigDecimal` constructor (when result set value is `''`, `(int)0` was being used as an argument indirectly using method return value. This signature doesn't exist prior to Java5.) (Bug #14729)
- Implementation of `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL-5.0.0 or newer server, require a separate connection to issue the `KILL QUERY` statement, and in the case of `setQueryTimeout()` creates an additional thread to handle the timeout functionality.

  Note: Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeExceptions` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead. (Bug #14729)
- Return "[VAR]BINARY" for `RSMD.getColumnTypeName()` when that is actually the type, and it can be distinguished (MySQL-4.1 and newer). (Bug #14729)
- Add one level of indirection of internal representation of `CallableStatement` parameter metadata to avoid class not found issues on JDK-1.3 for `ParameterMetadata` interface (which doesn't exist prior to JDBC-3.0).
- `PreparedStatement.setString()` didn't work correctly when `sql_mode` on server contained `NO_BACKSLASH_ESCAPES` and no characters that needed escaping were present in the string.
- Setting `useJDBCCompliantTimezoneShift=true` (it is not the default) causes the driver to use GMT for *all* `TIMESTAMP/DATETIME` time zones, and the current VM time zone for any other type that refers to time zones. This feature can not be used when `useTimezone=true` to convert between server and client time zones.
- Return original column name for `RSMD.getColumnName()` if the column was aliased, alias name for `.getColumnLabel()` (if aliased), and original table name for `.getTableName()`. Note this only works for MySQL-4.1 and newer, as older servers don't make this information available to clients.
- Moved `-bin-g.jar` file into separate `debug` subdirectory to avoid confusion.
- `XADataSource` implemented (ported from 3.2 branch which won't be released as a product). Use `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` as your datasource class name in your application server to utilize XA transactions in MySQL-5.0.10 and newer.
- Do not permit `.setAutoCommit(true)`, or `.commit()` or `.rollback()` on an XA-managed connection as per the JDBC specification.
- If the connection `useTimezone` is set to `true`, then also respect time zone conversions in escape-processed string literals (for example, `"{ts ...}"` and `"{t ...}"`).
- Added unit tests for `XADatasource`, as well as friendlier exceptions for XA failures compared to the "stock" `XAException` (which has no messages).
- Attempt detection of the MySQL type `BINARY` (it is an alias, so this isn't always reliable), and use the `java.sql.Types.BINARY` type mapping for it.

D.5.3. Changes in MySQL Connector/J 3.1.x

D.5.3.1. Changes in MySQL Connector/J 3.1.15 (Not yet released)

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

Bugs Fixed

- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. (Bug #24840)

D.5.3.2. Changes in MySQL Connector/J 3.1.14 (19 October 2006)

Bugs Fixed

- Check and store value for continueBatchOnError property in constructor of Statements, rather than when executing batches, so that Connections closed out from underneath statements don't cause NullPointerExceptions when it is required to check this property. (Bug #22290)
- Fixed Updatable result set that contains a BIT column fails when server-side prepared statements are used. (Bug #20485)
- Escape of quotation marks in client-side prepared statements parsing not respected. Patch covers more than bug report, including NO_BACKSLASH_ESCAPES being set, and stacked quote characters forms of escaping (that is, " or ""). (Bug #20888)
- Driver now sends numeric 1 or 0 for client-prepared statement setBoolean() calls instead of '1' or '0'. (Bug #22290)
- Fixed bug where driver would not advance to next host if roundRobinLoadBalance=true and the last host in the list is down. (Bug #22290)
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). (Bug #22290)
- ResultSet.getSomeInteger() doesn't work for BIT(>1). (Bug #21062)
- Fixed bug when calling stored functions, where parameters weren't numbered correctly (first parameter is now the return value, subsequent parameters if specified start at index "2"). (Bug #22290)
- Removed logger autodetection altogether, must now specify logger explicitly if you want to use a logger other than one that logs to STDERR. (Bug #21207)
- Fixed can't pool server-side prepared statements, exception raised when re-using them. (Bug #20687)
- DDriver throws NPE when tracing prepared statements that have been closed (in asSQL()). (Bug #21207)
- Fixed ResultSet.getShort() for UNSIGNED TINYINT returns incorrect values when using server-side prepared statements. (Bug #20306)
- ReplicationDriver does not always round-robin load balance depending on URL used for slaves list. (Bug #19993)
- `DatabaseMetaData.getTables()` or `getColumns()` with a bad catalog parameter threw an exception rather than return an empty result set (as required by the specification). (Bug #18258)
- Fixed memory leak with profileSQL=true. (Bug #16987)
- Connection fails to localhost when using timeout and IPv6 is configured. (Bug #19726)
- Fixed updatable result set throws ClassCastException when there is row data and moveToInsertRow() is called. (Bug #20479)
- Fixed calling toString() on ResultSetMetaData for driver-generated (that is, from DatabaseMetaData method calls, or from getGeneratedKeys()) result sets would raise a NullPointerException. (Bug #19993)
- Fixed NullPointerException in MysqlDataSourceFactory due to Reference containing RefAddrs with null content. (Bug #16791)
- ResultSet.getFloatFromString() can't retrieve values near Float.MIN/MAX_VALUE. (Bug #18880)

D.5.3.3. Changes in MySQL Connector/J 3.1.13 (26 May 2006)

Bugs Fixed

- Added performance feature, re-writing of batched executes for `Statement.executeBatch()` (for all DML statements) and `PreparedStatement.executeBatch()` (for INSERTs with VALUE clauses only). Enable by using "rewriteBatchedStatements=true" in your JDBC URL. (Bug #18041)
- `DBMD.getColumns()` returns wrong type for `BIT`. (Bug #15854)
- `PreparedStatement.setObject()` serializes `BigInteger` as object, rather than sending as numeric value (and is thus not complementary to `.getObject()` on an `UNSIGNED LONG` type). (Bug #15383)
- Fixed aliased column names where length of name > 251 are corrupted. (Bug #18554)
- Exception thrown for new decimal type when using updatable result sets. (Bug #14609)
- Improved performance of retrieving `BigDecimal`, `Time`, `Timestamp` and `Date` values from server-side prepared statements by creating fewer short-lived instances of `Strings` when the native type is not an exact match for the requested type. (Bug #18496)
- Fixed calling `clearParameters()` on a closed prepared statement causes NPE. (Bug #17587)
- Driver now aware of fix for `BIT` type metadata that went into MySQL-5.0.21 for server not reporting length consistently . (Bug #13601)
- No "dos" character set in MySQL > 4.1.0. (Bug #15544)
- Map "latin1" on MySQL server to CP1252 for MySQL > 4.1.0. (Bug #17587)
- Fixed `CallableStatement.registerOutParameter()` not working when some parameters pre-populated. Still waiting for feedback from JDBC experts group to determine what correct parameter count from `getMetaData()` should be, however. (Bug #17898)
- Fixed `ResultSet.wasNull()` not always reset correctly for booleans when done using conversion for server-side prepared statements. (Bug #17450)
- Added support for Apache Commons logging, use "com.mysql.jdbc.log.CommonsLogger" as the value for the "logger" configuration property. (Bug #13469)
- Fixed `ResultSet.wasNull()` returns incorrect value when extracting native string from server-side prepared statement generated result set. (Bug #19282)
- Fixed updatable result set doesn't return `AUTO_INCREMENT` values for `insertRow()` when multiple column primary keys are used. (the driver was checking for the existence of single-column primary keys and an autoincrement value > 0 instead of a straightforward `isAutoIncrement()` check). (Bug #16841)
- Fixed invalid classname returned for `ResultSetMetaData.getColumnClassName()` for `BIGINT type`. (Bug #19282)
- `INOUT` parameter does not store `IN` value. (Bug #15464)
- Fixed issue with `ReplicationConnection` incorrectly copying state, doesn't transfer connection context correctly when transitioning between the same read-only states. (Bug #15570)
- Fixed case where driver wasn't reading server status correctly when fetching server-side prepared statement rows, which in some cases could cause warning counts to be off, or multiple result sets to not be read off the wire. (Bug #19282)
- `Fixed PreparedStatement.setObject(int, Object, int)` doesn't respect scale of BigDecimals. (Bug #19615)
- Fixed driver trying to call methods that don't exist on older and newer versions of Log4j. The fix is not trying to auto-detect presence of log4j, too many different incompatible versions out there in the wild to do this reliably.

  If you relied on autodetection before, you will need to add "logger=com.mysql.jdbc.log.Log4JLogger" to your JDBC URL to enable Log4J usage, or alternatively use the new "CommonsLogger" class to take care of this. (Bug #13469)
- Fixed `Statement.getGeneratedKeys()` throws `NullPointerException` when no query has been processed. (Bug #17099)

- `lib-nodist` directory missing from package breaks out-of-box build. (Bug #15676)
- Added additional accessor and mutator methods on ConnectionProperties so that DataSource users can use same naming as regular URL properties. (Bug #17587)
- LogFactory now prepends `com.mysql.jdbc.log` to the log class name if it cannot be found as specified. This enables you to use "short names" for the built-in log factories, for example, `logger=CommonsLogger` instead of `logger=com.mysql.jdbc.log.CommonsLogger`. (Bug #13469)
- Fixed data truncation and `getWarnings()` only returns last warning in set. (Bug #18740)
- Fixed issue where server-side prepared statements don't cause truncation exceptions to be thrown when truncation happens. (Bug #18041)
- Fixed issue where driver was unable to initialize character set mapping tables. Removed reliance on `.properties` files to hold this information, as it turns out to be too problematic to code around class loader hierarchies that change depending on how an application is deployed. Moved information back into the `CharsetMapping` class. (Bug #14938)
- `ResultSet.getShort()` for `UNSIGNED TINYINT` returned wrong values. (Bug #11874)

D.5.3.4. Changes in MySQL Connector/J 3.1.12 (30 November 2005)

Bugs Fixed

- Driver incorrectly closes streams passed as arguments to `PreparedStatements`. Reverts to legacy behavior by setting the JDBC configuration property `autoClosePStmtStreams` to `true` (also included in the 3-0-Compat configuration "bundle"). (Bug #15024)
- `storesMixedCaseIdentifiers()` returns `false` (Bug #14562)
- `storesLowerCaseIdentifiers()` returns `true` (Bug #14562)
- Deadlock while closing server-side prepared statements from multiple threads sharing one connection. (Bug #14972)
- OpenOffice expects `DBMD.supportsIntegrityEnhancementFacility()` to return `true` if foreign keys are supported by the datasource, even though this method also covers support for check constraints, which MySQL *doesn't* have. Setting the configuration property `overrideSupportsIntegrityEnhancementFacility` to `true` causes the driver to return `true` for this method. (Bug #12975)
- `storesMixedCaseQuotedIdentifiers()` returns `false` (Bug #14562)
- `storesMixedCaseQuotedIdentifiers()` returns `true` (Bug #14562)
- `maxQuerySizeToLog` is not respected. Added logging of bound values for `execute()` phase of server-side prepared statements when `profileSQL=true` as well. (Bug #13048)
- Process escape tokens in `Connection.prepareStatement(...)`. You can disable this behavior by setting the JDBC URL configuration property `processEscapeCodesForPrepStmts` to `false`. (Bug #15141)
- `DatabaseMetaData.getColumns()` doesn't return `TABLE_NAME` correctly. (Bug #14815)
- If `lower_case_table_names=0` (on server):
  - `storesLowerCaseIdentifiers()` returns `false`
  - `storesLowerCaseQuotedIdentifiers()` returns `false`
  - `storesMixedCaseIdentifiers()` returns `true`
  - `storesMixedCaseQuotedIdentifiers()` returns `true`
  - `storesUpperCaseIdentifiers()` returns `false`
  - `storesUpperCaseQuotedIdentifiers()` returns `true`

  (Bug #14562)
- `storesUpperCaseIdentifiers()` returns `false` (Bug #14562)

- `storesUpperCaseQuotedIdentifiers()` returns `true` (Bug #14562)
- If `lower_case_table_names=1` (on server):
  - `storesLowerCaseIdentifiers()` returns `true`
  - `storesLowerCaseQuotedIdentifiers()` returns `true`
  - `storesMixedCaseIdentifiers()` returns `false`
  - `storesMixedCaseQuotedIdentifiers()` returns `false`
  - `storesUpperCaseIdentifiers()` returns `false`
  - `storesUpperCaseQuotedIdentifiers()` returns `true`

  (Bug #14562)
- Extraneous sleep on `autoReconnect`. (Bug #13775)
- `storesLowerCaseQuotedIdentifiers()` returns `true` (Bug #14562)
- Fixed `DatabaseMetaData.stores*Identifiers()`:
  - If `lower_case_table_names=0` (on server):
    - `storesLowerCaseIdentifiers()` returns `false`
    - `storesLowerCaseQuotedIdentifiers()` returns `false`
    - `storesMixedCaseIdentifiers()` returns `true`
    - `storesMixedCaseQuotedIdentifiers()` returns `true`
    - `storesUpperCaseIdentifiers()` returns `false`
    - `storesUpperCaseQuotedIdentifiers()` returns `true`
  - If `lower_case_table_names=1` (on server):
    - `storesLowerCaseIdentifiers()` returns `true`
    - `storesLowerCaseQuotedIdentifiers()` returns `true`
    - `storesMixedCaseIdentifiers()` returns `false`
    - `storesMixedCaseQuotedIdentifiers()` returns `false`
    - `storesUpperCaseIdentifiers()` returns `false`
    - `storesUpperCaseQuotedIdentifiers()` returns `true`

  (Bug #14562)
- Reconnect during middle of `executeBatch()` should not occur if `autoReconnect` is enabled. (Bug #13255)
- `storesMixedCaseIdentifiers()` returns `true` (Bug #14562)
- Usage advisor complains about unreferenced columns, even though they've been referenced. (Bug #15065)
- `storesLowerCaseQuotedIdentifiers()` returns `false` (Bug #14562)
- Java type conversion may be incorrect for `MEDIUMINT`. (Bug #14562)
- Added `com.mysql.jdbc.testsuite.url.default` system property to set default JDBC url for testsuite (to speed up bug resolution when I'm working in Eclipse). (Bug #12975)
- Unable to initialize character set mapping tables (due to J2EE classloader differences). (Bug #14938)
- `storesLowerCaseIdentifiers()` returns `false` (Bug #14562)
- Escape processor replaces quote character in quoted string with string delimiter. (Bug #14909)

- Added configuration property `useGmtMillisForDatetimes` which when set to `true` causes `ResultSet.getDate()`, `.getTimestamp()` to return correct millis-since GMT when `.getTime()` is called on the return value (currently default is `false` for legacy behavior). (Bug #14562)
- `logSlowQueries` should give better info. (Bug #12230)
- Don't increase timeout for failover/reconnect. (Bug #6577)
- Fall back to platform-encoding for `URLDecoder.decode()` when parsing driver URL properties if the platform doesn't have a two-argument version of this method.
- Do not permit `executeBatch()` for `CallableStatements` with registered `OUT`/`INOUT` parameters (JDBC compliance).
- Fixed client-side prepared statement bug with embedded `?` characters inside quoted identifiers (it was recognized as a placeholder, when it was not).

D.5.3.5. Changes in MySQL Connector/J 3.1.11 (07 October 2005)

Bugs Fixed

- `getExportedKeys()` (Bug #12541)
- Specifying a catalog works as stated in the API docs. (Bug #12541)
- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties. (Bug #12541)
- Tokenizer for `=` in URL properties was causing `sessionVariables=....` to be parameterized incorrectly. (Bug #12753)
- `getIndexInfo()` (Bug #12541)
- `getProcedures()` (and thus indirectly `getProcedureColumns()`) (Bug #12541)
- `getImportedKeys()` (Bug #12541)
- Specifying `""` means “current” catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users. (Bug #12541)
- `getCrossReference()` (Bug #12541)
- The configuration property `sessionVariables` now permits you to specify variables that start with the “`@`” sign. (Bug #13453)
- Added `Connection.isMasterConnection()` for clients to be able to determine if a multi-host master/slave connection is connected to the first host in the list. (Bug #12541)
- Workaround for Bug #13374: `ResultSet.getStatement()` on closed result set returns `NULL` (as per JDBC 4.0 spec, but not backward-compatible). Set the connection property `retainStatementAfterResultSetClose` to `true` to be able to retrieve a `ResultSet`'s statement after the `ResultSet` has been closed using `.getStatement()` (the default is `false`, to be JDBC-compliant and to reduce the chance that code using JDBC leaks `Statement` instances). (Bug #13277)
- `java.sql.Types.OTHER` returned for `BINARY` and `VARBINARY` columns when using `DatabaseMetaData.getColumns()`. (Bug #12970)
- URL configuration parameters do not permit “`&`” or “`=`” in their values. The JDBC driver now parses configuration parameters as if they are encoded using the application/x-www-form-urlencoded format as specified by `java.net.URLDecoder` (http://java.sun.com/j2se/1.5.0/docs/api/java/net/URLDecoder.html).

  If the “`%`” character is present in a configuration property, it must now be represented as `%25`, which is the encoded form of “`%`” when using application/x-www-form-urlencoded encoding. (Bug #13453)
- `getColumns()` (Bug #12541)
- Handling of catalog argument in `DatabaseMetaData.getIndexInfo()`, which also means changes to the following methods in `DatabaseMetaData`:
  - `getBestRowIdentifier()`

  - `getColumns()`
  - `getCrossReference()`
  - `getExportedKeys()`
  - `getImportedKeys()`
  - `getIndexInfo()`
  - `getPrimaryKeys()`
  - `getProcedures()` (and thus indirectly `getProcedureColumns()`)
  - `getTables()`

  The `catalog` argument in all of these methods now behaves in the following way:

  - Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties.
  - Specifying `""` means "current" catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users.
  - Specifying a catalog works as stated in the API docs.
  - Made `Connection.clientPrepare()` available from "wrapped" connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances).

  (Bug #12541)

- `getBestRowIdentifier()` (Bug #12541)
- Made `Connection.clientPrepare()` available from "wrapped" connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances). (Bug #12541)
- `ServerPreparedStatement.getBinding()` now checks if the statement is closed before attempting to reference the list of parameter bindings, to avoid throwing a `NullPointerException`. (Bug #12970)
- `ResultSetMetaData` from `Statement.getGeneratedKeys()` caused a `NullPointerException` to be thrown whenever a method that required a connection reference was called. (Bug #13277)
- `cp1251` incorrectly mapped to `win1251` for servers newer than 4.0.x. (Bug #12752)
- When `gatherPerfMetrics` is enabled for servers older than 4.1.0, a `NullPointerException` is thrown from the constructor of `ResultSet` if the query doesn't use any tables. (Bug #13043)
- Backport of `VAR[BINARY|CHAR] [BINARY]` types detection from 5.0 branch. (Bug #13277)
- `getTables()` (Bug #12541)
- Fixed `NullPointerException` when converting `catalog` parameter in many `DatabaseMetaDataMethods` to `byte[]`s (for the result set) when the parameter is `null`. (`null` is not technically permitted by the JDBC specification, but we have historically permitted it). (Bug #13277)
- Backport of `Field` class, `ResultSetMetaData.getColumnClassName()`, and `ResultSet.getObject(int)` changes from 5.0 branch to fix behavior surrounding `VARCHAR BINARY`/`VARBINARY` and related types. (Bug #13277)
- Read response in `MysqlIO.sendFileToServer()`, even if the local file can't be opened, otherwise next query issued will fail, because it is reading the response to the empty `LOAD DATA INFILE` packet sent to the server. (Bug #13277)
- `Connection.prepareCall()` is database name case-sensitive (on Windows systems). (Bug #12417)
- `getPrimaryKeys()` (Bug #12541)
- Geometry types not handled with server-side prepared statements. (Bug #12104)
- `explainSlowQueries` hangs with server-side prepared statements. (Bug #12229)
- `Pstmt.setObject(...., Types.BOOLEAN)` throws exception. (Bug #11798)
- Reworked `Field` class, `*Buffer`, and `MysqlIO` to be aware of field lengths > `Integer.MAX_VALUE`. (Bug #11498)

- Foreign key information that is quoted is parsed incorrectly when `DatabaseMetaData` methods use that information. (Bug #11781)
- Fixed regression caused by fix for Bug #11552 that caused driver to return incorrect values for unsigned integers when those integers where within the range of the positive signed type. (Bug #11663)
- Escape tokenizer doesn't respect stacked single quotation marks for escapes. (Bug #11797)
- Escape processor didn't honor strings demarcated with double quotation marks. (Bug #11498)
- `maxPerformance.properties` mis-spells “elideSetAutoCommits”. (Bug #11976)
- Moved source code to Subversion repository. (Bug #11663)
- The `sendBlobChunkSize` property is now clamped to `max_allowed_packet` with consideration of stream buffer size and packet headers to avoid `PacketTooBigExceptions` when `max_allowed_packet` is similar in size to the default `sendBlobChunkSize` which is 1M. (Bug #11781)
- `Statement.getWarnings()` fails with NPE if statement has been closed. (Bug #10630)
- `DBMD.storesLower/Mixed/UpperIdentifiers()` reports incorrect values for servers deployed on Windows. (Bug #11575)
- `ResultSet.moveToCurrentRow()` fails to work when preceded by a call to `ResultSet.moveToInsertRow()`. (Bug #11190)
- `VARBINARY` data corrupted when using server-side prepared statements and `.setBytes()`. (Bug #11115)
- Only get `char[]` from SQL in `PreparedStatement.ParseInfo()` when needed. (Bug #10630)
- Incorrect generation of testcase scripts for server-side prepared statements. (Bug #11663)
- `GEOMETRY` type not recognized when using server-side prepared statements. (Bug #11797)
- `CallableStatement.clearParameters()` now clears resources associated with `INOUT`/`OUTPUT` parameters as well as `INPUT` parameters. (Bug #11781)
- `StringUtils.getBytes()` doesn't work when using multi-byte character encodings and a length in *characters* is specified. (Bug #11614)
- Fixed statements generated for testcases missing `;` for “plain” statements. (Bug #11629)
- `ReplicationConnection` won't switch to slave, throws “Catalog can't be null” exception. (Bug #11879)
- Spurious `!` on console when character encoding is `utf8`. (Bug #11629)
- Properties shared between master and slave with replication connection. (Bug #12218)
- Updated `DBMD.supportsCorrelatedQueries()` to return `true` for versions > 4.1, `supportsGroupByUnrelated()` to return `true` and `getResultSetHoldability()` to return `HOLD_CURSORS_OVER_COMMIT`. (Bug #11498)
- Lifted restriction of changing streaming parameters with server-side prepared statements. As long as `all` streaming parameters were set before execution, `.clearParameters()` does not have to be called. (due to limitation of client/server protocol, prepared statements can not reset *individual* stream data on the server side). (Bug #11498)

D.5.3.6. Changes in MySQL Connector/J 3.1.10 (23 June 2005)

Bugs Fixed

- Fixed connecting without a database specified raised an exception in `MysqlIO.changeDatabaseTo()`.
- Initial implemention of `ParameterMetadata` for `PreparedStatement.getParameterMetadata()`. Only works fully for `CallableStatements`, as current server-side prepared statements return every parameter as a `VARCHAR` type.

D.5.3.7. Changes in MySQL Connector/J 3.1.9 (22 June 2005)

Bugs Fixed

- Fixed `PreparedStatement.setClob()` not accepting `null` as a parameter. (Bug #11360)
- Actually write manifest file to correct place so it ends up in the binary jar file. (Bug #10144)
- Try to handle `OutOfMemoryErrors` more gracefully. Although not much can be done, they will in most cases close the connection they happened on so that further operations don't run into a connection in some unknown state. When an OOM has happened, any further operations on the connection will fail with a “Connection closed” exception that will also list the OOM exception as the reason for the implicit connection close event. (Bug #10850)
- `autoReconnect` ping causes exception on connection startup. (Bug #11259)
- Reorganized directory layout. Sources now are in `src` folder. Don't pollute parent directory when building, now output goes to `./build`, distribution goes to `./dist`. (Bug #10496)
- `Connection.setCatalog()` is now aware of the `useLocalSessionState` configuration property, which when set to `true` will prevent the driver from sending `USE ...` to the server if the requested catalog is the same as the current catalog. (Bug #11115)
- Setting `cachePrepStmts=true` now causes the `Connection` to also cache the check the driver performs to determine if a prepared statement can be server-side or not, as well as caches server-side prepared statements for the lifetime of a connection. As before, the `prepStmtCacheSize` parameter controls the size of these caches. (Bug #10850)
- Don't send `COM_RESET_STMT` for each execution of a server-side prepared statement if it isn't required. (Bug #10850)
- `3-0-Compat`: Compatibility with Connector/J 3.0.x functionality (Bug #11115)
- Production package doesn't include JBoss integration classes. (Bug #11411)
- `maxPerformance`: Maximum performance without being reckless (Bug #11115)
- Unsigned `SMALLINT` treated as signed for `ResultSet.getInt()`, fixed all cases for `UNSIGNED` integer values and server-side prepared statements, as well as `ResultSet.getObject()` for `UNSIGNED TINYINT`. (Bug #10156)
- `solarisMaxPerformance`: Maximum performance for Solaris, avoids syscalls where it can (Bug #11115)
- Added `maintainTimeStats` configuration property (defaults to `true`), which tells the driver whether or not to keep track of the last query time and the last successful packet sent to the server's time. If set to `false`, removes two syscalls per query. (Bug #11115)
- 0-length streams not sent to server when using server-side prepared statements. (Bug #10850)
- The data type returned for `TINYINT(1)` columns when `tinyInt1isBit=true` (the default) can be switched between `Types.BOOLEAN` and `Types.BIT` using the new configuration property `transformedBitIsBoolean`, which defaults to `false`. If set to `false` (the default), `DatabaseMetaData.getColumns()` and `ResultSetMetaData.getColumnType()` will return `Types.BOOLEAN` for `TINYINT(1)` columns. If `true`, `Types.BOOLEAN` will be returned instead. Regardless of this configuration property, if `tinyInt1isBit` is enabled, columns with the type `TINYINT(1)` will be returned as `java.lang.Boolean` instances from `ResultSet.getObject(...)`, and `ResultSetMetaData.getColumnClassName()` will return `java.lang.Boolean`. (Bug #10485)
- `VARBINARY` data corrupted when using server-side prepared statements and `ResultSet.getBytes()`. (Bug #11115)
- Added `createDatabaseIfNotExist` property (default is `false`), which will cause the driver to ask the server to create the database specified in the URL if it doesn't exist. You must have the appropriate privileges for database creation for this to work. (Bug #10144)
- `SQLException` thrown when retrieving `YEAR(2)` with `ResultSet.getString()`. The driver will now always treat `YEAR` types as `java.sql.Dates` and return the correct values for `getString()`. Alternatively, the `yearIsDateType` connection property can be set to `false` and the values will be treated as `SHORT`s. (Bug #10485)
- Connector/J dumping query into `SQLException` twice. (Bug #11360)
- Made `ServerPreparedStatement.asSql()` work correctly so auto-explain functionality would work with server-side prepared statements. (Bug #10155)
- Double quotation marks not recognized when parsing client-side prepared statements. (Bug #10155)
- Removed nonsensical “costly type conversion” warnings when using usage advisor. (Bug #11411)
- `com.mysql.jdbc.PreparedStatement.ParseInfo` does unnecessary call to `toCharArray()`. (Bug #9064)
- Driver doesn't support `{?=CALL(...)}` for calling stored functions. This involved adding support for function retrieval to

`DatabaseMetaData.getProcedures()` and `getProcedureColumns()` as well. (Bug #10310)

- Memory leak in `ServerPreparedStatement` if `serverPrepare()` fails. (Bug #10144)
- Added support/bug hunting feature that generates `.sql` test scripts to `STDERR` when `autoGenerateTestcaseScript` is set to `true`. (Bug #10496)
- Driver detects if you're running MySQL-5.0.7 or later, and does not scan for `LIMIT ?[,?]` in statements being prepared, as the server supports those types of queries now. (Bug #10850)
- `SQLException` is thrown when using property `characterSetResults` with `cp932` or `eucjpms`. (Bug #10496)
- Made JDBC2-compliant wrappers public to enable access to vendor extensions. (Bug #10155)
- Added the following configuration bundles, use one or many using the `useConfigs` configuration property:
  - `maxPerformance`: Maximum performance without being reckless
  - `solarisMaxPerformance`: Maximum performance for Solaris, avoids syscalls where it can
  - `3-0-Compat`: Compatibility with Connector/J 3.0.x functionality

  (Bug #11115)
- `DatabaseMetaData.supportsMultipleOpenResults()` now returns `true`. The driver has supported this for some time, DBMD just missed that fact. (Bug #10155)
- Cleaned up logging of profiler events, moved code to dump a profiler event as a string to `com.mysql.jdbc.log.LogUtils` so that third parties can use it. (Bug #10155)
- Made `enableStreamingResults()` visible on `com.mysql.jdbc.jdbc2.optional.StatementWrapper`. (Bug #10155)
- Overhaul of character set configuration, everything now lives in a properties file.
- Driver now correctly uses CP932 if available on the server for Windows-31J, CP932 and MS932 java encoding names, otherwise it resorts to SJIS, which is only a close approximation. Currently only MySQL-5.0.3 and newer (and MySQL-4.1.12 or .13, depending on when the character set gets backported) can reliably support any variant of CP932.

D.5.3.8. Changes in MySQL Connector/J 3.1.8 (14 April 2005)

Bugs Fixed

- Added finalizers to `ResultSet` and `Statement` implementations to be JDBC spec-compliant, which requires that if not explicitly closed, these resources should be closed upon garbage collection. (Bug #9319)
- Should accept `null` for name patterns in DBMD (meaning "`%`"), even though it isn't JDBC compliant, for legacy's sake. Disable by setting connection property `nullNamePatternMatchesAll` to `false` (which will be the default value in C/J 3.2.x). (Bug #9769)
- Check for empty strings (`''`) when converting `CHAR`/`VARCHAR` column data to numbers, throw exception if `emptyStringsConvertToZero` configuration property is set to `false` (for backward-compatibility with 3.0, it is now set to `true` by default, but will most likely default to `false` in 3.2). (Bug #8803)
- The performance metrics feature now gathers information about number of tables referenced in a SELECT. (Bug #9704)
- Fixed driver not returning `true` for `-1` when `ResultSet.getBoolean()` was called on result sets returned from server-side prepared statements. (Bug #9778)
- `ServerPreparedStatements` now correctly "stream" `BLOB`/`CLOB` data to the server. You can configure the threshold chunk size using the JDBC URL property `blobSendChunkSize` (the default is 1MB). (Bug #8868)
- The logging system is now automatically configured. If the value has been set by the user, using the URL property `logger` or the system property `com.mysql.jdbc.logger`, then use that, otherwise, autodetect it using the following steps:
  1. Log4j, if it is available,
  2. Then JDK1.4 logging,

3. Then fallback to our `STDERR` logging.

(Bug #9704)

- Added a `Manifest.MF` file with implementation information to the `.jar` file. (Bug #9778)
- Should accept `null` for catalog (meaning use current) in DBMD methods, even though it is not JDBC-compliant for legacy's sake. Disable by setting connection property `nullCatalogMeansCurrent` to `false` (which will be the default value in C/J 3.2.x). (Bug #9917)
- More tests in `Field.isOpaqueBinary()` to distinguish opaque binary (that is, fields with type `CHAR(n)` and `CHARACTER SET BINARY`) from output of various scalar and aggregate functions that return strings. (Bug #9778)
- `DBMD.getTables()` shouldn't return tables if views are asked for, even if the database version doesn't support views. (Bug #9778)
- Added support for the c3p0 connection pool's (http://c3p0.sf.net/) validation/connection checker interface which uses the light-weight `COM_PING` call to the server if available. To use it, configure your c3p0 connection pool's `connectionTesterClassName` property to use `com.mysql.jdbc.integration.c3p0.MysqlConnectionTester`. (Bug #9320)
- `DATA_TYPE` column from `DBMD.getBestRowIdentifier()` causes `ArrayIndexOutOfBoundsException` when accessed (and in fact, didn't return any value). (Bug #8803)
- `DATE_FORMAT()` queries returned as `BLOB`s from `getObject()`. (Bug #8868)
- A continuation of Bug #8868, where functions used in queries that should return nonstring types when resolved by temporary tables suddenly become opaque binary strings (work-around for server limitation). Also fixed fields with type of `CHAR(n) CHARACTER SET BINARY` to return correct/matching classes for `RSMD.getColumnClassName()` and `ResultSet.getObject()`. (Bug #9236)
- `PreparedStatement.getMetaData()` inserts blank row in database under certain conditions when not using server-side prepared statements. (Bug #9320)
- Better detection of `LIMIT` inside/outside of quoted strings so that the driver can more correctly determine whether a prepared statement can be prepared on the server or not. (Bug #9320)
- Stored procedures with `DECIMAL` parameters with storage specifications that contained "`,`" in them would fail. (Bug #9682)
- Server-side session variables can be preset at connection time by passing them as a comma-delimited list for the connection property `sessionVariables`. (Bug #8868)
- `Connection.canHandleAsPreparedStatement()` now makes "best effort" to distinguish `LIMIT` clauses with placeholders in them from ones without to have fewer false positives when generating work-arounds for statements the server cannot currently handle as server-side prepared statements. (Bug #9320)
- `BlobFromLocator` now uses correct identifier quoting when generating prepared statements. (Bug #8868)
- `Statement.getMoreResults()` could throw NPE when existing result set was `.close()`d. (Bug #9704)
- `PreparedStatement.addBatch()` doesn't work with server-side prepared statements and streaming `BINARY` data. (Bug #9040)
- Fixed `build.xml` to not compile `log4j` logging if `log4j` not available. (Bug #9320)
- Cannot use `UTF-8` for characterSetResults configuration property. (Bug #9206)
- `PreparedStatement.setObject(int, Object, int type, int scale)` now uses scale value for `BigDecimal` instances. (Bug #9682)
- `DBMD.supportsResultSetConcurrency()` not returning `true` for forward-only/read-only result sets (we obviously support this). (Bug #8792)
- Fixed regression in `ping()` for users using `autoReconnect=true`. (Bug #8868)
- Stored procedures with same name in different databases confuse the driver when it tries to determine parameter counts/types. (Bug #9319)
- `DBMD.supportsMixedCase*Identifiers()` returns wrong value on servers running on case-sensitive file systems. (Bug #8800)

- Fixed `DatabaseMetaData.getTables()` returning views when they were not asked for as one of the requested table types.
- Added support for new precision-math `DECIMAL` type in MySQL 5.0.3 and up.
- Made `Connection.ping()` a public method.
- Fixed `ResultSet.getTime()` on a `NULL` value for server-side prepared statements throws NPE.

D.5.3.9. Changes in MySQL Connector/J 3.1.7 (18 February 2005)

Bugs Fixed

- Infinite recursion when “falling back” to master in failover configuration. (Bug #7952)
- Disable multi-statements (if enabled) for MySQL-4.1 versions prior to version 4.1.10 if the query cache is enabled, as the server returns wrong results in this configuration. (Bug #7952)
- Added support for `BIT` type in MySQL-5.0.3. The driver will treat `BIT(1-8)` as the JDBC standard `BIT` type (which maps to `java.lang.Boolean`), as the server does not currently send enough information to determine the size of a bitfield when < 9 bits are declared. `BIT(>9)` will be treated as `VARBINARY`, and will return `byte[]` when `getObject()` is called. (Bug #8424)
- Added `useLocalSessionState` configuration property, when set to `true` the JDBC driver trusts that the application is well-behaved and only sets autocommit and transaction isolation levels using the methods provided on `java.sql.Connection`, and therefore can manipulate these values in many cases without incurring round-trips to the database server. (Bug #8424)
- Fixed synchronization issue with `ServerPreparedStatement.serverPrepare()` that could cause deadlocks/crashes if connection was shared between threads. (Bug #8096)
- Added `holdResultsOpenOverStatementClose` property (default is `false`), that keeps result sets open over statement.close() or new execution on same statement (suggested by Kevin Burton). (Bug #7715)
- Removed `dontUnpackBinaryResults` functionality, the driver now always stores results from server-side prepared statements as is from the server and unpacks them on demand. (Bug #7952)
- Detect new `sql_mode` variable in string form (it used to be integer) and adjust quoting method for strings appropriately. (Bug #7715)
- Choose correct “direction” to apply time adjustments when both client and server are in GMT time zone when using `ResultSet.get(..., cal)` and `PreparedStatement.set(...., cal)`. (Bug #4718)
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug #7952)
- Remove `_binary` introducer from parameters used as in/out parameters in `CallableStatement`. (Bug #4718)
- Always return `byte[]`s for output parameters registered as `*BINARY`. (Bug #4718)
- Timestamps converted incorrectly to strings with server-side prepared statements and updatable result sets. (Bug #7715)
- By default, the driver now scans SQL you are preparing using all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this by passing `emulateUnsupportedPstmts=false` in your JDBC URL. (Bug #4718)
- Emulated locators corrupt binary data when using server-side prepared statements. (Bug #8096)
- Added `enableStreamingResults()` to `Statement` for connection pool implementations that check `Statement.setFetchSize()` for specification-compliant values. Call `Statement.setFetchSize(>=0)` to disable the streaming results for that statement. (Bug #8424)
- Added `dontTrackOpenResources` option (default is `false`, to be JDBC compliant), which helps with memory use for nonwell-behaved apps (that is, applications that don't close `Statement` objects when they should). (Bug #4718)
- Fixed NPE in `ResultSet.realClose()` when using usage advisor and result set was already closed. (Bug #8428)
- `ResultSet.getBigDecimal()` throws exception when rounding would need to occur to set scale. The driver now

chooses a rounding mode of “half up” if nonrounding `BigDecimal.setScale()` fails. (Bug #8424)

- Send correct value for “boolean” `true` to server for `PreparedStatement.setObject(n, "true", Types.BIT)`. (Bug #4718)
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug #7686)
- `PreparedStatements` not creating streaming result sets. (Bug #8487)
- `ResultSet.getString()` doesn't maintain format stored on server, bug fix only enabled when `noDatetimeStringSync` property is set to `true` (the default is `false`). (Bug #8428)
- Fixed bug with Connection not caching statements from `prepareStatement()` when the statement wasn't a server-side prepared statement. (Bug #4718)
- Don't pass `NULL` to `String.valueOf()` in `ResultSet.getNativeConvertToString()`, as it stringifies it (that is, returns `null`), which is not correct for the method in question. (Bug #8487)

D.5.3.10. Changes in MySQL Connector/J 3.1.6 (23 December 2004)

Bugs Fixed

- `DBMD.getProcedures()` doesn't respect catalog parameter. (Bug #7026)
- Fixed hang on `SocketInputStream.read()` with `Statement.setMaxRows()` and multiple result sets when driver has to truncate result set directly, rather than tacking a `LIMIT n` on the end of it.

D.5.3.11. Changes in MySQL Connector/J 3.1.5 (02 December 2004)

Bugs Fixed

- Removed unwanted new `Throwable()` in `ResultSet` constructor due to bad merge (caused a new object instance that was never used for every result set created). Found while profiling for Bug #6359. (Bug #6225)
- Use 1MB packet for sending file for `LOAD DATA LOCAL INFILE` if that is < `max_allowed_packet` on server. (Bug #6537)
- Use our own implementation of buffered input streams to get around blocking behavior of `java.io.BufferedInputStream`. Disable this with `useReadAheadInput=false`. (Bug #6399)
- Added experimental configuration property `dontUnpackBinaryResults`, which delays unpacking binary result set values until they're asked for, and only creates object instances for nonnumeric values (it is set to `false` by default). For some usecase/jvm combinations, this is friendlier on the garbage collector. (Bug #5706)
- Fixed batched updates with server prepared statements weren't looking if the types had changed for a given batched set of parameters compared to the previous set, causing the server to return the error “Wrong arguments to mysql_stmt_execute()”. (Bug #5235)
- Make auto-deserialization of `java.lang.Objects` stored in `BLOB` columns configurable using `autoDeserialize` property (defaults to `false`). (Bug #6399)
- Don't throw exceptions for `Connection.releaseSavepoint()`. (Bug #5706)
- `ServerSidePreparedStatement` allocating short-lived objects unnecessarily. (Bug #6225)
- Inefficient detection of pre-existing string instances in `ResultSet.getNativeString()`. (Bug #5706)
- `UNSIGNED BIGINT` unpacked incorrectly from server-side prepared statement result sets. (Bug #5729)
- Use null-safe-equals for key comparisons in updatable result sets. (Bug #6225)
- Failing to connect to the server when one of the addresses for the given host name is IPV6 (which the server does not yet bind on). The driver now loops through *all* IP addresses for a given host, and stops on the first one that `accepts()` a `socket.connect()`. (Bug #6348)
- `ResultSetMetaData.getColumnDisplaySize()` returns incorrect values for multi-byte charsets. (Bug #6399)

- `SUM()` on `DECIMAL` with server-side prepared statement ignores scale if zero-padding is needed (this ends up being due to conversion to `DOUBLE` by server, which when converted to a string to parse into `BigDecimal`, loses all “padding” zeros). (Bug #6537)
- Use a per-session `Calendar` instance by default when decoding dates from `ServerPreparedStatements` (set to old, less performant behavior by setting property `dynamicCalendars=true`). (Bug #5706)
- Handle case when string representation of timestamp contains trailing “`.`” with no numbers following it. (Bug #5235)
- Use `DatabaseMetaData.getIdentifierQuoteString()` when building DBMD queries. (Bug #6537)
- Re-work `Field.isOpaqueBinary()` to detect `CHAR(n) CHARACTER SET BINARY` to support fixed-length binary fields for `ResultSet.getObject()`. (Bug #6399)
- Server-side prepared statements did not honor `zeroDateTimeBehavior` property, and would cause class-cast exceptions when using `ResultSet.getObject()`, as the all-zero string was always returned. (Bug #5235)
- Fixed too-early creation of `StringBuffer` in `EscapeProcessor.escapeSQL()`, also return `String` when escaping not needed (to avoid unnecessary object allocations). Found while profiling for Bug #6359. (Bug #6225)
- Fix comparisons made between string constants and dynamic strings that are converted with either `toUpperCase()` or `toLowerCase()` to use `Locale.ENGLISH`, as some locales “override” case rules for English. Also use `StringUtils.indexOfIgnoreCase()` instead of `.toUpperCase().indexOf()`, avoids creating a very short-lived transient `String` instance.

D.5.3.12. Changes in MySQL Connector/J 3.1.4 (04 September 2004)

Bugs Fixed

- Fixed `ServerPreparedStatement` to read prepared statement metadata off the wire, even though it is currently a placeholder instead of using `MysqlIO.clearInputStream()` which didn't work at various times because data wasn't available to read from the server yet. This fixes sporadic errors users were having with `ServerPreparedStatements` throwing `ArrayIndexOutOfBoundExceptions`. (Bug #5032)
- Optimized integer number parsing, enable “old” slower integer parsing using JDK classes using `useFastIntParsing=false` property. (Bug #4642)
- Track packet sequence numbers if `enablePacketDebug=true`, and throw an exception if packets received out-of-order. (Bug #4689)
- `ResultSet.wasNull()` does not work for primitives if a previous `null` was returned. (Bug #4689)
- Added three ways to deal with all-zero datetimes when reading them from a `ResultSet`: `exception` (the default), which throws an `SQLException` with an SQLState of `S1009`; `convertToNull`, which returns `NULL` instead of the date; and `round`, which rounds the date to the nearest closest value which is `'0001-01-01'`. (Bug #5032)
- Added `useOnlyServerErrorMessages` property, which causes message text in exceptions generated by the server to only contain the text sent by the server (as opposed to the SQLState's “standard” description, followed by the server's error message). This property is set to `true` by default. (Bug #4642)
- The driver is more strict about truncation of numerics on `ResultSet.get*()`, and will throw an `SQLException` when truncation is detected. You can disable this by setting `jdbcCompliantTruncation` to `false` (it is enabled by default, as this functionality is required for JDBC compliance). (Bug #5032)
- `ResultSet.getObject()` returns wrong type for strings when using prepared statements. (Bug #4482)
- `ServerPreparedStatements` dealing with return of `DECIMAL` type don't work. (Bug #5012)
- Calling `MysqlPooledConnection.close()` twice (even though an application error), caused NPE. Fixed. (Bug #4482)
- Connector/J 3.1.3 beta does not handle integers correctly (caused by changes to support unsigned reads in `Buffer.readInt()` -> `Buffer.readShort()`). (Bug #4510)
- You can now use URLs in `LOAD DATA LOCAL INFILE` statements, and the driver will use Java's built-in handlers for retrieving the data and sending it to the server. This feature is not enabled by default, you must set the `allowUrlInLocalInfile` connection property to `true`. (Bug #5032)
- Added support in `DatabaseMetaData.getTables()` and `getTableTypes()` for views, which are now available in MySQL server 5.0.x. (Bug #4510)

- `ServerPreparedStatement.execute*()` sometimes threw `ArrayIndexOutOfBoundsException` when unpacking field metadata. (Bug #4642)
- `ResultSet.getObject()` doesn't return type `Boolean` for pseudo-bit types from prepared statements on 4.1.x (shortcut for avoiding extra type conversion when using binary-encoded result sets obscured test in `getObject()` for "pseudo" bit type). (Bug #5032)
- Use `com.mysql.jdbc.Message`'s classloader when loading resource bundle, should fix sporadic issues when the caller's classloader can't locate the resource bundle. (Bug #5032)

D.5.3.13. Changes in MySQL Connector/J 3.1.3 (07 July 2004)

Bugs Fixed

- Externalized more messages (on-going effort). (Bug #4119)
- Support new time zone variables in MySQL-4.1.3 when `useTimezone=true`. (Bug #4311)
- Null bitmask sent for server-side prepared statements was incorrect. (Bug #4119)
- Added constants for MySQL error numbers (publicly accessible, see `com.mysql.jdbc.MysqlErrorNumbers`), and the ability to generate the mappings of vendor error codes to SQLStates that the driver uses (for documentation purposes). (Bug #4119)
- Added packet debugging code (see the `enablePacketDebug` property documentation). (Bug #4119)
- Error in retrieval of `mediumint` column with prepared statements and binary protocol. (Bug #4311)
- Use SQL Standard SQL states by default, unless `useSqlStateCodes` property is set to `false`. (Bug #4119)
- Support for unsigned numerics as return types from prepared statements. This also causes a change in `ResultSet.getObject()` for the `bigint unsigned` type, which used to return `BigDecimal` instances, it now returns instances of `java.lang.BigInteger`. (Bug #4311)
- Added support for `INOUT` parameters in `CallableStatements`.
- Mangle output parameter names for `CallableStatements` so they will not clash with user variable names.

D.5.3.14. Changes in MySQL Connector/J 3.1.2 (09 June 2004)

Bugs Fixed

- Fixed `DatabaseMetaData.getProcedures()` when run on MySQL-5.0.0 (output of `SHOW PROCEDURE STATUS` changed between 5.0.0 and 5.0.1. (Bug #3520)
- Fixed case when no output parameters specified for a stored procedure caused a bogus query to be issued to retrieve out parameters, leading to a syntax error from the server.
- Correctly map output parameters to position given in `prepareCall()` versus. order implied during `registerOutParameter()`. (Bug #3146)
- Added `connectionCollation` property to cause driver to issue `set collation_connection=...` query on connection init if default collation for given charset is not appropriate. (Bug #3520)
- `ServerPreparedStatements` weren't actually de-allocating server-side resources when `.close()` was called.
- Don't enable server-side prepared statements for server version 5.0.0 or 5.0.1, as they aren't compatible with the '4.1.2+' style that the driver uses (the driver expects information to come back that isn't there, so it hangs). (Bug #3804)
- `getProcedures()` does not return any procedures in result set. (Bug #3539)
- Fixed stored procedure parameter parsing info when size was specified for a parameter (for example, `char()`, `varchar()`).
- Removed wrapping of exceptions in `MysqlIO.changeUser()`.
- `getWarnings()` returns `SQLWarning` instead of `DataTruncation`. (Bug #3804)

- Cleaned up detection of server properties. (Bug #3146)
- Correctly detect initial character set for servers >= 4.1.0. (Bug #3146)
- Support placeholder for parameter metadata for server >= 4.1.2. (Bug #3146)
- Added `logSlowQueries` property, along with `slowQueriesThresholdMillis` property to control when a query should be considered "slow."
- Added `.toString()` functionality to `ServerPreparedStatement`, which should help if you're trying to debug a query that is a prepared statement (it shows SQL as the server would process).
- Fixed sending of split packets for large queries, enabled nio ability to send large packets as well.
- Enabled callable statement caching using `cacheCallableStmts` property.
- Fixed case when no parameters could cause a `NullPointerException` in `CallableStatement.setOutputParameters()`.
- Added `gatherPerformanceMetrics` property, along with properties to control when/where this info gets logged (see docs for more info).
- `DBMD.getSQLStateType()` returns incorrect value. (Bug #3520)
- `getProcedureColumns()` doesn't work with wildcards for procedure name. (Bug #3540)

D.5.3.15. Changes in MySQL Connector/J 3.1.1 (14 February 2004, alpha)

Bugs Fixed

- Fixed charset conversion issue in `getTables()`. (Bug #2502)
- Fixed `ConnectionProperties` that weren't properly exposed through accessors, cleaned up `ConnectionProperties` code. (Bug #2623)
- Prepared `Statements` will be re-prepared on auto-reconnect. Any errors encountered are postponed until first attempt to re-execute the re-prepared statement.
- Reduced number of methods called in average query to be more efficient.
- Refactored how connection properties are set and exposed as `DriverPropertyInfo` as well as `Connection` and `DataSource` properties.
- Fixed stack overflow in `Connection.prepareCall()` (bad merge).
- Enabled streaming of result sets from server-side prepared statements. (Bug #2606)
- Allow contents of `PreparedStatement.setBlob()` to be retained between calls to `.execute*()`.
- Fixed `IllegalAccessError` to `Calendar.getTimeInMillis()` in `DateTimeValue` (for JDK < 1.4).
- Default result set type changed to `TYPE_FORWARD_ONLY` (JDBC compliance).
- Fixed bug with `UpdatableResultSets` not using client-side prepared statements.
- Class-cast exception when using scrolling result sets and server-side prepared statements. (Bug #2623)
- Display where/why a connection was implicitly closed (to aid debugging). (Bug #1673)
- `DatabaseMetaData.getColumns()` is not returning correct column ordinal info for non-`'%'` column name patterns. (Bug #1673)
- Centralized setting of result set type and concurrency.
- Implemented `Connection.prepareCall()`, and `DatabaseMetaData`. `getProcedures()` and `getProcedureColumns()`. (Bug #2359)
- Implemented multiple result sets returned from a statement or stored procedure. (Bug #2502)
- Fixed `NullPointerException` in `ServerPreparedStatement.setTimestamp()`, as well as year and month dis-

crepencies in `ServerPreparedStatement.setTimestamp()`, `setDate()`. (Bug #1673)

- Fixed character encoding issues when converting bytes to ASCII when MySQL doesn't provide the character set, and the JVM is set to a multi-byte encoding (usually affecting retrieval of numeric values).
- Support “old” `profileSql` capitalization in `ConnectionProperties`. This property is deprecated, you should use `profileSQL` if possible.
- Added ability to have multiple database/JVM targets for compliance and regression/unit tests in `build.xml`. (Bug #1673)
- Support for transaction savepoints (MySQL >= 4.0.14 or 4.1.1).
- Check for closed connection on delete/update/insert row operations in `UpdatableResultSet`.
- Support for NIO. Use `useNIO=true` on platforms that support NIO.
- Fixed sending of queries larger than 16M. (Bug #1673)
- Use DocBook version of docs for shipped versions of drivers. (Bug #2671)
- Merged fix of data type mapping from MySQL type `FLOAT` to `java.sql.Types.REAL` from 3.0 branch. (Bug #1673)
- Merged prepared statement caching, and `.getMetaData()` support from 3.0 branch. (Bug #2359)
- Fixed NPE and year/month bad conversions when accessing some datetime functionality in `ServerPreparedStatements` and their resultant result sets. (Bug #1673)
- Removed `useFastDates` connection property.
- Added named and indexed input/output parameter support to `CallableStatement`. MySQL-5.0.x or newer. (Bug #1673)
- Fixed off-by-1900 error in some cases for years in `TimeUtil.fastDate`/`TimeCreate()` when unpacking results from server-side prepared statements. (Bug #2359)
- Support for `mysql_change_user()`. See the `changeUser()` method in `com.mysql.jdbc.Connection`.
- `DatabaseMetaData` now reports `supportsStoredProcedures()` for MySQL versions >= 5.0.0
- Deal with 0-length tokens in `EscapeProcessor` (caused by callable statement escape syntax).
- Reset `long binary` parameters in `ServerPreparedStatement` when `clearParameters()` is called, by sending `COM_RESET_STMT` to the server. (Bug #2359)
- Server-side prepared statements were not returning data type `YEAR` correctly. (Bug #2606)
- `NULL` fields were not being encoded correctly in all cases in server-side prepared statements. (Bug #2671)
- Implemented long data (Blobs, Clobs, InputStreams, Readers) for server prepared statements.
- Correctly initialize datasource properties from JNDI Refs, including explicitly specified URLs.
- Ensure that warnings are cleared before executing queries on prepared statements, as-per JDBC spec (now that we support warnings).
- Implemented `Statement.getWarnings()` for MySQL-4.1 and newer (using `SHOW WARNINGS`).
- Unpack “unknown” data types from server prepared statements as `Strings`.
- `NULL` values for numeric types in binary encoded result sets causing `NullPointerExceptions`. (Bug #2359)
- `CommunicationsException` implemented, that tries to determine why communications was lost with a server, and displays possible reasons when `.getMessage()` is called. (Bug #1673)
- Fixed rare buffer underflow when writing numbers into buffers for sending prepared statement execution requests. (Bug #2671)
- Fix support for table aliases when checking for all primary keys in `UpdatableResultSet`.
- Optimized `Buffer.readLenByteArray()` to return shared empty byte array when length is 0.
- Detect collation of column for `RSMD.isCaseSensitive()`. (Bug #1673)
- Merged unbuffered input code from 3.0. (Bug #2623)

D.5.3.16. Changes in MySQL Connector/J 3.1.0 (18 February 2003, alpha)

Bugs Fixed

- Track open `Statements`, close all when `Connection.close()` is called (JDBC compliance).
- Added `requireSSL` property.
- Added `useServerPrepStmts` property (default `false`). The driver will use server-side prepared statements when the server version supports them (4.1 and newer) when this property is set to `true`. It is currently set to `false` by default until all bind/fetch functionality has been implemented. Currently only DML prepared statements are implemented for 4.1 server-side prepared statements.

D.5.4. Changes in MySQL Connector/J 3.0.x

D.5.4.1. Changes in MySQL Connector/J 3.0.17 (23 June 2005)

Bugs Fixed

- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug #7061)
- Workaround for server Bug #9098: Default values of `CURRENT_*` for `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` columns can't be distinguished from `string` values, so `UpdatableResultSet.moveToInsertRow()` generates bad SQL for inserting default values. (Bug #8812)
- Handle streaming result sets with more than 2 billion rows properly by fixing wraparound of row number counter. (Bug #7601)
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug #7952)
- Statements created from a pooled connection were returning physical connection instead of logical connection when `getConnection()` was called. (Bug #7316)
- `MS932`, `SHIFT_JIS`, and `Windows_31J` not recognized as aliases for `sjis`. (Bug #7607)
- `EUCKR` charset is sent as `SET NAMES euc_kr` which MySQL-4.1 and newer doesn't understand. (Bug #8629)
- Support new protocol type `MYSQL_TYPE_VARCHAR`. (Bug #7081)
- Connections starting up failed-over (due to down master) never retry master. (Bug #6966)
- `PreparedStatements` don't encode Big5 (and other multi-byte) character sets correctly in static SQL strings. (Bug #7033)
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug #7601)
- Backported SQLState codes mapping from Connector/J 3.1, enable with `useSqlStateCodes=true` as a connection property, it defaults to `false` in this release, so that we don't break legacy applications (it defaults to `true` starting with Connector/J 3.1). (Bug #7686)
- Added `useOldUTF8Behavior`' configuration property, which causes JDBC driver to act like it did with MySQL-4.0.x and earlier when the character encoding is `utf-8` when connected to MySQL-4.1 or newer. (Bug #7081)
- Escape sequence {fn convert(..., type)} now supports ODBC-style types that are prepended by `SQL_`. (Bug #7601)
- Added support for the `EUC_JP_Solaris` character encoding, which maps to a MySQL encoding of `eucjpms` (backported from 3.1 branch). This only works on servers that support `eucjpms`, namely 5.0.3 or later. (Bug #8629)
- `NON_UNIQUE` column from `DBMD.getIndexInfo()` returned inverted value. (Bug #8812)
- Use hex escapes for `PreparedStatement.setBytes()` for double-byte charsets including “aliases” `Windows-31J`, `CP934`, `MS932`. (Bug #8629)
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug #7686)
- `DatabaseMetaData.getIndexInfo()` ignored `unique` parameter. (Bug #7081)

- `DatabaseMetaData.supportsSelectForUpdate()` returns correct value based on server version. (Bug #8629)
- Which requires hex escaping of binary data when using multi-byte charsets with prepared statements. (Bug #8064)
- `Timestamp`/`Time` conversion goes in the wrong "direction" when `useTimeZone=true` and server time zone differs from client time zone. (Bug #5874)
- Adding `CP943` to aliases for `sjis`. (Bug #6549, Bug #7607)

D.5.4.2. Changes in MySQL Connector/J 3.0.16 (15 November 2004)

Bugs Fixed

- Made `TINYINT(1)` -> `BIT`/`Boolean` conversion configurable using `tinyInt1isBit` property (default `true` to be JDBC compliant out of the box). (Bug #5664)
- Off-by-one bug in `Buffer.readString(`*`string`*`)`. (Bug #5664)
- `ResultSet.updateByte()` when on insert row throws `ArrayOutOfBoundsException`. (Bug #5664)
- Fixed regression where `useUnbufferedInput` was defaulting to `false`. (Bug #5664)
- `ResultSet.getTimestamp()` on a column with `TIME` in it fails. (Bug #5664)
- Fixed `DatabaseMetaData.getTypes()` returning incorrect (this is, nonnegative) scale for the `NUMERIC` type. (Bug #5664)
- Only set `character_set_results` during connection establishment if server version >= 4.1.1. (Bug #5664)
- Re-issue character set configuration commands when re-using pooled connections or `Connection.changeUser()` when connected to MySQL-4.1 or newer.
- Fixed `ResultSetMetaData.isReadOnly()` to detect nonwritable columns when connected to MySQL-4.1 or newer, based on existence of "original" table and column names.

D.5.4.3. Changes in MySQL Connector/J 3.0.15 (04 September 2004)

Bugs Fixed

- Calling `.close()` twice on a `PooledConnection` causes NPE. (Bug #4808)
- "Production" is now "GA" (General Availability) in naming scheme of distributions. (Bug #4860, Bug #4138)
- `DOUBLE` mapped twice in `DBMD.getTypeInfo()`. (Bug #4742)
- Removed redundant calls to `checkRowPos()` in `ResultSet`. (Bug #4334)
- `DBMD.getColumns()` returns incorrect JDBC type for unsigned columns. This affects type mappings for all numeric types in the `RSMD.getColumnType()` and `RSMD.getColumnTypeNames()` methods as well, to ensure that "like" types from `DBMD.getColumns()` match up with what `RSMD.getColumnType()` and `getColumnTypeNames()` return. (Bug #4860, Bug #4138)
- `ResultSet.getMetaData()` should not return incorrectly initialized metadata if the result set has been closed, but should instead throw an `SQLException`. Also fixed for `getRow()` and `getWarnings()` and traversal methods by calling `checkClosed()` before operating on instance-level fields that are nullified during `.close()`. (Bug #5069)
- `RSMD.getPrecision()` returning 0 for nonnumeric types (should return max length in chars for nonbinary types, max length in bytes for binary types). This fix also fixes mapping of `RSMD.getColumnType()` and `RSMD.getColumnTypeName()` for the `BLOB` types based on the length sent from the server (the server doesn't distinguish between `TINYBLOB`, `BLOB`, `MEDIUMBLOB` or `LONGBLOB` at the network protocol level). (Bug #4880)
- Added FLOSS license exemption. (Bug #4742)
- `ResultSet` should release `Field[]` instance in `.close()`. (Bug #5022)
- Failover for `autoReconnect` not using port numbers for any hosts, and not retrying all hosts.

> **Warning**
>
> This required a change to the `SocketFactory connect()` method signature, which is now `public Socket connect(String host, int portNumber, Properties props)`; therefore, any third-party socket factories will have to be changed to support this signature.

(Bug #4334)

- Use `_binary` introducer for `PreparedStatement.setBytes()` and `set*Stream()` when connected to MySQL-4.1.x or newer to avoid misinterpretation during character conversion. (Bug #5069)
- Logical connections created by `MysqlConnectionPoolDataSource` will now issue a `rollback()` when they are closed and sent back to the pool. If your application server/connection pool already does this for you, you can set the `rollbackOnPooledClose` property to `false` to avoid the overhead of an extra `rollback()`. (Bug #4334)
- Parse new time zone variables from 4.1.x servers. (Bug #5069)
- `StringUtils.escapeEasternUnicodeByteStream` was still broken for GBK. (Bug #4010)

D.5.4.4. Changes in MySQL Connector/J 3.0.14 (28 May 2004)

Bugs Fixed

- Fixed URL parsing error.

D.5.4.5. Changes in MySQL Connector/J 3.0.13 (27 May 2004)

Bugs Fixed

- Using a `MySQLDatasource` without server name fails. (Bug #3848)
- `PreparedStatement.getGeneratedKeys()` method returns only 1 result for batched insertions. (Bug #3873)
- `No Database Selected` when using `MysqlConnectionPoolDataSource`. (Bug #3920)

D.5.4.6. Changes in MySQL Connector/J 3.0.12 (18 May 2004)

Bugs Fixed

- Backported “change user” and “reset server state” functionality from 3.1 branch, to enable clients of `MysqlConnectionPoolDataSource` to reset server state on `getConnection()` on a pooled connection.
- Made `StringRegressionTest` 4.1-unicode aware. (Bug #3520)
- Use `SET character_set_results` during initialization to enable any charset to be returned to the driver for result sets. (Bug #2670)
- Fixed regression in `PreparedStatement.setString()` and eastern character encodings. (Bug #3520)
- Don't truncate `BLOB` or `CLOB` values when using `setBytes()` and `setBinary/CharacterStream()`. (Bug #2670)
- Map duplicate key and foreign key errors to SQLState of `23000`.
- Allow `java.util.Date` to be sent in as parameter to `PreparedStatement.setObject()`, converting it to a `Timestamp` to maintain full precision. . (Bug #103)
- Add unsigned attribute to `DatabaseMetaData.getColumns()` output in the `TYPE_NAME` column.
- Not specifying database in URL caused `MalformedURL` exception. (Bug #3554)
- Added `failOverReadOnly` property, to enable the user to configure the state of the connection (read-only/writable) when failed over.
- Dynamically configure character set mappings for field-level character sets on MySQL-4.1.0 and newer using `SHOW COLLA-`

TION when connecting. (Bug #2670)

- Map binary character set to US-ASCII to support DATETIME charset recognition for servers >= 4.1.2. (Bug #2670)
- Inconsistent reporting of data type. The server still doesn't return all types for *BLOBs *TEXT correctly, so the driver won't return those correctly. (Bug #3570)
- Auto-convert MySQL encoding names to Java encoding names if used for characterEncoding property. (Bug #3554)
- Backport documentation tooling from 3.1 branch.
- Use junit.textui.TestRunner for all unit tests (to enable them to be run from the command line outside of Ant or Eclipse). (Bug #3554)
- Renamed StringUtils.escapeSJISByteStream() to more appropriate escapeEasternUnicodeByteStream(). (Bug #3511)
- Use charsetnr returned during connect to encode queries before issuing SET NAMES on MySQL >= 4.1.0. (Bug #2670)
- StringUtils.escapeSJISByteStream() not covering all eastern double-byte charsets correctly. (Bug #3511)
- DBMD.getSQLStateType() returns incorrect value. (Bug #3520)
- Add helper methods to ResultSetMetaData (getColumnCharacterEncoding() and getColumnCharacterSet()) to permit end users to see what charset the driver thinks it should be using for the column. (Bug #2670)
- Don't escape SJIS/GBK/BIG5 when using MySQL-4.1 or newer.
- Added encoding names that are recognized on some JVMs to fix case where they were reverse-mapped to MySQL encoding names incorrectly. (Bug #3554)
- Only set character_set_results for MySQL >= 4.1.0. (Bug #2670)
- Return creating statement for ResultSets created by getGeneratedKeys(). (Bug #2957)
- UpdatableResultSet not picking up default values for moveToInsertRow(). (Bug #3557)
- Allow url parameter for MysqlDataSource and MysqlConnectionPool DataSource so that passing of other properties is possible from inside appservers.

D.5.4.7. Changes in MySQL Connector/J 3.0.11 (19 February 2004)

Bugs Fixed

- Return java.lang.Integer for TINYINT and SMALLINT types from ResultSetMetaData.getColumnClassName(). (Bug #2852)
- Return java.lang.Double for FLOAT type from ResultSetMetaData.getColumnClassName(). (Bug #2855)
- Added useUnbufferedInput parameter, and now use it by default (due to JVM issue http://developer.java.sun.com/developer/bugParade/bugs/4401235.html) (Bug #2578)
- AutoReconnect time was growing faster than exponentially. (Bug #2447)
- Fixed failover always going to last host in list. (Bug #2578)
- Detect on/off or 1, 2, 3 form of lower_case_table_names value on server. (Bug #2578)
- Return [B instead of java.lang.Object for BINARY, VARBINARY and LONGVARBINARY types from ResultSetMetaData.getColumnClassName() (JDBC compliance). (Bug #2855)
- Issue connection events on all instances created from a ConnectionPoolDataSource. (Bug #2855)
- Trigger a SET NAMES utf8 when encoding is forced to utf8 *or* utf-8 using the characterEncoding property. Previously, only the Java-style encoding name of utf-8 would trigger this.

D.5.4.8. Changes in MySQL Connector/J 3.0.10 (13 January 2004)

Bugs Fixed

- Fixed regression of `Statement.getGeneratedKeys()` and `REPLACE` statements. (Bug #1576)
- Implement `ResultSet.updateClob()`. (Bug #1913)
- Enable caching of the parsing stage of prepared statements using the `cachePrepStmts`, `prepStmtCacheSize`, and `prepStmtCacheSqlLimit` properties (disabled by default). (Bug #2006)
- Foreign Keys column sequence is not consistent in `DatabaseMetaData.getImported/Exported/CrossReference()`. (Bug #1731)
- Subsequent call to `ResultSet.updateFoo()` causes NPE if result set is not updatable. (Bug #1630)
- Backported fix for aliased tables and `UpdatableResultSets` in `checkUpdatability()` method from 3.1 branch. (Bug #1534)
- Fixed security exception when used in Applets (applets can't read the system property `file.encoding` which is needed for `LOAD DATA LOCAL INFILE`). (Bug #2006)
- Speed up parsing of `PreparedStatements`, try to use one-pass whenever possible. (Bug #2006)
- Support escape sequence {fn convert ... }. (Bug #1914)
- Autoreconnect code didn't set catalog upon reconnect if it had been changed. (Bug #1913)
- Fixed exception `Unknown character set 'danish'` on connect with JDK-1.4.0 (Bug #2006)
- Fixed mappings in SQLError to report deadlocks with SQLStates of `41000`. (Bug #2006)
- `ResultSet.getObject()` on `TINYINT` and `SMALLINT` columns should return Java type `Integer`. (Bug #1913)
- `ArrayIndexOutOfBounds` when parameter number == number of parameters + 1. (Bug #1958)
- Added more descriptive error message `Server Configuration Denies Access to DataSource`, as well as retrieval of message from server. (Bug #1913)
- “Friendlier” exception message for `PacketTooLargeException`. (Bug #1534)
- Don't count quoted IDs when inside a 'string' in `PreparedStatement` parsing. (Bug #1511)
- Removed static synchronization bottleneck from instance factory method of `SingleByteCharsetConverter`. (Bug #2006)
- Removed static synchronization bottleneck from `PreparedStatement.setTimestamp()`. (Bug #2006)
- `ResultSet.findColumn()` should use first matching column name when there are duplicate column names in `SELECT` query (JDBC-compliance). (Bug #2006)
- `maxRows` property would affect internal statements, so check it for all statement creation internal to the driver, and set to 0 when it is not. (Bug #2006)
- Barge blobs and split packets not being read correctly. (Bug #1576)
- `ResultSetMetaData.isCaseSensitive()` returned wrong value for `CHAR`/`VARCHAR` columns. (Bug #1913)
- `DatabaseMetaData.getSystemFunction()` returning bad function `VResultsSion`. (Bug #1775)
- Use constants for SQLStates. (Bug #2006)
- Fix for 4.1.1-style authentication with no password. (Bug #1630)
- Cross-database updatable result sets are not checked for updatability correctly. (Bug #1592)
- Statements being created too many times in `DBMD.extractForeignKeyFromCreateTable()`. (Bug #1925)
- Map charset `ko18_ru` to `ko18r` when connected to MySQL-4.1.0 or newer. (Bug #2006)
- Fix for `ArrayIndexOutOfBounds` exception when using `Statement.setMaxRows()`. (Bug #1695)
- Connection property `maxRows` not honored. (Bug #1933)

- Added `alwaysClearStream` connection property, which causes the driver to always empty any remaining data on the input stream before each query. (Bug #1913)
- `DatabaseMetaData.getColumns()` should return `Types.LONGVARCHAR` for MySQL `LONGTEXT` type. (Bug #1592)
- Ensure that `Buffer.writeString()` saves room for the `\0`. (Bug #2006)

D.5.4.9. Changes in MySQL Connector/J 3.0.9 (07 October 2003)

Bugs Fixed

- Issue exception on `ResultSet.get*XXX*()` on empty result set (wasn't caught in some cases). (Bug #848)
- Made `databaseName`, `portNumber`, and `serverName` optional parameters for `MysqlDataSourceFactory`. (Bug #1246)
- `ResultSet.get/setString` mashing char 127. (Bug #1247)
- Double-escaping of `'\'` when charset is SJIS or GBK and `'\'` appears in nonescaped input. (Bug #879)
- Don't hide messages from exceptions thrown in I/O layers. (Bug #848)
- Support `InnoDB` constraint names when extracting foreign key information in `DatabaseMetaData` (implementing ideas from Parwinder Sekhon). (Bug #664, Bug #517)
- Fixed `CLOB.truncate()`. (Bug #1130)
- Fixed `ResultSet.previous()` behavior to move current position to before result set when on first row of result set. (Bug #496)
- Backported 4.1 protocol changes from 3.1 branch (server-side SQL states, new field information, larger client capability flags, connect-with-database, and so forth). (Bug #664, Bug #517)
- Fixed `Statement` and `PreparedStatement` issuing bogus queries when `setMaxRows()` had been used and a `LIMIT` clause was present in the query. (Bug #496)
- Added property to “clobber” streaming results, by setting the `clobberStreamingResults` property to `true` (the default is `false`). This will cause a “streaming” `ResultSet` to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server. (Bug #1247)
- When emptying input stream of unused rows for “streaming” result sets, have the current thread `yield()` every 100 rows to not monopolize CPU time. (Bug #879)
- Fixed deadlock issue with `Statement.setMaxRows()`. (Bug #1099)
- Don't wrap `SQLExceptions` in `RowDataDynamic`. (Bug #688)
- Added `com.mysql.jdbc.util.BaseBugReport` to help creation of testcases for bug reports. (Bug #1247)
- Clip +/- INF (to smallest and largest representative values for the type in MySQL) and NaN (to 0) for `setDouble`/`setFloat()`, and issue a warning on the statement when the server does not support +/- INF or NaN. (Bug #884)
- Don't try and reset isolation level on reconnect if MySQL doesn't support them. (Bug #688)
- `DatabaseMetaData.getColumns()` getting confused about the keyword “set” in character columns. (Bug #1099)
- Fixed regression in large split-packet handling. (Bug #848)
- Fixed test for end of buffer in `Buffer.readString()`.
- The `insertRow` in an `UpdatableResultSet` is now loaded with the default column values when `moveToInsertRow()` is called. (Bug #688)
- Better diagnostic error messages in exceptions for “streaming” result sets. (Bug #848)
- Backported authentication changes for 4.1.1 and newer from 3.1 branch. (Bug #1247)
- `DatabaseMetaData.getColumns()` wasn't returning `NULL` for default values that are specified as `NULL`. (Bug #688)

- Don't change timestamp TZ twice if `useTimezone==true`. (Bug #774)
- `refreshRow` didn't work when primary key values contained values that needed to be escaped (they ended up being doubly escaped). (Bug #661)
- Fix `UpdatableResultSet` to return values for `getXXX()` when on insert row. (Bug #675)
- Don't fire connection closed events when closing pooled connections, or on `PooledConnection.getConnection()` with already open connections. (Bug #884)
- Change default statement type/concurrency to `TYPE_FORWARD_ONLY` and `CONCUR_READ_ONLY` (spec compliance). (Bug #688)
- Faster date handling code in `ResultSet` and `PreparedStatement` (no longer uses `Date` methods that synchronize on static calendars).
- Optimized `CLOB.setChracterStream()`. (Bug #1131)

D.5.4.10. Changes in MySQL Connector/J 3.0.8 (23 May 2003)

Bugs Fixed

- Fixed SJIS encoding bug, thanks to Naoto Sato. (Bug #378)
- Allow bogus URLs in `Driver.getPropertyInfo()`.
- Fix problem detecting server character set in some cases. (Bug #378)
- Allow multiple calls to `Statement.close()`. (Bug #378)
- Return correct number of generated keys when using `REPLACE` statements. (Bug #378)
- Unicode character 0xFFFF in a string would cause the driver to throw an `ArrayOutOfBoundsException`. . (Bug #378)
- Return list of generated keys when using multi-value `INSERTS` with `Statement.getGeneratedKeys()`.
- Fixed result set not getting set for `Statement.executeUpdate()`, which affected `getGeneratedKeys()` and `getUpdateCount()` in some cases.
- Changed Ant target `compile-core` to `compile-driver`, and made testsuite compilation a separate target.
- Fix infinite loop with `Connection.cleanup()`.
- Fix row data decoding error when using *very* large packets. (Bug #378)
- Optimized row data decoding. (Bug #378)
- Use JVM charset with file names and `LOAD DATA [LOCAL] INFILE`.
- Issue exception when operating on an already closed prepared statement. (Bug #378)
- Optimized usage of `EscapeProcessor`. (Bug #378)

D.5.4.11. Changes in MySQL Connector/J 3.0.7 (08 April 2003)

Bugs Fixed

- Throw `SQLExceptions` when trying to do operations on a forcefully closed `Connection` (that is, when a communication link failure occurs).
- Fixed `ResultSet.getTimestamp()` when underlying field is of type `DATE`.
- Fixed escaping of 0x5c (`'\'`) character for GBK and Big5 charsets.
- Don't reset `Connection.isReadOnly()` when autoReconnecting.
- Ensure that packet size from `alignPacketSize()` does not exceed `max_allowed_packet` (JVM bug)

- Don't pick up indexes that start with `pri` as primary keys for `DBMD.getPrimaryKeys()`.
- Fixed `LOAD DATA LOCAL INFILE` bug when file > `max_allowed_packet`.
- Updatable `ResultSets` can now be created for aliased tables/columns when connected to MySQL-4.1 or newer.
- Fixed missing conversion for `YEAR` type in `ResultSetMetaData.getColumnTypeName()`.
- Remove synchronization from `Driver.connect()` and `Driver.acceptsUrl()`.
- `IOExceptions` during a transaction now cause the `Connection` to be closed.
- Fixed `StringIndexOutOfBoundsException` in `PreparedStatement.setClob()`.
- Fixed `MysqlPooledConnection.close()` calling wrong event type.
- 4.1 Column Metadata fixes.
- You can now toggle profiling on/off using `Connection.setProfileSql(boolean)`.
- Fixed charset issues with database metadata (charset was not getting set correctly).

D.5.4.12. Changes in MySQL Connector/J 3.0.6 (18 February 2003)

Bugs Fixed

- Add “window” of different `NULL` sorting behavior to `DBMD.nullsAreSortedAtStart` (4.0.2 to 4.0.10, true; otherwise, no).
- Implemented `Blob.setBytes()`. You still need to pass the resultant `Blob` back into an updatable `ResultSet` or `PreparedStatement` to persist the changes, because MySQL does not support “locators”.
- More checks added in `ResultSet` traversal method to catch when in closed state.
- Fixed `ResultSetMetaData.isWritable()` to return correct value.
- Clean up `Statement` query/method mismatch tests (that is, `INSERT` not permitted with `.executeQuery()`).
- Allow ignoring of warning for “non transactional tables” during rollback (compliance/usability) by setting `ignoreNonTxTables` property to `true`.
- Fixed `ResultSetMetaData` to return `""` when catalog not known. Fixes `NullPointerExceptions` with Sun's `CachedRowSet`.
- Fixed `SQLExceptions` getting swallowed on initial connect.
- Fixed `DBMD.getTypeInfo()` and `DBMD.getColumns()` returning different value for precision in `TEXT` and `BLOB` types.
- Fixed `Statement.setMaxRows()` to stop sending `LIMIT` type queries when not needed (performance).
- Backported 4.1 charset field info changes from Connector/J 3.1.

D.5.4.13. Changes in MySQL Connector/J 3.0.5 (22 January 2003)

Bugs Fixed

- Greatly reduce memory required for `setBinaryStream()` in `PreparedStatements`.
- Retrieve `TX_ISOLATION` from database for `Connection.getTransactionIsolation()` when the MySQL version supports it, instead of an instance variable.
- Quote table names in `DatabaseMetaData.getColumns()`, `getPrimaryKeys()`, `getIndexInfo()`, `getBestRowIdentifier()`.
- Fixed `Buffer.fastSkipLenString()` causing `ArrayIndexOutOfBounds` exceptions with some queries when unpacking fields.

- Added update options for foreign key metadata.
- Implemented an empty `TypeMap` for `Connection.getTypeMap()` so that some third-party apps work with MySQL (IBM WebSphere 5.0 Connection pool).
- Added missing `LONGTEXT` type to `DBMD.getColumns()`.
- Fixed `ResultSet.isBeforeFirst()` for empty result sets.

D.5.4.14. Changes in MySQL Connector/J 3.0.4 (06 January 2003)

Bugs Fixed

- Added support for quoted identifiers in `PreparedStatement` parser.
- Added `strictUpdates` property to enable control of amount of checking for "correctness" of updatable result sets. Set this to `false` if you want faster updatable result sets and you know that you create them from `SELECT` statements on tables with primary keys and that you have selected all primary keys in your query.
- Reduce memory footprint of `PreparedStatements` by sharing outbound packet with `MysqlIO`.
- Added support for 4.0.8-style large packets.
- Added quoted identifiers to database names for `Connection.setCatalog`.
- Fixed `PreparedStatement.executeBatch()` parameter overwriting.
- Streamlined character conversion and `byte[]` handling in `PreparedStatements` for `setByte()`.

D.5.4.15. Changes in MySQL Connector/J 3.0.3 (17 December 2002)

Bugs Fixed

- Changed `SingleByteCharConverter` to use lazy initialization of each converter.
- Fixed `ResultSetMetaData.getPrecision()` returning incorrect values for some floating-point types.
- Check for connection closed in more `Connection` methods (`createStatement`, `prepareStatement`, `setTransactionIsolation`, `setAutoCommit`).
- Some MySQL-4.1 protocol support (extended field info from selects).
- More robust implementation of updatable result sets. Checks that *all* primary keys of the table have been selected.
- `DBMD.getImported/ExportedKeys()` now handles multiple foreign keys per table.
- Honor `lower_case_table_names` when enabled in the server when doing table name comparisons in `DatabaseMetaData` methods.
- Added `CLIENT_LONG_FLAG` to be able to get more column flags (`isAutoIncrement()` being the most important).
- Substitute `'?'` for unknown character conversions in single-byte character sets instead of `'\0'`.
- Because of above, implemented `ResultSetMetaData.isAutoIncrement()` to use `Field.isAutoIncrement()`.
- Fixed charset handling in `Fields.java`.
- Fixed `ResultSetMetaData.getColumnTypeName()` returning `BLOB` for `TEXT` and `TEXT` for `BLOB` types.
- Implemented `Connection.nativeSQL()`.
- `LOAD DATA LOCAL INFILE ...` now works, if your server is configured to permit it. Can be turned off with the `allowLoadLocalInfile` property (see the `README`).
- Use nonaliased table/column names and database names to fully qualify tables and columns in `UpdatableResultSet` (requires MySQL-4.1 or newer).

- Changed `charsToByte` in `SingleByteCharConverter` to be nonstatic.
- `NamedPipeSocketFactory` now works (only intended for Windows), see `README` for instructions.
- Fixed `Buffer.isLastDataPacket()` for 4.1 and newer servers.
- More robust escape tokenizer: Recognize `--` comments, and permit nested escape sequences (see `testsuite.EscapeProcessingTest`).
- Allow user to alter behavior of `Statement`/`PreparedStatement.executeBatch()` using `continueBatchOnError` property (defaults to `true`).

D.5.4.16. Changes in MySQL Connector/J 3.0.2 (08 November 2002)

Bugs Fixed

- Implemented `Clob.truncate()`.
- Properly restore connection properties when autoReconnecting or failing-over, including `autoCommit` state, and isolation level.
- Fixed issue when calling `Statement.setFetchSize()` when using arbitrary values.
- Added `queriesBeforeRetryMaster` property that specifies how many queries to issue when failed over before attempting to reconnect to the master (defaults to 50).
- Fixed `ResultSet.setFetchDirection(FETCH_UNKNOWN)`.
- Added driver property `useHostsInPrivileges`. Defaults to `true`. Affects whether or not `@hostname` will be used in `DBMD.getColumn/TablePrivileges`.
- Fixed `ResultSet.isLast()` for empty result sets (should return `false`).
- Fixed various non-ASCII character encoding issues.
- Added `connectTimeout` parameter that enables users of JDK-1.4 and newer to specify a maximum time to wait to establish a connection.
- Fixed start position off-by-1 error in `Clob.getSubString()`.
- Fixed issue with updatable result sets and `PreparedStatements` not working.
- `PreparedStatement` now honors stream lengths in setBinary/Ascii/Character Stream() unless you set the connection property `useStreamLengthsInPrepStmts` to `false`.
- Escape `0x5c` character in strings for the SJIS charset.
- Removed some not-needed temporary object creation by smarter use of `Strings` in `EscapeProcessor`, `Connection` and `DatabaseMetaData` classes.
- Implemented `ResultSet.updateBlob()`.
- Fixed incorrect conversion in `ResultSet.getLong()`.
- Fixed `UnsupportedEncodingException` thrown when “forcing” a character encoding using properties.
- Removed duplicate code from `UpdatableResultSet` (it can be inherited from `ResultSet`, the extra code for each method to handle updatability I thought might someday be necessary has not been needed).
- Implemented `Clob.setAsciiStream()`.
- Fixed `DBMD.supportsResultSetConcurrency()` so that it returns `true` for `ResultSet.TYPE_SCROLL_INSENSITIVE` and `ResultSet.CONCUR_READ_ONLY` or `ResultSet.CONCUR_UPDATABLE`.
- Failover and `autoReconnect` work only when the connection is in an `autoCommit(false)` state, to stay transaction-safe.
- Implemented `Clob.setCharacterStream()`.

- Use `SHOW CREATE TABLE` when possible for determining foreign key information for `DatabaseMetaData`. Also enables cascade options for `DELETE` information to be returned.
- All `DBMD` result set columns describing schemas now return `NULL` to be more compliant with the behavior of other JDBC drivers for other database systems (MySQL does not support schemas).
- Added SSL support. See `README` for information on how to use it.
- Added `com.mysql.jdbc.MiniAdmin` class, which enables you to send `shutdown` command to MySQL server. This is intended to be used when "embedding" Java and MySQL server together in an end-user application.
- Implemented `Clob.setString()`.

D.5.4.17. Changes in MySQL Connector/J 3.0.1 (21 September 2002)

Bugs Fixed

- Added `paranoid` parameter, which sanitizes error messages by removing "sensitive" information from them (such as host names, ports, or user names), as well as clearing "sensitive" data structures when possible.
- Added `LOCAL TEMPORARY` to table types in `DatabaseMetaData.getTableTypes()`.
- Added `socketTimeout` parameter to URL.
- `Connection.close()` issues `rollback()` when `getAutoCommit()` is `false`.
- `Connection.isClosed()` no longer "pings" the server.
- Added limited `Clob` functionality (`ResultSet.getClob()`, `PreparedStatement.setClob()`, `PreparedStatement.setObject(Clob)`.
- Implemented `ResultSet.getCharacterStream()`.
- Massive code clean-up to follow Java coding conventions (the time had come).
- Fixed `ResultSet.getRow()` off-by-one bug.
- Fixed `RowDataStatic.getAt()` off-by-one bug.
- Fixed `ResultSetMetaData.isSigned()` for `TINYINT` and `BIGINT`.
- Charsets now automatically detected. Optimized code for single-byte character set conversion.

D.5.4.18. Changes in MySQL Connector/J 3.0.0 (31 July 2002)

Bugs Fixed

- Performance enhancements: Driver is now 50–100% faster in most situations, and creates fewer temporary objects.
- **!!! LICENSE CHANGE !!!** The driver is now GPL. If you need non-GPL licenses, please contact me `<mark@mysql.com>`.
- Overall speed improvements using controlling transient object creation in `MysqlIO` class when reading packets.
- JDBC-3.0 functionality including `Statement/PreparedStatement.getGeneratedKeys()` and `ResultSet.getURL()`.
- Performance improvements in string handling and field metadata creation (lazily instantiated) contributed by Alex Twisleton-Wykeham-Fiennes.
- Better checking for closed connections in `Statement` and `PreparedStatement`.
- Support for large packets (new addition to MySQL-4.0 protocol), see `README` for more information.
- Repackaging: New driver name is `com.mysql.jdbc.Driver`, old name still works, though (the driver is now provided by MySQL-AB).
- Added multi-host failover support (see `README`).

- `ResultSet.getDate/Time/Timestamp` now recognizes all forms of invalid values that have been set to all zeros by MySQL (SF bug 586058).
- JDBC Compliance: Passes all tests besides stored procedure tests.
- Testsuite now uses Junit (which you can get from http://www.junit.org.
- Support for streaming (row-by-row) result sets (see `README`) Thanks to Doron.
- Float types now reported as `java.sql.Types.FLOAT` (SF bug 579573).
- `ResultSet.getTimestamp()` now works for `DATE` types (SF bug 559134).
- Fix and sort primary key names in `DBMetaData` (SF bugs 582086 and 582086).
- The driver now only works with JDK-1.2 or newer.
- General source-code cleanup.

D.5.5. Changes in MySQL Connector/J 2.0.x

D.5.5.1. Changes in MySQL Connector/J 2.0.14 (16 May 2002)

Bugs Fixed

- Quoted identifiers not used if server version does not support them. Also, if server started with `--ansi` or `--sql-mode=ANSI_QUOTES`, "`"`" will be used as an identifier quote character, otherwise "`'`" will be used.
- More code cleanup.
- `PreparedStatement` now releases resources on `.close()`. (SF bug 553268)
- Added SQL profiling (to `STDERR`). Set `profileSql=true` in your JDBC URL. See `README` for more information.
- `LogicalHandle.isClosed()` calls through to physical connection.
- Fixed typo for `relaxAutoCommit` parameter.
- `ResultSet.getDouble()` now uses code built into JDK to be more precise (but slower).

D.5.5.2. Changes in MySQL Connector/J 2.0.13 (24 April 2002)

Bugs Fixed

- `ResultSetMetaData.getColumnClassName()` now implemented.
- `DBMetaData.getIndexInfo()` - bad PAGES fixed. (SF BUG 542201)
- Rudimentary version of `Statement.getGeneratedKeys()` from JDBC-3.0 now implemented (you need to be using JDK-1.4 for this to work, I believe).
- More code cleanup.
- `PreparedStatement.toString()` fixed. (SF bug 534026)
- Added `set/getPortNumber()` to `DataSource(s)`. (SF bug 548167)
- Added `setURL()` to `MySQLXADataSource`. (SF bug 546019)
- Faster blob escaping for `PrepStmt`.
- Fixed unicode chars being read incorrectly. (SF bug 541088)

D.5.5.3. Changes in MySQL Connector/J 2.0.12 (07 April 2002)

Bugs Fixed

- General code cleanup.
- Fixed `getRow()` bug (527165) in `ResultSet`.
- `ResultSet.refreshRow()` implemented.
- Added `getIdleFor()` method to `Connection` and `MysqlLogicalHandle`.
- Added `getTable/ColumnPrivileges()` to DBMD (fixes 484502).
- `ResultSet`: Fixed updatability (values being set to `null` if not updated).
- Fixes for `ResultSet` updatability in `PreparedStatement`.
- Added support for `YEAR` type (533556).
- `DataSources` - fixed `setUrl` bug (511614, 525565), wrong datasource class name (532816, 528767).
- Relaxed synchronization in all classes, should fix 520615 and 520393.
- `ResultSet.insertRow()` should now detect auto_increment fields in most cases and use that value in the new row. This detection will not work in multi-valued keys, however, due to the fact that the MySQL protocol does not return this information.
- Added support for `BIT` types (51870) to `PreparedStatement`.
- Added identifier quoting to all `DatabaseMetaData` methods that need them (should fix 518108).
- Fixed time zone off-by-1-hour bug in `PreparedStatement` (538286, 528785).
- Added new types to `getTypeInfo()`, fixed existing types thanks to Al Davis and Kid Kalanon.
- Fixed `testsuite.Traversal` `afterLast()` bug, thanks to Igor Lastric.

D.5.5.4. Changes in MySQL Connector/J 2.0.11 (27 January 2002)

Bugs Fixed

- More changes to fix `Unexpected end of input stream` errors when reading `BLOB` values. This should be the last fix.
- Fixed missing `DELETE_RULE` value in `DBMD.getImported/ExportedKeys()` and `getCrossReference()`.
- Full synchronization of `Statement.java`.

D.5.5.5. Changes in MySQL Connector/J 2.0.10 (24 January 2002)

Bugs Fixed

- Fixed spurious `Unexpected end of input stream` errors in `MysqlIO` (bug 507456).
- Fixed null-pointer-exceptions when using `MysqlConnectionPoolDataSource` with Websphere 4 (bug 505839).

D.5.5.6. Changes in MySQL Connector/J 2.0.9 (13 January 2002)

Bugs Fixed

- Full synchronization on methods modifying instance and class-shared references, driver should be entirely thread-safe now (please let me know if you have problems).
- Fixed off-by-one-hour error in `PreparedStatement.setTimestamp()` (bug 491577).
- Implementation of `DatabaseMetaData.getExported/ImportedKeys()` and `getCrossReference()`.
- Report batch update support through `DatabaseMetaData` (bug 495101).

- `Ant` build was corrupting included `jar` files, fixed (bug 487669).
- Removed concatenation support from driver (the `||` operator), as older versions of VisualAge seem to be the only thing that use it, and it conflicts with the logical `||` operator. You will need to start `mysqld` with the `--ansi` flag to use the `||` operator as concatenation (bug 491680).
- Fixed quoting error with escape processor (bug 486265).
- `DataSource` implementations moved to `org.gjt.mm.mysql.jdbc2.optional` package, and (initial) implementations of `PooledConnectionDataSource` and `XADataSource` are in place (thanks to Todd Wolff for the implementation and testing of `PooledConnectionDataSource` with IBM WebSphere 4).
- Fixed casting bug in `PreparedStatement` (bug 488663).
- Added detection of network connection being closed when reading packets (thanks to Todd Lizambri).
- Fixed extra memory allocation in `MysqlIO.readPacket()` (bug 488663).

D.5.5.7. Changes in MySQL Connector/J 2.0.8 (25 November 2001)

Bugs Fixed

- `PreparedStatement.setAnyNumericType()` now handles positive exponents correctly (adds `+` so MySQL can understand it).
- Batch updates now supported (thanks to some inspiration from Daniel Rall).
- `DatabaseMetaData.getPrimaryKeys()` and `getBestRowIdentifier()` are now more robust in identifying primary keys (matches regardless of case or abbreviation/full spelling of `Primary Key` in `Key_type` column).
- `XADataSource`/`ConnectionPoolDataSource` code (experimental)

D.5.5.8. Changes in MySQL Connector/J 2.0.7 (24 October 2001)

Bugs Fixed

- Fixed `ResultSet.isAfterLast()` always returning `false`.
- PreparedStatement.setBoolean() will use 1/0 for values if your MySQL version is 3.21.23 or higher.
- Updatable result sets now correctly handle `NULL` values in fields.
- Fixed `DatabaseMetaData.supportsTransactions()`, and `supportsTransactionIsolationLevel()` and `getTypeInfo()` `SQL_DATETIME_SUB` and `SQL_DATA_TYPE` fields not being readable.
- PreparedStatement.setDouble() now uses full-precision doubles (reverting a fix made earlier to truncate them).
- Fixed time zone issue in `PreparedStatement.setTimestamp()`. (thanks to Erik Olofsson)
- Fixed dangling socket problem when in high availability (`autoReconnect=true`) mode, and finalizer for `Connection` will close any dangling sockets on GC.
- Fixed `ResultSetMetaData.getPrecision()` returning one less than actual on newer versions of MySQL.
- `ResultSet.getBlob()` now returns `null` if column value was `null`.
- Capitalize type names when `capitalizeTypeNames=true` is passed in URL or properties (for WebObjects. (thanks to Anjo Krank)
- `PreparedStatement.setCharacterStream()` now implemented
- Fixed `PreparedStatement` generating SQL that would end up with syntax errors for some queries.
- Initial transaction isolation level read from database (if available). (thanks to Dmitry Vereshchagin)
- Character sets read from database if `useUnicode=true` and `characterEncoding` is not set. (thanks to Dmitry Vereshchagin)

D.5.5.9. Changes in MySQL Connector/J 2.0.6 (16 June 2001)

Bugs Fixed

- Fixed case-sensitive column names in `ResultSet.java`.
- Fixed `PreparedStatement` parameter checking.

D.5.5.10. Changes in MySQL Connector/J 2.0.5 (13 June 2001)

Bugs Fixed

- Fixed `ResultSet.getBlob()` `ArrayIndex` out-of-bounds.
- Fixed NPE on `PreparedStatement.executeUpdate()` when all columns have not been set.
- Fixed `ArrayIndexOutOfBounds` when sending large `BLOB` queries. (Max size packet was not being set)
- Fixed `ResultSetMetaData.getColumnTypeName` for `TEXT`/`BLOB`.
- `getObject()` on `ResultSet` correctly does `TINYINT`->`Byte` and `SMALLINT`->`Short`.
- `ResultSet` has +/-Inf/inf support.
- `ResultSet.getBoolean()` now recognizes `-1` as `true`.
- `DataBaseMetaData.getCrossReference()` no longer `ArrayIndexOOB`.
- Added `ISOLATION` level support to `Connection.setIsolationLevel()`
- Fixed data parsing of `TIMESTAMP` values with 2-digit years.
- Added `Byte` to `PreparedStatement.setObject()`.
- `ResultSet.insertRow()` works now, even if not all columns are set (they will be set to `NULL`).

D.5.5.11. Changes in MySQL Connector/J 2.0.3 (03 December 2000)

Bugs Fixed

- Implemented `getBigDecimal()` without scale component for JDBC2.
- Added `ultraDevHack` URL parameter, set to `true` to enable (broken) Macromedia UltraDev to use the driver.
- Added detection of -/+INF for doubles.
- Fixed incorrect detection of `MAX_ALLOWED_PACKET`, so sending large blobs should work now.
- Fixed off-by-one error in `java.sql.Blob` implementation code.
- Faster ASCII string operations.
- Fixed composite key problem with updatable result sets.

D.5.5.12. Changes in MySQL Connector/J 2.0.1 (06 April 2000)

Bugs Fixed

- Fixed some issues with updatability support in `ResultSet` when using multiple primary keys.
- No escape processing is done on `PreparedStatements` anymore per JDBC spec.
- Fixed many JDBC-2.0 traversal, positioning bugs, especially with respect to empty result sets. Thanks to Ron Smits, Nick Brook, Cessar Garcia and Carlos Martinez.

- `DatabaseMetaData.getPrimaryKeys()` now works correctly with respect to `key_seq`. Thanks to Brian Slesinsky.
- Fixed `RSMD.isWritable()` returning wrong value. Thanks to Moritz Maass.
- Cleaned up exception handling when driver connects.
- Columns that are of type `TEXT` now return as `Strings` when you use `getObject()`.

D.5.5.13. Changes in MySQL Connector/J 2.0.0pre5 (21 February 2000)

- Fixed Bad Handshake problem.

D.5.5.14. Changes in MySQL Connector/J 2.0.0pre4 (10 January 2000)

- Fixes to ResultSet for insertRow() - Thanks to Cesar Garcia
- Fix to Driver to recognize JDBC-2.0 by loading a JDBC-2.0 class, instead of relying on JDK version numbers. Thanks to John Baker.
- Fixed ResultSet to return correct row numbers
- Statement.getUpdateCount() now returns rows matched, instead of rows actually updated, which is more SQL-92 like.

10-29-99

- Statement/PreparedStatement.getMoreResults() bug fixed. Thanks to Noel J. Bergman.
- Added Short as a type to PreparedStatement.setObject(). Thanks to Jeff Crowder
- Driver now automagically configures maximum/preferred packet sizes by querying server.
- Autoreconnect code uses fast ping command if server supports it.
- Fixed various bugs with respect to packet sizing when reading from the server and when alloc'ing to write to the server.

D.5.5.15. Changes in MySQL Connector/J 2.0.0pre (17 August 1999)

- Now compiles under JDK-1.2. The driver supports both JDK-1.1 and JDK-1.2 at the same time through a core set of classes. The driver will load the appropriate interface classes at runtime by figuring out which JVM version you are using.
- Fixes for result sets with all nulls in the first row. (Pointed out by Tim Endres)
- Fixes to column numbers in SQLExceptions in ResultSet (Thanks to Blas Rodriguez Somoza)
- The database no longer needs to specified to connect. (Thanks to Christian Motschke)

D.5.6. Changes in MySQL Connector/J 1.2.x and lower

D.5.6.1. Changes in MySQL Connector/J 1.2b (04 July 1999)

- Better Documentation (in progress), in doc/mm.doc/book1.html
- DBMD now permits null for a column name pattern (not in spec), which it changes to '%'.
- DBMD now has correct types/lengths for getXXX().
- ResultSet.getDate(), getTime(), and getTimestamp() fixes. (contributed by Alan Wilken)
- EscapeProcessor now handles \{ \} and { or } inside quotation marks correctly. (thanks to Alik for some ideas on how to fix it)

- Fixes to properties handling in Connection. (contributed by Juho Tikkala)
- ResultSet.getObject() now returns null for NULL columns in the table, rather than bombing out. (thanks to Ben Grosman)
- ResultSet.getObject() now returns Strings for types from MySQL that it doesn't know about. (Suggested by Chris Perdue)
- Removed DataInput/Output streams, not needed, 1/2 number of method calls per IO operation.
- Use default character encoding if one is not specified. This is a work-around for broken JVMs, because according to spec, EVERY JVM must support "ISO8859_1", but they do not.
- Fixed Connection to use the platform character encoding instead of "ISO8859_1" if one isn't explicitly set. This fixes problems people were having loading the character- converter classes that didn't always exist (JVM bug). (thanks to Fritz Elfert for pointing out this problem)
- Changed MysqlIO to re-use packets where possible to reduce memory usage.
- Fixed escape-processor bugs pertaining to {} inside quotation marks.

D.5.6.2. Changes in MySQL Connector/J 1.2a (14 April 1999)

- Fixed character-set support for non-Javasoft JVMs (thanks to many people for pointing it out)
- Fixed ResultSet.getBoolean() to recognize 'y' & 'n' as well as '1' & '0' as boolean flags. (thanks to Tim Pizey)
- Fixed ResultSet.getTimestamp() to give better performance. (thanks to Richard Swift)
- Fixed getByte() for numeric types. (thanks to Ray Bellis)
- Fixed DatabaseMetaData.getTypeInfo() for DATE type. (thanks to Paul Johnston)
- Fixed EscapeProcessor for "fn" calls. (thanks to Piyush Shah at locomotive.org)
- Fixed EscapeProcessor to not do extraneous work if there are no escape codes. (thanks to Ryan Gustafson)
- Fixed Driver to parse URLs of the form "jdbc:mysql://host:port" (thanks to Richard Lobb)

D.5.6.3. Changes in MySQL Connector/J 1.1i (24 March 1999)

- Fixed Timestamps for PreparedStatements
- Fixed null pointer exceptions in RSMD and RS
- Re-compiled with jikes for valid class files (thanks ms!)

D.5.6.4. Changes in MySQL Connector/J 1.1h (08 March 1999)

- Fixed escape processor to deal with unmatched { and } (thanks to Craig Coles)
- Fixed escape processor to create more portable (between DATETIME and TIMESTAMP types) representations so that it will work with BETWEEN clauses. (thanks to Craig Longman)
- MysqlIO.quit() now closes the socket connection. Before, after many failed connections some OS's would run out of file descriptors. (thanks to Michael Brinkman)
- Fixed NullPointerException in Driver.getPropertyInfo. (thanks to Dave Potts)
- Fixes to MysqlDefs to allow all *text fields to be retrieved as Strings. (thanks to Chris at Leverage)
- Fixed setDouble in PreparedStatement for large numbers to avoid sending scientific notation to the database. (thanks to J.S. Ferguson)
- Fixed getScale() and getPrecision() in RSMD. (contrib'd by James Klicman)
- Fixed getObject() when field was DECIMAL or NUMERIC (thanks to Bert Hobbs)

- DBMD.getTables() bombed when passed a null table-name pattern. Fixed. (thanks to Richard Lobb)
- Added check for "client not authorized" errors during connect. (thanks to Hannes Wallnoefer)

D.5.6.5. Changes in MySQL Connector/J 1.1g (19 February 1999)

- Result set rows are now byte arrays. Blobs and Unicode work bidirectonally now. The useUnicode and encoding options are implemented now.
- Fixes to PreparedStatement to send binary set by setXXXStream to be sent untouched to the MySQL server.
- Fixes to getDriverPropertyInfo().

D.5.6.6. Changes in MySQL Connector/J 1.1f (31 December 1998)

- Changed all ResultSet fields to Strings, this should allow Unicode to work, but your JVM must be able to convert between the character sets. This should also make reading data from the server be a bit quicker, because there is now no conversion from StringBuffer to String.
- Changed PreparedStatement.streamToString() to be more efficient (code from Uwe Schaefer).
- URL parsing is more robust (throws SQL exceptions on errors rather than NullPointerExceptions)
- PreparedStatement now can convert Strings to Time/Date values using setObject() (code from Robert Currey).
- IO no longer hangs in Buffer.readInt(), that bug was introduced in 1.1d when changing to all byte-arrays for result sets. (Pointed out by Samo Login)

D.5.6.7. Changes in MySQL Connector/J 1.1b (03 November 1998)

- Fixes to DatabaseMetaData to allow both IBM VA and J-Builder to work. Let me know how it goes. (thanks to Jac Kersing)
- Fix to ResultSet.getBoolean() for NULL strings (thanks to Barry Lagerweij)
- Beginning of code cleanup, and formatting. Getting ready to branch this off to a parallel JDBC-2.0 source tree.
- Added "final" modifier to critical sections in MysqlIO and Buffer to allow compiler to inline methods for speed.

9-29-98

- If object references passed to setXXX() in PreparedStatement are null, setNull() is automatically called for you. (Thanks for the suggestion goes to Erik Ostrom)
- setObject() in PreparedStatement will now attempt to write a serialized representation of the object to the database for objects of Types.OTHER and objects of unknown type.
- Util now has a static method readObject() which given a ResultSet and a column index will re-instantiate an object serialized in the above manner.

D.5.6.8. Changes in MySQL Connector/J 1.1 (02 September 1998)

- Got rid of "ugly hack" in MysqlIO.nextRow(). Rather than catch an exception, Buffer.isLastDataPacket() was fixed.
- Connection.getCatalog() and Connection.setCatalog() should work now.
- Statement.setMaxRows() works, as well as setting by property maxRows. Statement.setMaxRows() overrides maxRows set using properties or url parameters.
- Automatic re-connection is available. Because it has to "ping" the database before each query, it is turned off by default. To use it, pass in "autoReconnect=true" in the connection URL. You may also change the number of reconnect tries, and the initial timeout value using "maxReconnects=n" (default 3) and "initialTimeout=n" (seconds, default 2) parameters. The timeout is an

exponential backoff type of timeout; for example, if you have initial timeout of 2 seconds, and maxReconnects of 3, then the driver will timeout 2 seconds, 4 seconds, then 16 seconds between each re-connection attempt.

D.5.6.9. Changes in MySQL Connector/J 1.0 (24 August 1998)

- Fixed handling of blob data in Buffer.java
- Fixed bug with authentication packet being sized too small.
- The JDBC Driver is now under the LGPL

8-14-98

- Fixed Buffer.readLenString() to correctly read data for BLOBS.
- Fixed PreparedStatement.stringToStream to correctly read data for BLOBS.
- Fixed PreparedStatement.setDate() to not add a day. (above fixes thanks to Vincent Partington)
- Added URL parameter parsing (?user=... and so forth).

D.5.6.10. Changes in MySQL Connector/J 0.9d (04 August 1998)

- Big news! New package name. Tim Endres from ICE Engineering is starting a new source tree for GNU GPL'd Java software. He's graciously given me the org.gjt.mm package directory to use, so now the driver is in the org.gjt.mm.mysql package scheme. I'm "legal" now. Look for more information on Tim's project soon.
- Now using dynamically sized packets to reduce memory usage when sending commands to the DB.
- Small fixes to getTypeInfo() for parameters, and so forth.
- DatabaseMetaData is now fully implemented. Let me know if these drivers work with the various IDEs out there. I've heard that they're working with JBuilder right now.
- Added JavaDoc documentation to the package.
- Package now available in .zip or .tar.gz.

D.5.6.11. Changes in MySQL Connector/J 0.9 (28 July 1998)

- Implemented getTypeInfo(). Connection.rollback() now throws an SQLException per the JDBC spec.
- Added PreparedStatement that supports all JDBC API methods for PreparedStatement including InputStreams. Please check this out and let me know if anything is broken.
- Fixed a bug in ResultSet that would break some queries that only returned 1 row.
- Fixed bugs in DatabaseMetaData.getTables(), DatabaseMetaData.getColumns() and DatabaseMetaData.getCatalogs().
- Added functionality to Statement that enables executeUpdate() to store values for IDs that are automatically generated for AUTO_INCREMENT fields. Basically, after an executeUpdate(), look at the SQLWarnings for warnings like "LAST_INSERTED_ID = 'some number', COMMAND = 'your SQL query'". If you are using AUTO_INCREMENT fields in your tables and are executing a lot of executeUpdate()s on one Statement, be sure to clearWarnings() every so often to save memory.

D.5.6.12. Changes in MySQL Connector/J 0.8 (06 July 1998)

- Split MysqlIO and Buffer to separate classes. Some ClassLoaders gave an IllegalAccess error for some fields in those two classes. Now mm.mysql works in applets and all classloaders. Thanks to Joe Ennis <jce@mail.boone.com> for pointing out the problem and working on a fix with me.

D.5.6.13. Changes in MySQL Connector/J 0.7 (01 July 1998)

- Fixed DatabaseMetadata problems in getColumns() and bug in switch statement in the Field constructor. Thanks to Costin Manolache <costin@tdiinc.com> for pointing these out.

D.5.6.14. Changes in MySQL Connector/J 0.6 (21 May 1998)

- Incorporated efficiency changes from Richard Swift <Richard.Swift@kanatek.ca> in `MysqlIO.java` and `ResultSet.java`:
- We're now 15% faster than gwe's driver.
- Started working on `DatabaseMetaData`.
- The following methods are implemented:
  - `getTables()`
  - `getTableTypes()`
  - `getColumns()`
  - `getCatalogs()`

D.6. MySQL Connector/MXJ Change History

D.6.1. Changes in MySQL Connector/MXJ 5.0.12 (07 July 2011)

Functionality Added or Changed

- **Incompatible Change**: Connector/MXJ now contains MySQL 5.5.9, not MySQL 5.1.
- These platform mappings were added:
  - Windows_Vista-amd64=Win-x86
  - Windows_2003-amd64=Win-x86
  - Windows_2000-amd64=Win-x86
  - FreeBSD-i386=FreeBSD-x86

D.6.2. Changes in MySQL Connector/MXJ 5.0.11 (24 November 2009)

Functionality Added or Changed

- The default timeout for the kill delay within the embedded test suite has been increased from 10 to 30 seconds.
- The embedded Aspect/J class has been removed.
- The contents of the directory used for bootstrapping the MySQL databases is now configurable by using the `windows-share-dir-jar` property. You should supply the name of a jar containing the files you want to use.
- The embedded MySQL binaries have been updated to MySQL 5.1.40 for GPL releases and MySQL 5.1.40 for Commercial releases.

Bugs Fixed

- On startup Connector/MXJ generated an exception on Windows 7:

```
Exception in thread “Thread-3” java.util.MissingResourceException?: Resource
```

```
'5-0-51a/Windows_7-x86/mysqld-nt.exe' not found
at com.mysql.management.util.Streams.getResourceAsStream(Streams.java:133)
at com.mysql.management.util.Streams.getResourceAsStream(Streams.java:107)
at com.mysql.management.util.Streams$1.inner(Streams.java:149) at
com.mysql.management.util.Exceptions$VoidBlock?.exec(Exceptions.java:128)
at com.mysql.management.util.Streams.createFileFromResource(Streams.java:162)
at com.mysql.management.MysqldResource?.makeMysqld(MysqldResource?.java:533)
at com.mysql.management.MysqldResource?.deployFiles(MysqldResource?.java:518)
at com.mysql.management.MysqldResource?.exec(MysqldResource?.java:495)
at com.mysql.management.MysqldResource?.start(MysqldResource?.java:216)
at com.mysql.management.MysqldResource?.start(MysqldResource?.java:166)
```

The default `platform-map.properties` file, which maps platforms to the supplied binary bundles, has been updated with additional platforms, including Windows 7, Windows Server 2008, `amd64` and `sparcv9` for Solaris, and Mac OS X 64-bit. (Bug #48298)

D.6.3. Changes in MySQL Connector/MXJ 5.0.10 (Not released)

This was an internal only release.

Functionality Added or Changed

- The MySQL binary for Windows targets has been updated to be configurable through the `windows-mysqld-command` property. This is to handle the move in MySQL 5.1.33 from `mysqld-nt.exe` to `mysqld.exe`. The default value is `mysqld.exe`.
- The embedded MySQL has been updated to the MySQL 5.1 series. The embedded MySQL binaries have been updated to MySQL 5.1.33 for GPL releases and MySQL 5.1.34 for Commercial releases.

D.6.4. Changes in MySQL Connector/MXJ 5.0.9 (19 August 2008)

Functionality Added or Changed

- The timeout for kill operations in the embedded test suite has been set to a default of 10 seconds.
- The embedded MySQL binaries have been updated to MySQL 5.0.51a for GPL releases and MySQL 5.0.54 for Commercial releases.
- The utility used to kill MySQL on Windows (`kill.exe`) has been configured to be loaded from the `kill.exe` property, instead of being hard-coded. The corresponding timeout, `KILL_DELAY` has also been moved to the properties file and defaults to 5 minutes.
- The port used in the `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExample` port is no longer hard coded. Instead, the code uses the `x-mxj_test_port` property a default value of `3336`

D.6.5. Changes in MySQL Connector/MXJ 5.0.8 (06 August 2007)

Functionality Added or Changed

- The embedded MySQL binaries have been updated to MySQL 5.0.45 for GPL releases and MySQL 5.0.46 for Commercial releases.
- The embedded documentation has been updated so that it now points to the main MySQL documentation pages in the MySQL reference manual.

D.6.6. Changes in MySQL Connector/MXJ 5.0.7 (27 May 2007)

Functionality Added or Changed

- The embedded MySQL binaries have been updated to MySQL 5.0.41 for GPL releases and MySQL 5.0.42 for Commercial releases.
- The `PatchedStandardSocketFactory` class has been removed, because it fixed an issue in Connector/J that was correc-

ted in Connector/J 5.0.6.

- The `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExammple` have been updated to include an example of initializing the user/password and creating an initial database. The `InitializePasswordExample` example class has now been removed.
- Updated the jar file name to be consistent with the Connector/J jar file name. Files are now formatted as `mysql-connector-mxj-mxj-version`.

Bugs Fixed

- Added a null-check to deal with class loaders where `getClassLoader()` returns null.

D.6.7. Changes in MySQL Connector/MXJ 5.0.6 (04 May 2007)

Functionality Added or Changed

- Removed references to `File.deleteOnExit`, a warning is printed instead.
- Fixed where `versionString.trim()` was ignored.
- `portFile` now contains a new-line to be consistent with `pidFile`.
- Errors reading `portFile` are now reported using `stacktrace(err)`, previously `System.err` was used.
- Added `main(String[])` to `com/mysql/management/AllTestsSuite.java`.
- Removed obsolete `PatchedStandardSocketFactory` java file.
- Clarified code in `DefaultsMap.entrySet()`.
- Removed obsolete field `SimpleMysqldDynamicMBean.lastInvocation`.
- Added new connection property `initialize-user` which, if set to `true` will remove the default, un-passworded anonymous and root users, and create the user/password from the connection url.
- `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExample` now demonstrate the initialization of user/password and creating the initial database (rather than using "test").
- Added new tests for initial-user & expanded some existing tests.
- Added `InitializeUser` and `QueryUtil` classes to support new feature.
- Added copyright notices to some classes which were missing them.
- Updated commercial license files.
- Updated internal jar file names to include version information and be more consistent with Connector/J jar naming. For example, `connector-mxj.jar` is now `mysql-connector-mxj-${mxj-version}.jar`.

Bugs Fixed

- Removed obsolete `InitializePasswordExample`
- Refactored duplication from tests and examples to `QueryUtil`.
- Removed `PatchedStandardSocketFactory` (fixed in Connector/J 5.0.6).
- Added robustness around reading portfile.
- Added null-check to deal with C/MXJ being loaded by the bootstrap classloaders with JVMs for which `getClassLoader()` returns null.
- Removed `use-default-architecture` property replaced.
- Updated `build.xml` in preparation for next beta build.

- Clarified the startup max wait numbers.
- Moved `platform-map.properties` into `db-files.jar`.
- Delete `portFile` on shutdown.
- Swapped out commercial binaries for v5.0.40.
- Added os.name-os.arch to resource directory mapping properties file.
- Fixed port file to always be written to datadir.
- Changed tests to shutdown mysqld prior to deleting files.

D.6.8. Changes in MySQL Connector/MXJ 5.0.5 (14 March 2007)

Bugs Fixed

- Removed 5.0.22 binaries from the repository.
- Swapped out gpl binaries for v5.0.37.
- Ensured 5.1.14 compatibility.
- Added Patched `StandardSocketFactory` from Connector/J 5-0 HEAD.
- Replaced windows `kill.exe` resource with re-written version specific to mysqld.
- Added 5.1.14 binaries to repository.
- Added `getDataDir()` to interface `MysqldResourceI`.
- Removed 5.1.14 binaries from the repository.
- Added 5.1.15 binaries to the repository.
- Clarified the immutability of `baseDir`, `dataDir`, `pidFile`, `portFile`.
- `SIGHUP` is replaced with `MySQLShutdown<PID>` event.
- Clarified the synchronization of `MysqldResource` methods.
- Changed `SimpleMysqldDynamicMBean` to create `MysqldResource` on demand to enable setting of `datadir`. (Rubinger bug groundwork).
- Updated `build.xml` in prep for next release.
- Added testcase to `com.mysql.management.jmx.AcceptanceTest` which demonstrates that `dataDir` is a mutable MBean property.
- In testing so far mysqld reliably shuts down cleanly much faster.
- Changed `connector-mxj.properties` default mysql version to 5.0.37.
- Replaced `Boolean.parseBoolean` with JDK 1.4 compliant `valueOf`.
- New windows `kill.exe` fixes a bug where mysqld was being force terminated. Issue reported by bruno haleblian and others, see: MySQL Forums.
- Now incorporates Reggie Bernett's `SafeTerminateProcess` and only calls the unsafe TerminateProcess as a final last resort.
- `build.xml`: `usage` now slightly more verbose; some reformatting.
- Changed protected constructor of `SimpleMysqldDynamicMBean` from taking a `MysqldResource` to taking a `MysqldFactory`, to lay groundwork for addressing BUG discovered by Andrew Rubinger. See: MySQL Forums (Actual testing with JBoss, and filing a bug, is still required.)
- Found and removed dynamic linking in mysql_kill; updated solution.

- Swapped out commercial binaries for v5.0.36.
- Reformatting: Added newlines some files which did not end in them.
- Moved `MysqldFactory` to main package.

D.6.9. Changes in MySQL Connector/MXJ 5.0.4 (28 January 2007)

Bugs Fixed

- Allow multiple calls to start server from URL connection on non-3306 port. (Bug #24004)
- Fixed test to be tolerant of `/tmp` being a symlink to `/foo/tmp`.
- Moved default version string out of java class into a text editable properties file (`connector-mxj.properties`) in the resources directory.
- Minor test robustness improvements.
- Moved mysqld binary resourced into separate jar file NOTICE: `CLASSPATH` will now need to `connector-mxj-db-files.jar`.
- Swapped out commercial binaries for v5.0.32.
- Swapped out gpl binaries for v5.0.27.
- Introduced property for Linux & WinXX to default to 32bit versions.
- Only populate the options map from the help text if specifically requested or in the MBean case.
- Updated `build.xml` to build to handle with different gpl and commercial mysqld version numbers.

D.6.10. Changes in MySQL Connector/MXJ 5.0.3 (24 June 2006)

Bugs Fixed

- Swapped out the mysqld binaries for MySQL v5.0.22.
- Removed "TeeOutputStream" - no longer needed.
- Removed unused imports, formatted code, made minor edits to tests.

D.6.11. Changes in MySQL Connector/MXJ 5.0.2 (15 June 2006)

Bugs Fixed

- ServerLauncherSocketFactory.shutdown API change: now takes 2 File parameters (basedir, datadir)
- ServerLauncherSocketFactory now treats URL parameters in the form of `&server.foo=null` as `serverOptionMap.put("foo", null)`
- ServerLauncherSocketFactory.shutdown(port) no longer throws, only reports to System.err
- extracted splitLines(String) to Str utility class
- ServerLauncherSocketFactory.shutdown now works across JVMs.
- moved PID file into datadir
- MysqldResource now tied to dataDir as well as basedir (API CHANGE)
- swapped out the mysqld binaries for MySQL v5.0.19
- Extended timeout for help string parsing, to avoid cases where the help text was getting prematurely flushed, and thus trun-

cated.

- added ability to specify "mysql-version" as an url parameter
- socket is now "mysql.sock" in datadir
- ServerLauncherSocketFactory.shutdown API change: now takes File parameter (basedir) instead of port.
- Made tests more robust be deleting the /tmp/test-c.mxj directory before running tests.
- swapped out the mysqld binaries for MySQL v5.0.18
- insulated users from problems with "." in basedir
- help parsing test reflects current help options
- altered to be "basedir" rather than "port" oriented.
- reformatted code
- Added trace level logging with Aspect/J. `CLASSPATH` will now need to include `lib/aspectjrt.jar`
- Swapped out the mysqld binaries for MySQL v5.0.21
- extracted array and list printing to ListToString utility class
- "platform" directories replace spaces with underscores
- Replaced string parsing with JDBC connection attempt for determining if a mysqld is "ready for connections" `CLASSPATH` will now need to include Connector/J jar.

D.6.12. Changes in MySQL Connector/MXJ 5.0.1 (Not released)

This was an internal only release.

Version 5.0.1 has no changelog entries.

D.6.13. Changes in MySQL Connector/MXJ 5.0.0 (09 December 2005)

Bugs Fixed

- Minor refactorings for type casting and exception handling.
- Ditched "ClassUtil" (merged with Str).
- Swapped out the mysqld binaries for MySQL v5.0.16.
- Altered examples and tests to use new Connector/J 5.0 URL syntax for launching Connector/MXJ ("jdbc:mysql:mxj://")
- Minor test tweaks
- Reorganized utils into a single "Utils" collaborator.
- Removed HelpOptionsParser's need to reference a MysqldResource.

D.7. MySQL Connector/C++ Change History

D.7.1. Changes in MySQL Connector/C++ 1.1.x

D.7.1.1. Changes in MySQL Connector/CPP 1.1.0 (13 September 2010, Generally Available)

This fixes bugs since the first GA release 1.0.5 and introduces new features.

Functionality Added or Changed

- **Incompatible Change**: API incompatible change: `ConnectPropertyVal` is no longer a `struct` by a typedef that uses `boost::variant`. Code such as:

```
sql::ConnectPropertyVal tmp;
tmp.str.val=passwd.c_str();
tmp.str.len=passwd.length();
connection_properties["password"] = tmp;
```

  Should be changed to:

```
connection_properties["password"] = sql::ConnectPropertyVal(passwd);
```

- `Connection::getClientOption(const sql::SQLString & optionName, void * optionValue)` now accepts the `optionName` values `metadataUseInfoSchema`, `defaultStatementResultType`, `defaultPreparedStatementResultType`, and `characterSetResults`. In the previous version only `metadataUseInfoSchema` was permitted. The same options are available for `Connection::setClientOption()`.
- `get_driver_instance()` is now only available in dynamic library builds - static builds do not have this symbol. This was done to accommodate loading the DLL with `LoadLibrary` or `dlopen`. If you do not use `CMake` for building the source code you will need to define `mysqlcppconn_EXPORTS` if you are loading dynamically and want to use the `get_driver_instance()` entry point.
- Connection map property `OPT_RECONNECT` was changed to be of type `boolean` from `long long`.
- `LDFLAGS`, `CXXFLAGS` and `CPPFLAGS` are now checked from the environment for every binary generated.
- Instances of `std::auto_ptr` have been changed to `boost::scoped_ptr`. Scoped array instances now use boost::scoped_array. Further, `boost::shared_ptr` and `boost::weak_ptr` are now used for guarding access around result sets.

Bugs Fixed

- Certain header files were incorrectly present in the source distribution. The fix excludes dynamically generated and platform specific header files from source packages generated using CPack. (Bug #45846)
- `CMake` generated an error if configuring an out of source build, that is, when `CMake` was not called from the source root directory. (Bug #45843)
- Using Prepared Statements caused corruption of the heap. (Bug #45048)
- Missing includes when using GCC 4.4. Note that GCC 4.4 is not yet in use for any official MySQL Connector/C++ builds. (Bug #44931)
- A bug was fixed in Prepared Statements. The bug occurred when a stored procedure was prepared without any parameters. This led to an exception. (Bug #44931)
- Fixed bug in `ResultSetMetaData` for statements and prepared statements, `getScale` and `getPrecision` returned incorrect results.
- Fixed a Prepared Statements performance issue. Reading large result sets was slow.

D.7.2. Changes in MySQL Connector/C++ 1.0.x

D.7.2.1. Changes in MySQL Connector/CPP 1.0.5 (21 April 2009)

This is the first Generally Available (GA) release.

Functionality Added or Changed

- Added better support for named pipes, on Windows. Use `pipe://` and add the path to the pipe. Shared memory connections are currently not supported.
- Enabled tracing functionality when building with Microsoft Visual C++ 8 and later, which corresponds to Microsoft Visual Studio 2005 and later.
- Added `Result::getType()`. Implemented for the three result set classes.

- Added the option `defaultStatementResultType` to `MySQL_Connection::setClientOption()`. Also, the method now returns `sql::Connection *`.
- Implemented `getResultSetType()` for `PreparedStatement`. The setter is not implemented because currently `PreparedStatement` cannot do refetching. Storing the result means the bind buffers will be correct.
- Implemented `getResultSetType()` and `setResultSetType()` for `Statement`. Uses `TYPE_FORWARD_ONLY`, which means unbuffered result set and `TYPE_SCROLL_INSENSITIVE`, which means buffered result set.
- Changed the return type of `sql::SQLException::getSQLState()` from `std::string` to `const char *` to be consistent with `std::exception::what()`.
- Changed the interface of `sql::Driver` and `sql::Connection` so they accept the options map by alias instead of by value.
- Improved memory management. Potential memory leak situations are handled more robustly.
- The interface of `sql::ConnectionMetaData`, `sql::ResultSetMetaData` and `sql::ParameterMetaData` was modified to have a protected destructor. As a result the client code has no need to destruct the metadata objects returned by the connector. MySQL Connector/C++ handles the required destruction. This enables statements such as:

  ```
  connection->getMetaData->getSchema();
  ```

  This avoids potential memory leaks that could occur as a result of losing the pointer returned by `getMetaData()`.

Bugs Fixed

- A bug was fixed in `MySQL_Connection::setSessionVariable()`, which had been causing exceptions to be thrown.

D.7.2.2. Changes in MySQL Connector/CPP 1.0.4 (31 March 2009, beta)

Functionality Added or Changed

- Introduced `ResultSetMetaData::isZerofill()`, which is not in the JDBC specification.
- Added support for MySQL Connector/C.
- Implemented `MySQL_ConnectionMetaData::supportsConvert(from, to)`.
- `metadataUseInfoSchema` was added to the connection property map, which enables control of the `INFORMATION_SCHEMA` for metadata.
- Minimum `CMake` version required was changed from 2.4.2 to 2.6.2. The latest version is required for building on Windows.
- An installer was added for the Windows operating system.

Bugs Fixed

- A leak was fixed in `MySQL_PreparedResultSet`, which occurred when the result contained a `BLOB` column.
- A bug was fixed in all implementations of `ResultSet::relative()` which was giving a wrong return value although positioning was working correctly.

D.7.2.3. Changes in MySQL Connector/CPP 1.0.3 (02 March 2009, alpha)

Functionality Added or Changed

- Implemented `MySQL_DatabaseMetaData::getCrossReference()`.
- Implemented `MySQL_DatabaseMetaData::getExportedKeys()`.
- Improved the implementation for `ResultSetMetaData::isReadOnly()`. Values generated from views are read only. These generated values don't have `db` in `MYSQL_FIELD` set, while all normal columns do have.

- Introduced `ResultSet::getUInt()` and `ResultSet::getUInt64()`.
- Renamed `ResultSet::getLong()` to `ResultSet::getInt64()`. `resultset.h` includes typdefs for Windows to be able to use `int64_t`.
- Introduced, internally, `sql::mysql::MyVal` which has implicit constructors. Used in `mysql_metadata.cpp` to create result sets with native data instead of always string (varchar).
- Changed the implementation of `MySQL_ConstructedResultSet` to use the more efficient O(1) access method. This should improve the speed with which the metadata result sets are used. Also, there is less copying during the construction of the result set, which means that all result sets returned from the metadata functions will be faster.
- Re-added `getTypeInfo()` with information about all types supported by MySQL and the `sql::DataType`.
- `make package_source` now packs with bzip2.
- Implemented `MySQL_ConnectionMetaData::getProcedureColumns()`.
- Implementation for `MySQL_DatabaseMetaData::getImportedKeys()` for MySQL versions before 5.1.16 using `SHOW`, and above using `INFORMATION_SCHEMA`.
- `cppconn/datatype.h` has changed and is now used again. Reimplemented the type subsystem to be more usable - more types for binary and nonbinary strings.
- Implemented `MySQL_DatabaseMetaData::getColumnPrivileges()`.
- Implemented `MySQL_Connection::setSessionVariable()` for setting variables like `sql_mode`.
- Fixed `MySQL_DatabaseMetaData::getTablePrivileges()`. Test cases were added in the first unit testing framework.
- Implemented `ResultSet::getBlob()` which returns `std::stream`.
- New `BLOB` implementation. `sql::Blob` was removed in favor of `std::istream`. C++'s `IOStream` library is very powerful, similar to PHP's streams. It makes no sense to reinvent the wheel. For example, you can pass a `std::istringstream` object to `setBlob()` if the data is in memory, or just open a file `std::fstream` and let it stream to the DB, or write its own stream. This is also true for `getBlob()` where you can just copy data (if a buffered result set), or stream data (if implemented).
- Added properties enabled methods for connecting, which add many connect options. This uses a dictionary (map) of key value pairs. Methods added are `Driver::connect(map)`, and `Connection::Connection(map)`.
- Experimental support for STLPort. This feature may be removed again at any time later without prior warning! Type `cmake -L` for configuration instructions.
- Addition of `test/unit/README` with instructions for writing bug and regression tests.
- Major performance improvements due to new buffered `ResultSet` implementation.
- `MySQL_Driver::getPatchVersion` introduced.
- New data types added to the list returned by `DatabaseMetaData::getTypeInfo()` are `FLOAT UNSIGNED`, `DECIMAL UNSIGNED`, `DOUBLE UNSIGNED`. Those tests may not be in the JDBC specification. However, due to the change you should be able to look up every type and type name returned by, for example, `ResultSetMetaData::getColumnTypeName()`.
- Added new tests in `test/unit/classes`. Those tests are mostly about code coverage. Most of the actual functionality of the driver is tested by the tests found in `test/CJUnitPort`.

Bugs Fixed

- Fixed handling of numeric columns in `ResultSetMetaData::isCaseSensitive` to return `false`.
- Corrected handling of unsigned server types. Now returning correct values.
- Bug fixed in `MySQL_PreparedResultSet::getString()`. Returned string that had real data but the length was random. Now, the string is initialized with the correct length and thus is binary safe.

D.7.2.4. Changes in MySQL Connector/CPP 1.0.2 (19 December 2008, alpha)

Functionality Added or Changed

- Added `test/unit` as a basis for general unit tests using the new test framework, see `test/unit/example` for basic usage examples.
- Added new unit test framework for JDBC compliance and regression testing.
- Implemented `MySQL_ResultSetMetaData::getPrecision()` and `MySQL_Prepared_ResultSetMetaData::getPrecision()`, updating example.
- Added PHP script `examples/cpp_trace_analyzer.php` to filter the output of the debug trace. Please see the inline comments for documentation. This script is unsupported.
- Implemented `MySQL_PreparedStatement::clearParameters()`.
- Implemented `MySQL_PreparedStatement::setNull()`.
- Reverted implementation of `MySQL_DatabaseMetaData::getTypeInfo()`. Now unimplemented. In addition, removed `cppconn/datatype.h` for now, until a more robust implementation of the types can be developed.
- `DATE`, `DATETIME` and `TIME` are now being handled when calling the `MySQL_PreparedResultSet` methods `getString()`, `getDouble()`, `getInt()`, `getLong()`, `getBoolean()`.
- Changed `ResultSetMetaData` methods `getColumnDisplaySize()`, `getPrecision()`, `getScale()` to return `unsigned int` instead of `signed int`.
- Implemented `getScale()`, `getPrecision()` and `getColumnDisplaySize()` for `MySQL_ResultSetMetaData` and `MySQL_Prepared_ResultSetMetaData`.

Bugs Fixed

- Fixed `MySQL_PreparedStatement::setBlob()`. In the tests there is a simple example of a class implementing `sql::Blob`.
- Fixed bug in `FLOAT` handling.
- Fixed a bug in `getString()`. `getString()` is now binary safe. A new example was also added.
- Fixed bugs in the `MySQL_PreparedStatements` methods `setBigInt()` and `setDatetime()`. They decremented the internal column index before forwarding the request. This resulted in a double-decrement and therefore the wrong internal column index. The error message generated was:

```
setString() ... invalid "parameterIndex"
```

- Fixed bugs in `MySQL_DatabaseMetaData`. All `supportsCatalogXXXXX` methods were incorrectly returning `true` and all `supportsSchemaXXXX` methods were incorrectly returning `false`. Now `supportsCatalogXXXXX` returns `false` and `supportsSchemaXXXXX` returns `true`.
- Fixed a bug in `MySQL_ConnectionMetaData::getColumns()` which was performing a cartesian product of the columns in the table times the columns matching `columnNamePattern`. The example `example/connection_meta_schemaobj.cpp` was extended to cover the function.
- Fixed bug in `MySQL_ConnectionMetaData::getIndexInfo()`. The method did not work because the schema name wasn't included in the query sent to the server.
- Fixed `MySQL_PreparedStatementResultSet::getDouble()` to return the correct value when the underlying type is `MYSQL_TYPE_FLOAT`.

D.7.2.5. Changes in MySQL Connector/CPP 1.0.1 (01 December 2008, alpha)

Functionality Added or Changed

- New directory layout.

- MySQL Workbench 5.1 changed to use MySQL Connector/C++ for its database connectivity.
- Converted Connector/J tests added.
- Changed `sql::DbcException` to implement the interface of JDBC's `SQLException`. Renamed to `sql::SQLException`.
- Renamed `sql::DbcInvalidArgument` to `sql::InvalidArgumentException`
- Renamed `sql::DbcMethodNotImplemented` to `sql::MethodNotImplementedException`
- All tests changed to create TAP compliant output.
- Introduced experimental CPack support, see make help.
- Changed metadata column name `TABLE_CATALOG` to `TABLE_CAT` and `TABLE_SCHEMA` to `TABLE_SCHEM` to ensure JDBC compliance.
- Renamed `ConnectionMetaData::getImportedKeys(): PKTABLE_CATALOG` to `PKTABLE_CAT`, `PKTABLE_SCHEMA` to `PKTABLE_SCHEM`, `FKTABLE_CATALOG` to `FKTABLE_CAT`, `FKTABLE_SCHEMA` to `FKTABLE_SCHEM`.
- Renamed `ConnectionMetaData::getPrimaryKeys(): COLUMN` to `COLUMN_NAME`, `SEQUENCE` to `KEY_SEQ`, and `INDEX_NAME` to `PK_NAME`.
- Renamed `ConnectionMetaData::getProcedures: PROCEDURE_SCHEMA` to `PROCEDURE_SCHEM`.
- Renamed `ConnectionMetaData::getTables: TABLE_COMMENT` to `REMARKS`.
- All examples can be given optional connection parameters on the command line, for example:

  ```
  examples/connect tcp://host:port user pass database
  ```

  or

  ```
  examples/connect unix:///path/to/mysql.sock user pass database
  ```

- Added experimental GCov support, `cmake -DMYSQLCPPCONN_GCOV_ENABLE:BOOL=1`
- `ConnectionMetaData::getCatalogTerm()` returns not applicable, there is no counterpart to catalog in MySQL Connector/C++.
- Added `ConnectionMetaData::getSchemas()` and `Connection::setSchema()`.
- Driver Manager was removed.
- Support for (n)make install was added. You can change the default installation path. Carefully read the messages displayed after executing cmake. The following are installed:
  - Static and the dynamic version of the library, `libmysqlcppconn`.
  - Generic interface, `cppconn`.
  - Two MySQL specific headers:

    `mysql_driver.h`, use this if you want to get your connections from the driver instead of instantiating a `MySQL_Connection` object. This makes your code portable when using the common interface.

    `mysql_connection.h`, use this if you intend to link directly to the `MySQL_Connection` class and use its specifics not found in `sql::Connection`.

    However, you can make your application fully abstract by using the generic interface rather than these two headers.
- `sql::mysql::MySQL_SQLException` was removed. The distinction between server and client (connector) errors, based on the type of the exception, has been removed. However, the error code can still be checked to evaluate the error type.

D.8. MySQL Proxy Change History

D.8.1. Changes in MySQL Proxy 0.8.2 (18 August 2011)

MySQL Proxy 0.8.2 is a maintenance release and focuses on these areas:

- Adding the protocol changes of MySQL 5.5 and later
- Removing the “admin” plugin from the list of default plugins, as it requires configuration since 0.8.1

Note to Windows Users

- The Microsoft Visual C++ runtime libraries are now a requirement for running MySQL Proxy. Users that do not have these libraries must download and install the Microsoft Visual C++ 2008 Service Pack 1 Redistributable Package MFC Security Update. For the current Proxy version, use the following link to obtain the package:

  ```
  http://www.microsoft.com/download/en/details.aspx?displaylang=en&id=26368
  ```

  (Bug #12836100)

Functionality Added or Changed

- Added support for binary log checksums.
- Added support for decoding *all* data types of the row-based replication protocol.
- Added support for `OUT` parameters in prepared statements in stored procedures with MySQL 5.5.
- Removed the “admin” plugin from the list of default plugins, as it requires configuration since 0.8.1.

Bugs Fixed

- Fixed handling of stored procedures with cursors with MySQL 5.5. (Bug #61998)
- A crash occurred if the file named with the `--defaults-file` option did not exist. (Bug #59790)
- The first characters of log messages were stripped. (Bug #59790)
- A memory leak occurred if connection pooling was used. (Bug #56620)
- Fixed handling of “used columns” with row-based replication.
- A crash could occur if run under Valgrind.
- A bogus timestamp log was produced if state tracking was not compiled in.

D.8.2. Changes in MySQL Proxy 0.8.1 (13 September 2010)

Functionality Added or Changed

- `con->in_load_data_local` has been removed.
- Shutdown hooks were added to free the global memory of third-party libraries such as `openssl`.
- `chassis_set_fdlimit()` has been deprecated in favor of `chassis_fdlimit_set()`.
- The unused `network_mysqld_com_query_result_track_state()` function has been deprecated.
- Allow interception of `LOAD DATA INFILE` and `SHOW ERRORS` statements.

Bugs Fixed

- The admin plugin had an undocumented default value for `--admin-password`. (Bug #53429)
- `network_address_set_address()->network_address_set_address_ip()` called `gethostbyname()`

which was not reentrant. This meant that a MySQL Proxy plugin needed to guard all calls to `network_address_set_address()` with a mutex. `network_address_set_address()` has been modified to be thread safe. (Bug #49099)

- If the backend MySQL server went down, and then the clock on the MySQL Proxy host went backward (for example, during daylight saving time adjustments), Proxy stopped forwarding queries to the backend. (Bug #50806)
- The hard limit was fixed for the case where the fdlimit was set. (Bug #48120)
- MySQL Proxy returned an error message with a nonstandard SQL State when all backends were down:

```
"#07000(proxy) all backends are down"
```

  This caused issues for clients with “retry” logic, as they could not handle these “custom” SQL States. (Bug #45417)
- Use of `LOAD DATA LOCAL INFILE` caused the connection between the client and MySQL Proxy to abort. (Bug #51864)
- The `--proxy-read-only-backend-addresses` option did not work. (Bug #38341, Bug #11749171)
- If MySQL Proxy used a UNIX socket, it did not remove the socket file at termination time. (Bug #38415)
- When running `configure` to build, the error message relating to the `lua` libraries could be misleading. The wording and build advice have been updated.

D.8.3. Changes in MySQL Proxy 0.8.0 (21 January 2010)

Functionality Added or Changed

- The `--no-daemon` has been renamed to The `--daemon`. By default, MySQL Proxy now starts in foreground mode. Use the `--daemon` option to override this and start in daemon mode.

Bugs Fixed

- MySQL Proxy would load a configuration file with unsafe permissions, which could permit password information to be exposed through the file. MySQL Proxy now refuses to load a configuration file with unsafe permissions. (Bug #47589)
- A memory leak occurred in MySQL Proxy if clients older than MySQL 4.1 connected to it. (Bug #50993)
- A segmentation fault occurred in MySQL Proxy if clients older than MySQL 4.1 connected to it. (Bug #48641)
- Several supplied scripts were updated to account for flag and structure changes:
  - `active-transactions.lua` was updated to use the `resultset_is_needed` flag.
  - `ro-balance.lua` was updated to use the `resultset_is_needed` flag and updated `proxy.connection.dst.name` structure.
  - `rw-splitting.lua` was updated to use the `resultset_is_needed` flag and updated `proxy.connections` structure.

  (Bug #47349, Bug #45408, Bug #47345, Bug #43424, Bug #42841, Bug #46141)
- MySQL Proxy accepted more than one address in the value of the `--proxy-backend-addresses` option. You should specify one `--proxy-backend-addresses` option for each backend address. (Bug #47273)
- MySQL Proxy returned the wrong version string internally from the `proxy.PROXY_VERSION` constant. (Bug #45996)
- MySQL Proxy failed to work with certain versions of MySQL, including MySQL 5.1.15, where a change in the MySQL protocol existed. Now Proxy denies `COM_CHANGE_USER` commands when it is connected to MySQL 5.1.14 to 5.1.17 servers by sending back an error: `COM_CHANGE_USER is broken on 5.1.14-.17, please upgrade the MySQL Server`. (Bug #45167)

  References: See also Bug #25371.
- The line numbers provided in stack traces were off by one. (Bug #47348)
- Due to a memory leak, memory usage for each new connection to the proxy increased, leading to very high consumption. (Bug

#45272)

- MySQL Proxy could stop accepting network packets if it received a large number of packets. The listen queue has been extended to permit a larger backlog. (Bug #45878, Bug #43278)
- Logging to `syslog` with the `--log-use-syslog` option did not work. (Bug #36431)
- MySQL Proxy raised an error when processing query packets larger than 16MB. (Bug #35202)
- MySQL Proxy could incorrectly insert `NULL` values into the returned result set, even though non-`NULL` values were returned in the original query. (Bug #35729)

D.8.4. Changes in MySQL Proxy 0.7.2 (30 June 2009)

Bugs Fixed

- On Windows, MySQL Proxy might not find the required modules during initialization. The core code has been updated to find the components correctly, and the Lua-based C modules are prefixed with `lua-` and Lua plugins with `plugin-`. (Bug #45833)

D.8.5. Changes in MySQL Proxy 0.7.1 (15 May 2009)

Bugs Fixed

- Due to a memory leak, memory usage for each new connection to the proxy increased, leading to very high consumption. (Bug #45272)
- When using the `rw-splitting.lua` script, you could get an error when talking to the backend server:

```
2008-07-28 18:00:30: (critical) (read_query) [string
"/usr/local/share/mysql-proxy/rw-splitting.l..."]:218: bad argument #1 to 'ipairs' (table
expected, got userdata)
```

  This led to Proxy closing the connection to the configured MySQL backend. (Bug #38419)
- MySQL Proxy was unable to increase its own maximum number of open files according to the limit specified by the `--max-open-files` option, if the limit was less than 8192. When set to debug level, Proxy now reports the open files limit and when the limit has been updated. (Bug #42783)
- MySQL Proxy crashed when connecting to a MySQL 4.0 server. Now it generates an error message instead. (Bug #38601)
- Result sets with more than 250 fields could cause MySQL Proxy to crash. (Bug #43078)
- The port number was reported incorrectly in `proxy.connection.client.address`. (Bug #43313)
- When using MySQL Proxy with multiple backends, failure of one backend caused Proxy to disconnect all backends and stop routing requests. (Bug #34793)

D.8.6. Changes in MySQL Proxy 0.7.0 (Not Released)

Functionality Added or Changed

- Support for using a configuration file, in addition to the command-line options, has been added. To specify such a file, use the `--defaults-file=file_name` command-line option. See Section 14.7.3, “MySQL Proxy Command Options”. (Bug #30206)
- A number of the internal structures developed for use with Lua scripts that work with MySQL Proxy have been updated and harmonized to make their meaning and contents easier to use and consistent across multiple locations.
  - The address information has been updated. Instead of a combined `ip:port` structure that you had to parse to extract the individual information, you can now access that information directly. For example, instead of structures providing a single `.address` item, you now have these items: `name` (the combined `ip:port`), `address` (the IP address), and `port` (port number). In addition, all addresses now supply both the `src` (source) and `dst` (destination) socket information for both ends of connections.

Some familiar structures have been updated to accommodate this information:

- `proxy.connection.client.address` is `proxy.connection.client.src.name`
- `proxy.connection.server.address` is `proxy.connection.server.dst.name`

- `proxy.backends` is now in `proxy.global.backends` The `.address` field of each backend is an address-object as described earlier. For example, `proxy.backends[1].address` is `proxy.global.backends[1].dst.name`.
- The `read_auth()` and `read_handshake()` functions no longer receive an `auth` parameter. Instead, all the data is available in the connection tables.

  In `read_handshake()`, you access the information through the global `proxy.connection` table:

0.6	0.7
`auth.thread_id`	`proxy.connection.server.thread_id`
`auth.mysqld_version`	`proxy.connection.server.mysqld_version`
`auth.server_addr`	`proxy.connection.server.dst.name`
`auth.client_addr`	`proxy.connection.client.src.name`
`auth.scramble`	`proxy.connection.server.scramble_buffer`

  In `read_auth()`, you can use the following:

0.6	0.7
`auth.username`	`proxy.connection.client.username`
`auth.password`	`proxy.connection.client.scrambled_password`
`auth.default_db`	`proxy.connection.client.default_db`
`auth.server_addr`	`proxy.connection.server.dst.name`
`auth.client_addr`	`proxy.connection.client.src.name`

- In the `proxy.queries:append()` function, a third parameter is an (optional) table with options specific to the this packet. Specifically, if you want to have access to the result set in the `read_query_result()` hook, you must set the `resultset_is_needed` flag:

```
proxy.queries:append( 1, ..., { resultset_is_needed = true } )
```

  For more information, see proxy.queries [1426].

- `proxy.backends` is now in `proxy.global.backends`.

Bugs Fixed

- **Security Enhancement**: Accessing MySQL Proxy using a client or backend from earlier than MySQL 4.1 resulted in Proxy aborting with an assertion. This is because Proxy supports only MySQL 4.1 or higher. Proxy now reports a fault. (Bug #31419)
- MySQL Proxy was configured with the `LUA_PATH` and `LUA_CPATH` directory locations according to the build host rather than the execution host. In addition, during installation, certain Lua source files could be installed into the incorrect locations. (Bug #44877, Bug #44497)
- Using MySQL Proxy with very large return data sets from queries could cause a crash, with or without manipulation of the data set within the Lua engine. (Bug #39332)
- MySQL Proxy terminated if a submitted packet was smaller than expected by the protocol. (Bug #36743)
- When using MySQL Proxy in a master-master replication scenario, Proxy failed to identify failure in one of the replication masters and did not redirect connections to the other master. (Bug #35295)

D.8.7. Changes in MySQL Proxy 0.6.1 (06 February 2008)

Functionality Added or Changed

- Added new features to `run-tests.lua`.
- Fixed error handling for socket functions on Windows.
- Fixed sending fake server-greetings in `connect_server()`.
- Fixed assertions on write errors.

D.8.8. Changes in MySQL Proxy 0.6.0 (11 September 2007)

Functionality Added or Changed

- When using read/write splitting and the `rw-splitting.lua` example script, connecting a second user to the proxy returns an error message. (Bug #30867)
- Added connection pooling.
- Added a global Lua-scope `proxy.global.*`.
- Added support for listening UNIX sockets.
- Added `--no-proxy` to disable the proxy.
- Added test cases.
- Added support for `proxy.response.packets`.
- Added handling of `proxy.connection.backend_ndx` in `connect_server()` and `read_query()` to support read/write splitting.
- Added hooks for `read_auth()`, `read_handshake()` and `read_auth_result()`.
- By default, MySQL Proxy now starts in daemon mode. Use the new `--no-daemon` option to override this. Added the `--pid-file` option for writing the process ID to a file after becoming a daemon.
- Added support in `read_query_result()` to overwrite the result set.

Bugs Fixed

- Fixed an assertion that MySQL Proxy raised at login time if a client specified no password and no default database. (Bug #29719)
- Fixed an assertion on result-packets like `[field-len | fields | EOF | ERR]`. (Bug #29732)
- Fixed an assertion on `COM_BINLOG_DUMP`. (Bug #29764)
- Fixed an assertion at `COM_SHUTDOWN`. (Bug #29719)
- Fixed a memory leak when `proxy.response.*` is used.
- Fixed handling of (SQL) `NULL` in result sets.
- Fixed `inj.resultset.affected_rows` on `SELECT` queries.
- Fixed decoding of length-encoded ints for 3-byte notation.
- Fixed an assertion when connecting to MySQL 6.0.1.
- Fixed compilation on win32.
- Fixed length encoding on `proxy.resultsets`.
- Fixed connection stalling if `read_query_result()` raised an assertion.

- Fixed an assertion at connect time when all backends are down.
- Fixed the `glib2` check to require at least `glib2` 2.6.0.
- Fixed a crash if `proxy.connection` is used in `connect_server()`.

D.8.9. Changes in MySQL Proxy 0.5.1 (30 June 2007)

Functionality Added or Changed

- Added protection against duplicate result sets from a script.
- Added support for UNIX sockets.
- Added `proxy.VERSION`.
- Added script examples for rewriting and injection.
- Added support for pre-4.1 passwords in a 4.1 connection.
- Added `inj.query_time` and `inj.response_time` into the Lua scripts.
- Added missing dependency to `libmysqlclient-dev` to the `INSTALL` file.
- Changed `--proxy.profiling` to `--proxy-skip-profiling`.
- Added `resultset.affected_rows` and `resultset.insert_id`.

Bugs Fixed

- Fixed an assertion when `read_query_result()` is not provided when `PROXY_SEND_QUERY` is used.
- Fixed an assertion when an error occurs at initial script exec time.
- Fixed a warning if `connect_server()` is not provided.
- Fixed a crash on fields longer than 250 bytes when the result set is inspected.
- Fixed a compile error with MySQL 4.1.x on missing `COM_STMT_*`.
- Fixed handling of duplicate ERR on `COM_CHANGE_USER` in MySQL 5.1.18+.
- Fixed mysql check in `configure` to die when `mysql.h` isn't detected.

D.8.10. Changes in MySQL Proxy 0.5.0 (19 June 2007)

This is the first beta release.

Bugs Fixed

- Added `CMake` support.
- Added `automake`/`autoconf` support.

E.10.5. Windows Platform Limitations 3278

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries or views.

E.1. Restrictions on Stored Programs

These restrictions apply to the features described in Chapter 18, *Stored Programs and Views*.

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. There are also some restrictions specific to stored functions but not to stored procedures.

The restrictions for stored functions also apply to triggers. There are also some restrictions specific to triggers.

The restrictions for stored procedures also apply to the `DO` clause of Event Scheduler event definitions. There are also some restrictions specific to events.

SQL Statements Not Permitted in Stored Routines

Stored routines cannot contain arbitrary SQL statements. The following statements are not permitted:

- The locking statements `LOCK TABLES` and `UNLOCK TABLES`.
- `ALTER VIEW`.
- `LOAD DATA` and `LOAD TABLE`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`) can be used in stored procedures, but not stored functions or triggers. Thus, stored functions and triggers cannot use dynamic SQL (where you construct statements as strings and then execute them).
- Generally, statements not permitted in SQL prepared statements are also not permitted in stored programs. For a list of statements supported as prepared statements, see Section 12.5, “SQL Syntax for Prepared Statements”. Exceptions are `SIGNAL` and `RESIGNAL`, which are not permissible as prepared statements but are permitted in stored programs.
- Inserts cannot be delayed. `INSERT DELAYED` syntax is accepted, but the statement is handled as a normal `INSERT`.
- Within all stored programs (stored procedures and functions, triggers, and events), the parser treats `BEGIN [WORK]` as the beginning of a `BEGIN ... END` block. To begin a transaction in this context, use `START TRANSACTION` instead.

Restrictions for Stored Functions

The following additional statements or operations are not permitted within stored functions. They are permitted within stored procedures, except stored procedures that are invoked from within a stored function or trigger. For example, if you use `FLUSH` in a

stored procedure, that stored procedure cannot be called from a stored function or trigger.

- Statements that perform explicit or implicit commit or rollback. Support for these statements is not required by the SQL standard, which states that each DBMS vendor may decide whether to permit them.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO var_list` clause and other statements such as `SHOW`, `EXPLAIN`, and `CHECK TABLE`. A function can process a result set either with `SELECT ... INTO var_list` or by using a cursor and `FETCH` statements. See Section 12.2.9.1, “`SELECT ... INTO` Syntax”, and Section 12.6.6, “Cursors”.
- `FLUSH` statements.
- Stored functions cannot be used recursively.
- A stored function or trigger cannot modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- If you refer to a temporary table multiple times in a stored function under different aliases, a `Can't reopen table: 'tbl_name'` error occurs, even if the references occur in different statements within the function.
- `HANDLER ... READ` statements that invoke stored functions can cause replication errors. As of MySQL 5.5.7, such statements are disallowed.

Restrictions for Triggers

For triggers, the following additional restrictions apply:

- Triggers currently are not activated by foreign key actions.
- When using row-based replication, triggers on the slave are not activated by statements originating on the master. The triggers on the slave are activated when using statement-based replication. For more information, see Section 15.4.1.30, “Replication and Triggers”.
- The `RETURN` statement is not permitted in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not permitted on tables in the `mysql` database.
- The trigger cache does not detect when metadata of the underlying objects has changed. If a trigger uses a table and the table has changed since the trigger was loaded into the cache, the trigger operates using the outdated metadata.

Name Conflicts within Stored Routines

The same identifier might be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
  DECLARE i INT DEFAULT 0;
  SELECT i FROM t;
  BEGIN
    DECLARE i INT DEFAULT 1;
    SELECT i FROM t;
  END;
END;
```

In such cases, the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column.
- A routine parameter takes precedence over a table column.
- A local variable in an inner block takes precedence over a local variable in an outer block.

The behavior that variables take precedence over table columns is nonstandard.

Replication Considerations

Use of stored routines can cause replication problems. This issue is discussed further in Section 18.7, “Binary Logging of Stored Programs”.

The `--replicate-wild-do-table=db_name.tbl_name` option applies to tables, views, and triggers. It does not apply to stored procedures and functions, or events. To filter statements operating on the latter objects, use one or more of the `--replicate-*-db` options.

Debugging Considerations

There are no stored routine debugging facilities.

Unsupported Syntax from the SQL:2003 Standard

The MySQL stored routine syntax is based on the SQL:2003 standard. The following items from that standard are not currently supported:

- `UNDO` handlers
- `FOR` loops

Concurrency Considerations

To prevent problems of interaction between sessions, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. While the statement executes, it does not see changes to routines performed by other sessions.

For maximum concurrency, stored functions should minimize their side-effects; in particular, updating a table within a stored function can reduce concurrent operations on that table. A stored function acquires table locks before executing, to avoid inconsistency in the binary log due to mismatch of the order in which statements execute and when they appear in the log. When statement-based binary logging is used, statements that invoke a function are recorded rather than the statements executed within the function. Consequently, stored functions that update the same underlying tables do not execute in parallel. In contrast, stored procedures do not acquire table-level locks. All statements executed within stored procedures are written to the binary log, even for statement-based binary logging. See Section 18.7, “Binary Logging of Stored Programs”.

Event Scheduler Restrictions

The following limitations are specific to the Event Scheduler:

- Event names are handled in case-insensitive fashion. For example, you cannot have two events in the same database with the names `anEvent` and `AnEvent`.
- An event may not be created, altered, or dropped by a stored routine, trigger, or another event. An event also may not create, alter, or drop stored routines or triggers. (Bug #16409, Bug #18896)
- As of MySQL 5.5.8, DDL statements on events are prohibited while a `LOCK TABLES` statement is in effect.
- Event timings using the intervals `YEAR`, `QUARTER`, `MONTH`, and `YEAR_MONTH` are resolved in months; those using any other interval are resolved in seconds. There is no way to cause events scheduled to occur at the same second to execute in a given order. In addition—due to rounding, the nature of threaded applications, and the fact that a nonzero length of time is required to create events and to signal their execution—events may be delayed by as much as 1 or 2 seconds. However, the time shown in the `INFORMATION_SCHEMA.EVENTS` table's `LAST_EXECUTED` column or the `mysql.event` table's `last_executed` column is always accurate to within one second of the actual event execution time. (See also Bug #16522.)
- Each execution of the statements contained in the body of an event takes place in a new connection; thus, these statements has no effect in a given user session on the server's statement counts such as `Com_select` and `Com_insert` that are displayed by `SHOW STATUS`. However, such counts *are* updated in the global scope. (Bug #16422)
- Events do not support times later than the end of the Unix Epoch; this is approximately the beginning of the year 2038. Such dates are specifically not permitted by the Event Scheduler. (Bug #16396)
- References to stored functions, user-defined functions, and tables in the `ON SCHEDULE` clauses of `CREATE EVENT` and `ALTER EVENT` statements are not supported. These sorts of references are not permitted. (See Bug #22830 for more information.)
- Generally speaking, statements that are not permitted in stored routines or in SQL prepared statements are also not permitted in

the body of an event. For more information, see Section 12.5, “SQL Syntax for Prepared Statements”.

Stored routines and triggers in MySQL Cluster. Stored procedures, stored functions, and triggers are all supported by tables using the NDB storage engine; however, it is important to keep in mind that they do *not* propagate automatically between MySQL Servers acting as Cluster SQL nodes. This is because of the following:

- Stored routine definitions are kept in tables in the mysql system database using the MyISAM storage engine, and so do not participate in clustering.
- The .TRN and .TRG files containing trigger definitions are not read by the NDB storage engine, and are not copied between Cluster nodes.

Any stored routine or trigger that interacts with MySQL Cluster tables must be re-created by running the appropriate CREATE PROCEDURE, CREATE FUNCTION, or CREATE TRIGGER statements on each MySQL Server that participates in the cluster where you wish to use the stored routine or trigger. Similarly, any changes to existing stored routines or triggers must be carried out explicitly on all Cluster SQL nodes, using the appropriate ALTER or DROP statements on each MySQL Server accessing the cluster.

> **Warning**
>
> Do *not* attempt to work around the issue described in the first item mentioned previously by converting any mysql database tables to use the NDB storage engine. *Altering the system tables in the mysql database is not supported* and is very likely to produce undesirable results.

E.2. Restrictions on Condition Handling

SIGNAL and RESIGNAL are not permissible as prepared statements. For example, this statement is invalid:

```
PREPARE stmt1 FROM 'SIGNAL SQLSTATE "02000"';
```

SQLSTATE values in class '04' are not treated specially. They are handled the same as other exceptions.

E.3. Restrictions on Server-Side Cursors

Server-side cursors are implemented in the C API using the mysql_stmt_attr_set() function. The same implementation is used for cursors in stored routines. A server-side cursor enables a result set to be generated on the server side, but not transferred to the client except for those rows that the client requests. For example, if a client executes a query but is only interested in the first row, the remaining rows are not transferred.

In MySQL, a server-side cursor is materialized into an internal temporary table. Initially, this is a MEMORY table, but is converted to a MyISAM table when its size exceeds the minimum value of the max_heap_table_size and tmp_table_size system variables. Note that the same restrictions apply to internal temporary tables created to hold the result set for a cursor as for other uses of internal temporary tables. See Section 7.4.3.3, “How MySQL Uses Internal Temporary Tables”. One limitation of the implementation is that for a large result set, retrieving its rows through a cursor might be slow.

Cursors are read only; you cannot use a cursor to update rows.

UPDATE WHERE CURRENT OF and DELETE WHERE CURRENT OF are not implemented, because updatable cursors are not supported.

Cursors are nonholdable (not held open after a commit).

Cursors are asensitive.

Cursors are nonscrollable.

Cursors are not named. The statement handler acts as the cursor ID.

You can have open only a single cursor per prepared statement. If you need several cursors, you must prepare several statements.

You cannot use a cursor for a statement that generates a result set if the statement is not supported in prepared mode. This includes statements such as CHECK TABLE, HANDLER READ, and SHOW BINLOG EVENTS.

E.4. Restrictions on Subqueries

- A subquery's outer statement can be any one of: `SELECT`, `INSERT`, `UPDATE`, `DELETE`, `SET`, or `DO`.
- Subquery optimization for `IN` is not as effective as for the `=` operator or for the `IN(value_list)` operator.

  A typical case for poor `IN` subquery performance is when the subquery returns a small number of rows but the outer query returns a large number of rows to be compared to the subquery result.

  The problem is that, for a statement that uses an `IN` subquery, the optimizer rewrites it as a correlated subquery. Consider the following statement that uses an uncorrelated subquery:

  ```
  SELECT ... FROM t1 WHERE t1.a IN (SELECT b FROM t2);
  ```

  The optimizer rewrites the statement to a correlated subquery:

  ```
  SELECT ... FROM t1 WHERE EXISTS (SELECT 1 FROM t2 WHERE t2.b = t1.a);
  ```

  If the inner and outer queries return *M* and *N* rows, respectively, the execution time becomes on the order of O(*M*×*N*), rather than O(*M*+*N*) as it would be for an uncorrelated subquery.

  An implication is that an `IN` subquery can be much slower than a query written using an `IN(value_list)` operator that lists the same values that the subquery would return.
- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

  ```
  DELETE FROM t WHERE ... (SELECT ... FROM t ...);
  UPDATE t ... WHERE col = (SELECT ... FROM t ...);
  {INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
  ```

  Exception: The preceding prohibition does not apply if you are using a subquery for the modified table in the `FROM` clause. Example:

  ```
  UPDATE t ... WHERE col = (SELECT * FROM (SELECT ... FROM t...) AS _t ...);
  ```

  Here the result from the subquery in the `FROM` clause is stored as a temporary table, so the relevant rows in `t` have already been selected by the time the update to `t` takes place.
- Row comparison operations are only partially supported:
  - For *`expr`* `IN (`*`subquery`*`)`, *`expr`* can be an *n*-tuple (specified using row constructor syntax) and the subquery can return rows of *n*-tuples.
  - For *`expr`* *`op`* `{ALL|ANY|SOME} (`*`subquery`*`)`, *`expr`* must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

  In other words, for a subquery that returns rows of *n*-tuples, this is supported:

  ```
  (val_1, ..., val_n) IN (subquery)
  ```

  But this is not supported:

  ```
  (val_1, ..., val_n) op {ALL|ANY|SOME} (subquery)
  ```

  The reason for supporting row comparisons for `IN` but not for the others is that `IN` is implemented by rewriting it as a sequence of `=` comparisons and `AND` operations. This approach cannot be used for `ALL`, `ANY`, or `SOME`.
- Subqueries in the `FROM` clause cannot be correlated subqueries. They are materialized in whole (evaluated to produce a result set) before evaluating the outer query, so they cannot be evaluated per row of the outer query.
- MySQL does not support `LIMIT` in subqueries for certain subquery operators:

  ```
  mysql> SELECT * FROM t1
      ->   WHERE s1 IN (SELECT s2 FROM t2 ORDER BY s1 LIMIT 1);
  ERROR 1235 (42000): This version of MySQL doesn't yet support
   'LIMIT & IN/ALL/ANY/SOME subquery'
  ```
- The optimizer is more mature for joins than for subqueries, so in many cases a statement that uses a subquery can be executed more efficiently if you rewrite it as a join.

  An exception occurs for the case where an `IN` subquery can be rewritten as a `SELECT DISTINCT` join. Example:

```
SELECT col FROM t1 WHERE id_col IN (SELECT id_col2 FROM t2 WHERE condition);
```

That statement can be rewritten as follows:

```
SELECT DISTINCT col FROM t1, t2 WHERE t1.id_col = t2.id_col AND condition;
```

But in this case, the join requires an extra `DISTINCT` operation and is not more efficient than the subquery.

- MySQL permits a subquery to refer to a stored function that has data-modifying side effects such as inserting rows into a table. For example, if `f()` inserts rows, the following query can modify data:

```
SELECT ... WHERE x IN (SELECT f() ...);
```

This behavior is nonstandard (not permitted by the SQL standard). In MySQL, it can produce indeterminate results because `f()` might be executed a different number of times for different executions of a given query depending on how the optimizer chooses to handle it.

For statement-based or mixed-format replication, one implication of this indeterminism is that such a query can produce different results on the master and its slaves.

- Possible future optimization: A subquery in the `FROM` clause is evaluated by materializing the result into a temporary table, and this table does not use indexes. This does not allow the use of indexes in comparison with other tables in the query, although that might be useful.

- Possible future optimization: MySQL does not rewrite the join order for subquery evaluation. In some cases, a subquery could be executed more efficiently if MySQL rewrote it as a join. This would give the optimizer a chance to choose between more execution plans. For example, it could decide whether to read one table or the other first.

  Example:

```
SELECT a FROM outer_table AS ot
WHERE a IN (SELECT a FROM inner_table AS it WHERE ot.b = it.b);
```

For that query, MySQL always scans `outer_table` first and then executes the subquery on `inner_table` for each row. If `outer_table` has a lot of rows and `inner_table` has few rows, the query probably will not be as fast as it could be.

The preceding query could be rewritten like this:

```
SELECT a FROM outer_table AS ot, inner_table AS it
WHERE ot.a = it.a AND ot.b = it.b;
```

In this case, we can scan the small table (`inner_table`) and look up rows in `outer_table`, which will be fast if there is an index on `(ot.a,ot.b)`.

- Possible future optimization: A correlated subquery is evaluated for each row of the outer query. A better approach is that if the outer row values do not change from the previous row, do not evaluate the subquery again. Instead, use its previous result.

- Possible future optimization: If a subquery in the `FROM` clause resembles a view to which the merge algorithm can be applied, rewrite the query and apply the merge algorithm so that indexes can be used. The following statement contains such a subquery:

```
SELECT * FROM (SELECT * FROM t1 WHERE t1.t1_col)
         AS _t1, t2 WHERE t2.t2_col;
```

The statement can be rewritten as a join like this:

```
SELECT * FROM t1, t2 WHERE t1.t1_col AND t2.t2_col;
```

This type of rewriting would provide two benefits:

  - It avoids the use of a temporary table for which no indexes can be used. In the rewritten query, the optimizer can use indexes on `t1`.

  - It gives the optimizer more freedom to choose between different execution plans. For example, rewriting the query as a join enables the optimizer to use `t1` or `t2` first.

- Possible future optimization: For `IN`, `= ANY`, `<> ANY`, `= ALL`, and `<> ALL` with uncorrelated subqueries, use an in-memory hash for a result or a temporary table with an index for larger results. Example:

```
SELECT a FROM big_table AS bt
WHERE non_key_field IN (SELECT non_key_field FROM table WHERE condition)
```

In this case, we could create a temporary table:

```
CREATE TABLE t (key (non_key_field))
(SELECT non_key_field FROM table WHERE condition)
```

Then, for each row in `big_table`, do a key lookup in `t` based on `bt.non_key_field`.

E.5. Restrictions on Views

View processing is not optimized:

- It is not possible to create an index on a view.
- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

Subqueries cannot be used in the `FROM` clause of a view.

There is a general principle that you cannot modify a table and select from the same table in a subquery. See Section E.4, “Restrictions on Subqueries”.

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);

UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case the view will be stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it “at the same time.” (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying `ALGORITHM = TEMPTABLE` in the view definition.)

You can use `DROP TABLE` or `ALTER TABLE` to drop or alter a table that is used in a view definition. No warning results from the `DROP` or `ALTER` operation, even though this invalidates the view. Instead, an error occurs later, when the view is used. `CHECK TABLE` can be used to check for views that have been invalidated by `DROP` or `ALTER` operations.

A view definition is “frozen” by certain statements:

- If a statement prepared by `PREPARE` refers to a view, the view definition seen each time the statement is executed later will be the definition of the view at the time it was prepared. This is true even if the view definition is changed after the statement is prepared and before it is executed. Example:

  ```
  CREATE VIEW v AS SELECT RAND();
  PREPARE s FROM 'SELECT * FROM v';
  ALTER VIEW v AS SELECT NOW();
  EXECUTE s;
  ```

  The result returned by the `EXECUTE` statement is a random number, not the current date and time.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. This includes views that have `UNION` in their definition. Currently, not all views that are theoretically updatable can be updated. The initial view implementation was deliberately written this way to get usable, updatable views into MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist:

- Updatable views with subqueries anywhere other than in the `WHERE` clause. Some views that have subqueries in the `SELECT` list may be updatable.
- You cannot use `UPDATE` to update more than one underlying table of a view that is defined as a join.

- You cannot use `DELETE` to update a view that is defined as a join.

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the `CREATE VIEW` and `SELECT` privileges), that user will be unable to call `SHOW CREATE VIEW` on that object unless the user is also granted the `SHOW VIEW` privilege.

That shortcoming can lead to problems backing up a database with `mysqldump`, which may fail due to insufficient privileges. This problem is described in Bug #22062.

The workaround to the problem is for the administrator to manually grant the `SHOW VIEW` privilege to users who are granted `CREATE VIEW`, since MySQL doesn't grant it implicitly when views are created.

Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is not permitted.

`SHOW CREATE VIEW` displays view definitions using an `AS alias_name` clause for each column. If a column is created from an expression, the default alias is the expression text, which can be quite long. Aliases for column names in `CREATE VIEW` statements are checked against the maximum column length of 64 characters (not the maximum alias length of 256 characters). As a result, views created from the output of `SHOW CREATE VIEW` fail if any column alias exceeds 64 characters. This can cause problems in the following circumstances for views with too-long aliases:

- View definitions fail to replicate to newer slaves that enforce the column-length restriction.
- Dump files created with `mysqldump` cannot be loaded into servers that enforce the column-length restriction.

A workaround for either problem is the modify each problematic view definition to use aliases that provide shorter column names. Then the view will replicate properly, and can be dumped and reloaded without causing an error. To modify the definition, drop and create the view again with `DROP VIEW` and `CREATE VIEW`, or replace the definition with `CREATE OR REPLACE VIEW`.

For problems that occur when reloading view definitions in dump files, another workaround is to edit the dump file to modify its `CREATE VIEW` statements. However, this does not change the original view definitions, which may cause problems for subsequent dump operations.

E.6. Restrictions on XA Transactions

XA transaction support is limited to the `InnoDB` storage engine.

For “external XA,” a MySQL server acts as a Resource Manager and client programs act as Transaction Managers. For “Internal XA”, storage engines within a MySQL server act as RMs, and the server itself acts as a TM. Internal XA support is limited by the capabilities of individual storage engines. Internal XA is required for handling XA transactions that involve more than one storage engine. The implementation of internal XA requires that a storage engine support two-phase commit at the table handler level, and currently this is true only for `InnoDB`.

For `XA START`, the `JOIN` and `RESUME` clauses are not supported.

For `XA END`, the `SUSPEND [FOR MIGRATE]` clause is not supported.

The requirement that the *`bqual`* part of the *`xid`* value be different for each XA transaction within a global transaction is a limitation of the current MySQL XA implementation. It is not part of the XA specification.

If an XA transaction has reached the `PREPARED` state and the MySQL server is killed (for example, with `kill -9` on Unix) or shuts down abnormally, the transaction can be continued after the server restarts. However, if the client reconnects and commits the transaction, the transaction will be absent from the binary log even though it has been committed. This means the data and the binary log have gone out of synchrony. An implication is that XA cannot be used safely together with replication.

It is possible that the server will roll back a pending XA transaction, even one that has reached the `PREPARED` state. This happens if a client connection terminates and the server continues to run, or if clients are connected and the server shuts down gracefully. (In the latter case, the server marks each connection to be terminated, and then rolls back the `PREPARED` XA transaction associated with it.) It should be possible to commit or roll back a `PREPARED` XA transaction, but this cannot be done without changes to the binary logging mechanism.

E.7. Restrictions on Character Sets

- Identifiers are stored in `mysql` database tables (`user`, `db`, and so forth) using `utf8`, but identifiers can contain only characters in the Basic Multilingual Plane (BMP). Supplementary characters are not permitted in identifiers.
- The `ucs2`, `utf16`, and `utf32` character sets have the following restrictions:

  - They cannot be used as a client character set, which means that they do not work for `SET NAMES` or `SET CHARACTER SET`. (See Section 9.1.4, “Connection Character Sets and Collations”.)
  - It is currently not possible to use `LOAD DATA INFILE` to load data files that use these character sets.
  - `FULLTEXT` indexes cannot be created on a column that uses any of these character sets. However, you can perform `IN BOOLEAN MODE` searches on the column without an index.
  - The use of `ENCRYPT()` with these character sets is not recommended because the underlying system call expects a string terminated by a zero byte.
- The `REGEXP` and `RLIKE` operators work in byte-wise fashion, so they are not multi-byte safe and may produce unexpected results with multi-byte character sets. In addition, these operators compare characters by their byte values and accented characters may not compare as equal even if a given collation treats them as equal.

E.8. Restrictions on Performance Schema

The Performance Schema avoids using mutexes to collect or produce data, so there are no guarantees of consistency and results can sometimes be incorrect. Event values in `performance_schema` tables are nondeterministic and nonrepeatable.

If you save event information in another table, you should not assume that the original events will still be available later. For example, if you select events from a `performance_schema` table into a temporary table, intending to join that table with the original table later, there might be no matches.

`mysqldump` and `BACKUP DATABASE` ignore tables in the `performance_schema` database.

Tables in the `performance_schema` database cannot be locked with `LOCK TABLES`, except the `SETUP_xxx` tables.

Tables in the `performance_schema` database cannot be indexed.

Results for queries that refer to tables in the `performance_schema` database are not saved in the query cache.

Tables in the `performance_schema` database are not replicated.

The Performance Schema is not available in `libmysqld`, the embedded server.

The types of timers might vary per platform. The `performance_timers` table shows which event timers are available. If the values in this table for a given timer name are `NULL`, that timer is not supported on your platform.

Instruments that apply to storage engines might not be implemented for all storage engines. Instrumentation of each third-party engine is the responsibility of the engine maintainer.

E.9. Restrictions on Pluggable Authentication

The first part of this section describes general restrictions on the applicability of the pluggable authentication framework described at Section 5.5.6, “Pluggable Authentication”. The second part describes how third-party connector developers can determine the extent to which a connector can take advantage of pluggable authentication capabilities and what steps to take to become more compliant.

The term “native authentication” used here refers to authentication against passwords stored in the `Password` column of the `mysql.user` table. This is the same authentication method provided by MySQL servers older than 5.5.7, before pluggable authentication was implemented. It remains the default method in 5.5.7 and up, although now it is implemented using plugins. “Windows native authentication” refers to authentication using the credentials of a user who has already logged in to Windows, as implemented by the Windows Native Authentication plugin (“Windows plugin” for short).

General Pluggable Authentication Restrictions

- **Connector/C, Connector/C++:** Clients that use these connectors can connect to the server only through accounts that use native authentication.

  Exception: A connector supports pluggable authentication if it was built to link to `libmysql` dynamically (rather than statically) and it loads the current version of `libmysql` if that version is installed, or if the connector is recompiled from source to link against the current `libmysql`.
- **Connector/J:** Clients that use this connector can connect to the server only through accounts that use native authentication.

- **Connector/Net:** Before Connector/Net 6.4.4, clients that use this connector can connect to the server only through accounts that use native authentication. As of 6.4.4, clients can also connect to the server through accounts that use the Windows plugin.
- **Connector/ODBC:** Before Connector/ODBC 3.51.29 and 5.1.9, clients that use this connector can connect to the server only through accounts that use native authentication. As of 3.51.29 and 5.1.9, clients that use binary releases of this connector for Windows can also connect to the server through accounts that use the PAM or Windows plugins. (These capabilities result from linking the Connector/ODBC binaries against the MySQL 5.5.16 `libmysql` rather than the MySQL 5.1 `libmysql` used previously. The newer `libmysql` includes the client-side support needed for the server-side PAM and Windows authentication plugins.)
- **Connector/PHP:** Clients that use this connector can connect to the server only through accounts that use native authentication, when compiled using the MySQL native driver for PHP (`mysqlnd`).
- **MySQL Proxy:** Before MySQL Proxy 0.8.2, clients can connect to the server only through accounts that use native authentication. As of 0.8.2, clients can also connect to the server through accounts that use the PAM plugin. As of 0.8.3, clients can also connect to the server through accounts that use the Windows plugin.
- **MySQL Enterprise Backup:** MySQL Enterprise Backup before version 3.6.1 supports connections to the server only though accounts that use native authentication. As of 3.6.1, MySQL Enterprise Backup can connect to the server through accounts that use nonnative authentication.
- **Windows native authentication:** Connecting through an account that uses the Windows plugin requires Windows Domain setup. Without it, NTLM authentication is used and then only local connections are possible; that is, the client and server must run on the same computer.
- **Proxy users:** Proxy user support is available to the extent that clients can connect through accounts authenticated with plugins that implement proxy user capability (that is, plugins that can return a user name different from that of the connecting user). For example, the native authentication plugins do not support proxy users, whereas the PAM and Windows plugins do.
- **Replication:** Before MySQL 5.5.17, replication slaves can connect to the master server only through master accounts that use native authentication. As of 5.5.17 (or 5.5.19 for Windows native authentication), replication slaves can also connect through master accounts that use nonnative authentication if the required client-side plugin is available. If the plugin is built into `libmysql`, it is available by default. Otherwise, the plugin must be installed on the slave side in the directory named by the slave `plugin_dir` system variable.
- **`FEDERATED` tables:** A `FEDERATED` table can access the remote table only through accounts on the remote server that use native authentication.

Pluggable Authentication and Third-Party Connectors

Third-party connector developers can use the following guidelines to determine readiness of a connector to take advantage of pluggable authentication capabilities and what steps to take to become more compliant:

- An existing connector to which no changes have been made uses native authentication and clients that use the connector can connect to the server only through accounts that use native authentication. *However, you should test the connector against a recent version of the server to verify that such connections still work without problem.*

  Exception: A connector might work with pluggable authentication without any changes if it links to `libmysql` dynamically (rather than statically) and it loads the current version of `libmysql` if that version is installed.
- To take advantage of pluggable authentication capabilities, a connector that is `libmysql`-based should be relinked against the current version of `libmysql`. This enables the connector to support connections though accounts that require client-side plugins now built into `libmysql` (such as the clear-text plugin needed for PAM authentication and the Windows plugin needed for Windows native authentication). Linking with a current `libmysql` also enables the connector to access client-side plugins installed in the default MySQL plugin directory (typically the directory named by the default value of the local server's `plugin_dir` system variable).

  If a connector links to `libmysql` dynamically, it must be ensured that the newer version of `libmysql` is installed on the client host and that the connector loads it at runtime.
- Another way for a connector to support a given authentication method is to implement it directly in the client/server protocol. Connector/Net uses this approach to provide support for Windows native authentication.
- If a connector should be able to load client-side plugins from a directory different from the default plugin directory, it must implement some means for client users to specify the directory. Possibilities for this include a command-line option or environment variable from which the connector can obtain the directory name. Standard MySQL client programs such as `mysql` and `mysqladmin` implement a `--plugin-dir` option. See also Section 21.9.10, “C API Client Plugin Functions”.

- Proxy user support by a connector depends, as described earlier in this section, on whether the authentication methods that it supports permit proxy users.

E.10. Limits in MySQL

This section lists current limits in MySQL 5.5.

E.10.1. Limits of Joins

The maximum number of tables that can be referenced in a single join is 61. This also applies to the number of tables that can be referenced in the definition of a view.

E.10.2. Limits on Number of Databases and Tables

MySQL has no limit on the number of databases. The underlying file system may have a limit on the number of directories.

MySQL has no limit on the number of tables. The underlying file system may have a limit on the number of files that represent tables. Individual storage engines may impose engine-specific constraints. `InnoDB` permits up to 4 billion tables.

E.10.3. Limits on Table Size

The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. The following table lists some examples of operating system file-size limits. This is only a rough guide and is not intended to be definitive. For the most up-to-date information, be sure to check the documentation specific to your operating system.

Operating System	File-size Limit
Win32 w/ FAT/FAT32	2GB/4GB
Win32 w/ NTFS	2TB (possibly larger)
Linux 2.2-Intel 32-bit	2GB (LFS: 4GB)
Linux 2.4+	(using ext3 file system) 4TB
Solaris 9/10	16TB
MacOS X w/ HFS+	2TB

Windows users, please note that FAT and VFAT (FAT32) are *not* considered suitable for production use with MySQL. Use NTFS instead.

On Linux 2.2, you can get `MyISAM` tables larger than 2GB in size by using the Large File Support (LFS) patch for the ext2 file system. Most current Linux distributions are based on kernel 2.4 or higher and include all the required LFS patches. On Linux 2.4, patches also exist for ReiserFS to get support for big files (up to 2TB). With JFS and XFS, petabyte and larger files are possible on Linux.

For a detailed overview about LFS in Linux, have a look at Andreas Jaeger's *Large File Support in Linux* page at http://www.suse.de/~aj/linux_lfs.html.

If you do encounter a full-table error, there are several reasons why it might have occurred:

- The disk might be full.
- The `InnoDB` storage engine maintains `InnoDB` tables within a tablespace that can be created from several files. This enables a table to exceed the maximum individual file size. The tablespace can include raw disk partitions, which permits extremely large tables. The maximum tablespace size is 64TB.

  If you are using `InnoDB` tables and run out of room in the `InnoDB` tablespace. In this case, the solution is to extend the `InnoDB` tablespace. See Section 13.3.6, “Adding, Removing, or Resizing `InnoDB` Data and Log Files”.
- You are using `MyISAM` tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.
- You are using a `MyISAM` table and the space required for the table exceeds what is permitted by the internal pointer size. `MyISAM` permits data and index files to grow up to 256TB by default, but this limit can be changed up to the maximum permissible size of 65,536TB ($256^7 - 1$ bytes).

If you need a MyISAM table that is larger than the default limit and your operating system supports large files, the CREATE TABLE statement supports AVG_ROW_LENGTH and MAX_ROWS options. See Section 12.1.17, “CREATE TABLE Syntax”. The server uses these options to determine how large a table to permit.

If the pointer size is too small for an existing table, you can change the options with ALTER TABLE to increase a table's maximum permissible size. See Section 12.1.7, “ALTER TABLE Syntax”.

```
ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
```

You have to specify AVG_ROW_LENGTH only for tables with BLOB or TEXT columns; in this case, MySQL can't optimize the space required based only on the number of rows.

To change the default size limit for MyISAM tables, set the myisam_data_pointer_size, which sets the number of bytes used for internal row pointers. The value is used to set the pointer size for new tables if you do not specify the MAX_ROWS option. The value of myisam_data_pointer_size can be from 2 to 7. A value of 4 permits tables up to 4GB; a value of 6 permits tables up to 256TB.

You can check the maximum data and index sizes by using this statement:

```
SHOW TABLE STATUS FROM db_name LIKE 'tbl_name';
```

You also can use myisamchk -dv /path/to/table-index-file. See Section 12.7.5, “SHOW Syntax”, or Section 4.6.3, “myisamchk — MyISAM Table-Maintenance Utility”.

Other ways to work around file-size limits for MyISAM tables are as follows:

- If your large table is read only, you can use myisampack to compress it. myisampack usually compresses a table by at least 50%, so you can have, in effect, much bigger tables. myisampack also can merge multiple tables into a single table. See Section 4.6.5, “myisampack — Generate Compressed, Read-Only MyISAM Tables”.
- MySQL includes a MERGE library that enables you to handle a collection of MyISAM tables that have identical structure as a single MERGE table. See Section 13.10, “The MERGE Storage Engine”.

- You are using the NDB storage engine, in which case you need to increase the values for the DataMemory and IndexMemory configuration parameters in your config.ini file. See Section 16.3.3.1, “MySQL Cluster Data Node Configuration Parameters”.
- You are using the MEMORY (HEAP) storage engine; in this case you need to increase the value of the max_heap_table_size system variable. See Section 5.1.3, “Server System Variables”.

E.10.4. Table Column-Count and Row-Size Limits

There is a hard limit of 4096 columns per table, but the effective maximum may be less for a given table. The exact limit depends on several interacting factors.

- Every table (regardless of storage engine) has a maximum row size of 65,535 bytes. Storage engines may place additional constraints on this limit, reducing the effective maximum row size.

  The maximum row size constrains the number (and possibly size) of columns because the total length of all columns cannot exceed this size. For example, utf8 characters require up to three bytes per character, so for a CHAR(255) CHARACTER SET utf8 column, the server must allocate 255 × 3 = 765 bytes per value. Consequently, a table cannot contain more than 65,535 / 765 = 85 such columns.

  Storage for variable-length columns includes length bytes, which are assessed against the row size. For example, a VARCHAR(255) CHARACTER SET utf8 column takes two bytes to store the length of the value, so each value can take up to 767 bytes.

  BLOB and TEXT columns count from one to four plus eight bytes each toward the row-size limit because their contents are stored separately from the rest of the row.

  Declaring columns NULL can reduce the maximum number of columns permitted. For MyISAM tables, NULL columns require additional space in the row to record whether their values are NULL. Each NULL column takes one bit extra, rounded up to the nearest byte. The maximum row length in bytes can be calculated as follows:

```
row length = 1
             + (sum of column lengths)
             + (number of NULL columns + delete_flag + 7)/8
             + (number of variable-length columns)
```

delete_flag is 1 for tables with static row format. Static tables use a bit in the row record for a flag that indicates whether the row has been deleted. *delete_flag* is 0 for dynamic tables because the flag is stored in the dynamic row header. For information about MyISAM table formats, see Section 13.5.3, “MyISAM Table Storage Formats”.

These calculations do not apply for InnoDB tables. Storage size is the same for NULL and NOT NULL columns.

The following statement to create table t1 succeeds because the columns require 32,765 + 2 bytes and 32,766 + 2 bytes, which falls within the maximum row size of 65,535 bytes:

```
mysql> CREATE TABLE t1
    -> (c1 VARCHAR(32765) NOT NULL, c2 VARCHAR(32766) NOT NULL)
    -> ENGINE = MyISAM CHARACTER SET latin1;
Query OK, 0 rows affected (0.02 sec)
```

The following statement to create table t2 fails because the columns are NULL and MyISAM requires additional space that causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t2
    -> (c1 VARCHAR(32765) NULL, c2 VARCHAR(32766) NULL)
    -> ENGINE = MyISAM CHARACTER SET latin1;
ERROR 1118 (42000): Row size too large. The maximum row size for the
used table type, not counting BLOBs, is 65535. You have to change some
columns to TEXT or BLOBs
```

The following statement to create table t3 fails because although the column length is within the maximum length of 65,535 bytes, two additional bytes are required to record the length, which causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t3
    -> (c1 VARCHAR(65535) NOT NULL)
    -> ENGINE = MyISAM CHARACTER SET latin1;
ERROR 1118 (42000): Row size too large. The maximum row size for the
used table type, not counting BLOBs, is 65535. You have to change some
columns to TEXT or BLOBs
```

Reducing the column length to 65,533 or less permits the statement to succeed.

- Each table has an .frm file that contains the table definition. The server uses the following expression to check some of the table information stored in the file against an upper limit of 64KB:

```
if (info_length+(ulong) create_fields.elements*FCOMP+288+
    n_length+int_length+com_length > 65535L || int_count > 255)
```

The portion of the information stored in the .frm file that is checked against the expression cannot grow beyond the 64KB limit, so if the table definition reaches this size, no more columns can be added.

The relevant factors in the expression are:

  - info_length is space needed for “screens.” This is related to MySQL's Unireg heritage.
  - create_fields.elements is the number of columns.
  - FCOMP is 17.
  - n_length is the total length of all column names, including one byte per name as a separator.
  - int_length is related to the list of values for ENUM and SET columns.
  - com_length is the total length of column and table comments.

  Thus, using long column names can reduce the maximum number of columns, as can the inclusion of ENUM or SET columns, or use of column, index, or table comments.

- Individual storage engines might impose additional restrictions that limit table column count. Examples:

  - InnoDB permits up to 1000 columns.
  - InnoDB restricts row size to something less than half a database page (approximately 8000 bytes), not including VARBINARY, VARCHAR, BLOB, or TEXT columns.
  - Different InnoDB storage formats (COMPRESSED, REDUNDANT) use different amounts of page header and trailer data, which affects the amount of storage available for rows.

E.10.5. Windows Platform Limitations

The following limitations apply to use of MySQL on the Windows platform:

- **Process memory**

  On Windows 32-bit platforms, it is not possible by default to use more than 2GB of RAM within a single process, including MySQL. This is because the physical address limit on Windows 32-bit is 4GB and the default setting within Windows is to split the virtual address space between kernel (2GB) and user/applications (2GB).

  Some versions of Windows have a boot time setting to enable larger applications by reducing the kernel application. Alternatively, to use more than 2GB, use a 64-bit version of Windows.

- **File system aliases**

  When using `MyISAM` tables, you cannot use aliases within Windows link to the data files on another volume and then link back to the main MySQL `datadir` location.

  This facility is often used to move the data and index files to a RAID or other fast solution, while retaining the main `.frm` files in the default data directory configured with the `datadir` option.

- **Limited number of ports**

  Windows systems have about 4,000 ports available for client connections, and after a connection on a port closes, it takes two to four minutes before the port can be reused. In situations where clients connect to and disconnect from the server at a high rate, it is possible for all available ports to be used up before closed ports become available again. If this happens, the MySQL server appears to be unresponsive even though it is running. Note that ports may be used by other applications running on the machine as well, in which case the number of ports available to MySQL is lower.

  For more information about this problem, see http://support.microsoft.com/default.aspx?scid=kb;en-us;196271.

- **`DATA DIRECTORY` and `INDEX DIRECTORY`**

  The `DATA DIRECTORY` and `INDEX DIRECTORY` options for `CREATE TABLE` are ignored on Windows, because MySQL does not support Windows symbolic links. These options also are ignored on systems that have a nonfunctional `realpath()` call.

- **`DROP DATABASE`**

  You cannot drop a database that is in use by another session.

- **Case-insensitive names**

  File names are not case sensitive on Windows, so MySQL database and table names are also not case sensitive on Windows. The only restriction is that database and table names must be specified using the same case throughout a given statement. See Section 8.2.2, “Identifier Case Sensitivity”.

- **Directory and file names**

  On Windows, MySQL Server supports only directory and file names that are compatible with the current ANSI code pages. For example, the following Japanese directory name will not work in the Western locale (code page 1252):

  ```
  datadir="C:/私たちのプロジェクトのデータ"
  ```

  The same limitation applies to directory and file names referred to in SQL statements, such as the data file path name in `LOAD DATA INFILE`.

- **The “`\`” path name separator character**

  Path name components in Windows are separated by the “`\`” character, which is also the escape character in MySQL. If you are using `LOAD DATA INFILE` or `SELECT ... INTO OUTFILE`, use Unix-style file names with “`/`” characters:

  ```
  mysql> LOAD DATA INFILE 'C:/tmp/skr.txt' INTO TABLE skr;
  mysql> SELECT * INTO OUTFILE 'C:/tmp/skr.txt' FROM skr;
  ```

  Alternatively, you must double the “`\`” character:

  ```
  mysql> LOAD DATA INFILE 'C:\\tmp\\skr.txt' INTO TABLE skr;
  mysql> SELECT * INTO OUTFILE 'C:\\tmp\\skr.txt' FROM skr;
  ```

- **Problems with pipes**

  Pipes do not work reliably from the Windows command-line prompt. If the pipe includes the character `^Z` / `CHAR(24)`, Windows thinks that it has encountered end-of-file and aborts the program.

  This is mainly a problem when you try to apply a binary log as follows:

  ```
  C:\> mysqlbinlog binary_log_file | mysql --user=root
  ```

  If you have a problem applying the log and suspect that it is because of a `^Z` / `CHAR(24)` character, you can use the following workaround:

  ```
  C:\> mysqlbinlog binary_log_file --result-file=/tmp/bin.sql
  C:\> mysql --user=root --execute "source /tmp/bin.sql"
  ```

  The latter command also can be used to reliably read in any SQL file that may contain binary data.

Appendix F. MySQL Glossary

These terms are commonly used in information about the MySQL database server. This glossary originated as a reference for terminology about the InnoDB storage engine, and the majority of definitions are InnoDB-related.

A

ACID

An acronym standing for atomicity, consistency, isolation, and durability. These properties are all desirable in a database system, and are all closely tied to the notion of a **transaction**. The transactional features of InnoDB adhere to the ACID principles.

Transactions are atomic units of work that can be committed or rolled back. When a transaction makes multiple changes to the database, either all the changes succeed when the transaction is committed, or all the changes are undone when the transaction is rolled back.

The database remains in a consistent state at all times -- after each commit or rollback, and while transactions are in progress.

Transactions are protected (isolated) from each other while they are in progress; they cannot interfere with each other or see each other's uncommitted data. This isolation is achieved through the notion of **locking**. (Expert users can adjust the **isolation level**, trading off less protection in favor of increased performance, when they can be sure that the transactions really do not interfere with each other.)

The results of transactions are durable: once a commit operation succeeds, the changes made by that transaction are safe from power failures, system crashes, race conditions, or other potential dangers that many non-database applications are vulnerable to. Durability typically involves writing to disk storage, with a certain amount of redundancy to protect against power failures or software crashes during write operations. (In InnoDB, the **doublewrite buffer** assists with durability.)

See also commit.

See also doublewrite buffer.

See also isolation level.

See also locking.

See also rollback.

See also transaction.

adaptive flushing

An algorithm, first introduced in the **InnoDB Plugin**, that smooths out the I/O overhead introduced by **checkpoints**. Instead of **flushing** all modified pages from the **buffer pool** to the **data files** at once, the InnoDB storage engine periodically flushes small sets of modified pages. The adaptive flushing algorithm extends this process by estimating the optimal rate to perform these periodic flushes, based on the rate of flushing and how fast **redo** information is generated.

See also buffer pool.

See also checkpoint.

See also data files.

See also flush.

See also plugin.

See also redo log.

adaptive hash index

If a table fits almost entirely in main memory, the fastest way to perform queries on it is to use **hash indexes**. InnoDB has a mechanism that monitors index searches made to the indexes defined for a table. If InnoDB notices that queries could benefit from a hash index, it builds one automatically. This feature is controlled by the `innodb_adaptive_hash_index` configuration option.

The hash index is always built based on an existing **B-tree** index on the table. InnoDB can

build a hash index on a prefix of any length of the key defined for the B-tree, depending on the pattern of searches that InnoDB observes for the B-tree index. A hash index can be partial; the whole B-tree index does not need to be cached in the buffer pool. InnoDB builds hash indexes on demand for those pages of the index that are often accessed.

In a sense, the adaptive hash index configures InnoDB at runtime to take advantage of ample main memory, coming closer to the architecture of main-memory databases.

See also B-tree.

See also hash index.

AIO

Acronym for **asynchronous I/O**. You might see this acronym in InnoDB messages or keywords.

See also asynchronous I/O.

Antelope

The code name for the original InnoDB **file format**. It supports the **redundant** and **compact** row formats, but not the newer **dynamic** and **compressed** row formats available in the **Barracuda** file format.

If your application could benefit from InnoDB table **compression**, or uses BLOBs or large text columns that could benefit from the dynamic row format, you might switch some tables to Barracuda format. You select the file format to use by setting the `innodb_file_format` option before creating the table.

See also Barracuda.

See also compact row format.

See also compressed row format.

See also dynamic row format.

See also file format.

See also innodb_file_format.

See also redundant row format.

application programming interface (API)

A set of functions or procedures. An API provides a stable set of names and types for functions, procedures, parameters, and return values.

apply

When a backup produced by the **MySQL Enterprise Backup** product does not include the most recent changes that occurred while the backup was underway, the process of updating the backup files to include those changes is known as the **apply** step. It is specified by the `apply-log` option of the `mysqlbackup` command.

Before the changes are applied, we refer to the files as a **raw backup**. After the changes are applied, we refer to the files as a **prepared backup**. The changes are recorded in the **ibbackup_logfile** file; once the apply step is finished, this file is no longer necessary.

See also hot backup.

See also ibbackup_logfile.

See also MySQL Enterprise Backup.

See also prepared backup.

See also raw backup.

.ARM file

Archive storage engine metadata. Files with this extension are always included in backups produced by the `mysqlbackup` command of the **MySQL Enterprise Backup** product.

See also .ARZ file.

See also MySQL Enterprise Backup.

See also mysqlbackup command.

.ARZ file

Archive storage engine data. Files with this extension are always included in backups produced by the `mysqlbackup` command of the **MySQL Enterprise Backup** product.

See also .ARM file.

See also MySQL Enterprise Backup.

See also mysqlbackup command.

asynchronous I/O

A type of I/O operation that allows other processing to proceed before the I/O is completed. Also known as **non-blocking I/O** and abbreviated as **AIO**. InnoDB uses this type of I/O for certain operations that can run in parallel without affecting the reliability of the database, such as reading pages into the **buffer pool** that have not actually been requested, but might be needed soon.

Historically, InnoDB has used asynchronous I/O on Windows systems only. Starting with the InnoDB Plugin 1.1, InnoDB uses asynchronous I/O on Linux systems. This change introduces a dependency on `libaio`. On other Unix-like systems, InnoDB uses synchronous I/O only.

See also buffer pool.

See also non-blocking I/O.

atomic

In the SQL context, **transactions** are units of work that either succeed entirely (when **committed**) or have no effect at all (when **rolled back**). The indivisible (“atomic”) property of transactions is the “A” in the acronym **ACID**.

See also ACID.

See also commit.

See also rollback.

See also transaction.

atomic instruction

Special instructions provided by the CPU, to ensure that critical low-level operations cannot be interrupted.

auto-increment

A property of a table column (specified by the `AUTO_INCREMENT` keyword) that automatically adds an ascending sequence of values in the column. InnoDB supports auto-increment only for **primary key** columns.

It saves work for the developer, not to have to produce new unique values when inserting new rows. It provides useful information for the query optimizer, because the column is known to be not null and with unique values. The values from such a column can be used as lookup keys in various contexts, and because they are auto-generated there is no reason to ever change them; for this reason, primary key columns are often specified as auto-incrementing.

Auto-increment columns can be problematic with statement-based replication, because replaying the statements on a slave might not produce the same set of column values as on the master, due to timing issues. When you have an auto-incrementing primary key, you can use statement-based replication only with the setting `innodb_autoinc_lock_mode=1`. If you have `innodb_autoinc_lock_mode=2`, which allows higher concurrency for insert operations, use **row-based replication** rather than **statement-based replication**. The setting `innodb_autoinc_lock_mode=0` is the previous (traditional) default setting and should not be used except for compatibility purposes.

See also auto-increment locking.

See also innodb_autoinc_lock_mode.

See also primary key.

See also row-based replication.

See also statement-based replication.

auto-increment locking

The convenience of an **auto-increment** primary key involves some tradeoff with concurrency. In the simplest case, if one transaction is inserting values into the table, any other

transactions must wait to do their own inserts into that table, so that rows inserted by the first transaction receive consecutive primary key values. InnoDB includes optimizations, and the `innodb_autoinc_lock_mode` option, so that you can choose how to trade off between predictable sequences of auto-increment values and maximum **concurrency** for insert operations.

See also auto-increment.

See also concurrency.

See also innodb_autoinc_lock_mode.

autocommit

A setting that causes a **commit** operation after each **SQL** statement. This mode is not recommended for working with InnoDB tables with **transactions** that span several statements. It can help performance for read-only queries on InnoDB tables, where it minimizes overhead from **locking** and generation of **undo** data, especially in MySQL 5.6.4 and up. It is also appropriate for working with MyISAM tables, where transactions are not applicable.

See also commit.

See also locking.

See also SQL.

See also transaction.

See also undo.

B

B-tree

A tree data structure that is popular for use in database indexes. The structure is kept sorted at all times, enabling fast lookup for exact matches (equals operator) and ranges (for example, greater than, less than, and `BETWEEN` operators). This type of index is available for most storage engines, such as InnoDB and MyISAM.

Because B-tree nodes can have many children, a B-tree is not the same as a binary tree, which is limited to 2 children per node.

Contrast with **hash index**, which is only available in the MEMORY storage engine. The MEMORY storage engine can also use B-tree indexes, and you should choose B-tree indexes for MEMORY tables if some queries use range operators.

See also hash index.

backticks

Identifiers within MySQL SQL statements must be quoted using the backtick character (`) if they contain special characters or reserved words. For example, to refer to a table named `FOO#BAR` or a column named `SELECT`, you would specify the identifiers as `` `FOO#BAR` `` and `` `SELECT` ``. Since the backticks provide an extra level of safety, they are used extensively in program-generated SQL statements, where the identifier names might not be known in advance.

Many other database systems use double quotation marks (") around such special names. For portability, you can enable `ANSI_QUOTES` mode in MySQL and use double quotation marks instead of backticks to qualify identifier names.

See also SQL.

backup

The process of copying some or all table data and metadata from a MySQL instance, for safekeeping. Can also refer to the set of copied files. This is a crucial task for DBAs. The reverse of this process is the **restore** operation.

With MySQL, **physical backups** are performed by the **MySQL Enterprise Backup** product, and **logical backups** are performed by the `mysqldump` command. These techniques have different characteristics in terms of size and representation of the backup data, and speed (especially speed of the restore operation).

Backups are further classified as **hot**, **warm**, or **cold** depending on how much they interfere with normal database operation. (Hot backups have the least interference, cold backups the most.)

See also cold backup.

See also hot backup.

See also logical backup.

See also MySQL Enterprise Backup.

See also mysqldump.

See also physical backup.

See also warm backup.

Barracuda

The code name for an InnoDB **file format** that supports compression for table data. This file format was first introduced in the InnoDB Plugin. It supports the **compressed** row format that enables InnoDB table compression, and the **dynamic** row format that improves the storage layout for BLOB and large text columns. You can select it through the `innodb_file_format` option.

Because the InnoDB **system tablespace** is stored in the original **Antelope** file format, to use the Barracuda file format you must also enable the **file-per-table** setting, which puts newly created tables in their own tablespaces separate from the system tablespace.

The **MySQL Enterprise Backup** product version 3.5 and above supports backing up tablespaces that use the Barracuda file format.

See also Antelope.

See also compact row format.

See also compressed row format.

See also dynamic row format.

See also file format.

See also file-per-table.

See also innodb_file_format.

See also MySQL Enterprise Backup.

See also row format.

See also system tablespace.

beta

An early stage in the life of a software product, when it is available only for evaluation, typically without a definite release number or a number less than 1. InnoDB does not use the beta designation, preferring an **early adopter** phase that can extend over several point releases, leading to a **GA** release.

See also early adopter.

See also GA.

binary log

A file containing a record of all statements that attempt to change table data. These statements can be replayed to bring slave servers up to date in a **replication** scenario, or to bring a database up to date after restoring table data from a backup. The binary logging feature can be turned on and off, although Oracle recommends always enabling it if you use replication or perform backups.

You can examine the contents of the binary log, or replay those statements during replication or recovery, by using the `mysqlbinlog` command. For full information about the binary log, see Section 5.2.4, “The Binary Log”. For MySQL configuration options related to the binary log, see Section 15.1.3.4, “Binary Log Options and Variables”.

For the **MySQL Enterprise Backup** product, the file name of the binary log and the current position within the file are important details. To record this information for the master server when taking a backup in a replication context, you can specify the `--slave-info` option.

Prior to MySQL 5.0, a similar capability was available, known as the update log. In MySQL 5.0

and higher, the binary log replaces the update log.

See also binlog.

See also MySQL Enterprise Backup.

See also replication.

binlog

An informal name for the **binary log** file. For example, you might see this abbreviation used in e-mail messages or forum discussions.

See also binary log.

blind query expansion

A special mode of **full-text search** enabled by the `WITH QUERY EXPANSION` clause. It performs the search twice, where the search phrase for the second search is the original search phrase concatenated with the few most highly relevant documents from the first search. This technique is mainly applicable for short search phrases, perhaps only a single word. It can uncover relevant matches where the precise search term does not occur in the document.

See also full-text search.

bottleneck

A portion of a system that is constrained in size or capacity, that has the effect of limiting overall throughput. For example, a memory area might be smaller than necessary; access to a single required resource might prevent multiple CPU cores from running simultaneously; or waiting for disk I/O to complete might prevent the CPU from running at full capacity. Removing bottlenecks tends to improve **concurrency**. For example, the ability to have multiple InnoDB **buffer pool** instances reduces contention when multiple sessions read from and write to the buffer pool simultaneously.

See also buffer pool.

See also concurrency.

bounce

A **shutdown** operation immediately followed by a restart. Ideally with a relatively short **warmup** period so that performance and throughput quickly return to a high level.

See also shutdown.

buddy allocator

A mechanism for managing different-sized **pages** in the InnoDB **buffer pool**.

See also buffer pool.

See also page.

See also page size.

buffer

A memory or disk area used for temporary storage. Data is buffered in memory so that it can be written to disk efficiently, with a few large I/O operations rather than many small ones. Data is buffered on disk for greater reliability, so that it can be recovered even when a crash or other failure occurs at the worst possible time. The main types of buffers used by InnoDB are the **buffer pool**, the **doublewrite buffer**, and the **insert buffer**.

See also buffer pool.

See also doublewrite buffer.

See also insert buffer.

buffer pool

The memory area that holds cached InnoDB data for both tables and indexes. For efficiency of high-volume read operations, the buffer pool is divided into **pages** that can potentially hold multiple rows. For efficiency of cache management, the buffer pool is implemented as a linked list of pages; data that is rarely used is aged out of the cache, using a variation of the **LRU** algorithm. On systems with large memory, you can improve concurrency by dividing the buffer pool into multiple **buffer pool instances**.

Several `InnoDB` status variables, `information_schema` tables, and `performance_schema` tables help to monitor the internal workings of the buffer pool. Starting in MySQL 5.6, you can also dump and restore the contents of the buffer pool, either automatically during shutdown and restart, or manually at any time, through a set of `InnoDB` configuration variables such as `innodb_buffer_pool_dump_at_shutdown` and `in-`

`nodb_buffer_pool_load_at_startup`.

See also buffer pool instance.

See also LRU.

See also page.

See also warm up.

buffer pool instance

Any of the multiple regions into which the **buffer pool** can be divided, controlled by the `innodb_buffer_pool_instances` configuration option. The total memory size specified by the `innodb_buffer_pool_size` is divided among all the instances. Typically, multiple buffer pool instances are appropriate for systems devoting multiple gigabytes to the InnoDB buffer pool, with each instance 1 gigabyte or larger. On systems loading or looking up large amounts of data in the buffer pool from many concurrent sessions, having multiple instances reduces the contention for exclusive access to the data structures that manage the buffer pool.

See also buffer pool.

built-in

The built-in InnoDB storage engine within MySQL is the original form of distribution for the storage engine. Contrast with the **InnoDB Plugin**. Starting with MySQL 5.5, the InnoDB Plugin is merged back into the MySQL code base as the built-in InnoDB storage engine (known as InnoDB 1.1).

This distinction is important mainly in MySQL 5.1, where a feature or bug fix might apply to the InnoDB Plugin but not the built-in InnoDB, or vice versa.

See also InnoDB.

See also plugin.

business rules

The relationships and sequences of actions that form the basis of business software, used to run a commercial company. Sometimes these rules are dictated by law, other times by company policy. Careful planning ensures that the relationships encoded and enforced by the database, and the actions performed through application logic, accurately reflect the real policies of the company and can handle real-life situations.

For example, an employee leaving a company might trigger a sequence of actions from the human resources department. The human resources database might also need the flexibility to represent data about a person who has been hired, but not yet started work. Closing an account at an online service might result in data being removed from a database, or the data might be moved or flagged so that it could be recovered if the account is re-opened. A company might establish policies regarding salary maximums, minimums, and adjustments, in addition to basic sanity checks such as the salary not being a negative number. A retail database might not allow a purchase with the same serial number to be returned more than once, or might not allow credit card purchases above a certain value, while a database used to detect fraud might allow these kinds of things.

See also relational.

C

cache

The general term for any memory area that stores copies of data for frequent or high-speed retrieval. In InnoDB, the primary kind of cache structure is the **buffer pool**.

See also buffer.

See also buffer pool.

cardinality

The number of different values in a table **column**. When queries refer to columns that have an associated **index**, the cardinality of each column influences which access method is most efficient. For example, for a column with a **unique constraint**, the number of different values is equal to the number of rows in the table. If a table has a million rows but only 10 different values for a particular column, each value occurs (on average) 100,000 times. A query such as `SELECT c1 FROM t1 WHERE c1 = 50;` thus might return 1 row or a huge number of rows, and the database server might process the query differently depending on the cardinality of `c1`.

If the values in a column have a very uneven distribution, the cardinality might not be a good way to determine the best query plan. For example, `SELECT c1 FROM t1 WHERE c1 = x;` might return 1 row when `x=50` and a million rows when `x=30`. In such a case, you might need to use **index hints** to pass along advice about which lookup method is more efficient for a particular query.

Cardinality can also apply to the number of distinct values present in multiple columns, as in a **composite index**.

For InnoDB, the process of estimating cardinality for indexes is influenced by the `innodb_stats_sample_pages` and the `innodb_stats_on_metadata` configuration options. The estimated values are more stable when the **persistent statistics** feature is enabled (in MySQL 5.6 and higher).

See also column.

See also composite index.

See also index.

See also index hint.

See also persistent statistics.

See also random dive.

See also selectivity.

See also unique constraint.

change buffer

A special data structure that records changes to **pages** in **secondary indexes**. These values could result from SQL `INSERT`, `UPDATE`, or `DELETE` statements (**DML**). The set of features involving the change buffer is known collectively as **change buffering**, consisting of **insert buffering**, **delete buffering**, and **purge buffering**.

Changes are only recorded in the change buffer when the relevant page from the secondary index is not in the **buffer pool**. When the relevant index page is brought into the buffer pool while associated changes are still in the change buffer, the changes for that page are applied in the buffer pool (**merged**) using the data from the change buffer. Periodically, the **purge** operation that runs during times when the system is mostly idle, or during a slow shutdown, writes the new index pages to disk. The purge operation can write the disk blocks for a series of index values more efficiently than if each value were written to disk immediately.

Physically, the change buffer is part of the **system tablespace**, so that the index changes remain buffered across database restarts. The changes are only applied (**merged**) when the pages are brought into the buffer pool due to some other read operation.

The amount and kind of data stored in the change buffer are governed by the `innodb_change_buffer_max_size` and `innodb_change_buffering` configuration options. To see information about the current data in the change buffer, issue the `SHOW ENGINE INNODB STATUS` command.

Formerly known as the **insert buffer**.

See also buffer pool.

See also change buffering.

See also delete buffering.

See also DML.

See also insert buffer.

See also insert buffering.

See also merge.

See also page.

See also purge.

See also purge buffering.

See also secondary index.

See also system tablespace.

change buffering

The general term for the features involving the **change buffer**, consisting of **insert buffering**, **delete buffering**, and **purge buffering**. Index changes resulting from SQL statements, which could normally involve random I/O operations, are held back and performed periodically by a background **thread**. This sequence of operations can write the disk blocks for a series of index values more efficiently than if each value were written to disk immediately.

See also change buffer.

See also delete buffering.

See also insert buffering.

See also purge buffering.

checkpoint

As changes are made to data pages that are cached in the **buffer pool**, those changes are written to the **data files** sometime later, a process known as **flushing**. The checkpoint is a record of the latest changes (represented by an **LSN** value) that have been successfully written to the data files.

See also buffer pool.

See also data files.

See also flush.

See also fuzzy checkpointing.

See also LSN.

checksum

In `InnoDB`, a validation mechanism to detect corruption when a **page** in a **tablespace** is read from disk into the InnoDB **buffer pool**. This feature is turned on and off by the `innodb_checksums` configuration option. In MySQL 5.6, you can enable a faster checksum algorithm by also specifying the configuration option `innodb_checksum_algorithm=crc32`.

The `innochecksum` command helps to diagnose corruption problems by testing the checksum values for a specified **tablespace** file while the MySQL server is shut down.

MySQL also uses checksums for replication purposes. For details, see the configuration options `binlog_checksum`, `master_verify_checksum`, and `slave_sql_verify_checksum`.

See also buffer pool.

See also page.

See also tablespace.

child table

In a **foreign key** relationship, a child table is one whose rows refer (or point) to rows in another table with an identical value for a specific column. The corresponding row in the **parent table** must exist before the row can be created in the child table. The values in the child table can prevent delete or update operations on the parent table, or can cause automatic deletion or updates in the child table, based on the `ON CASCADE` option used when creating the foreign key.

See also foreign key.

See also parent table.

clean shutdown

A **shutdown** that completes without errors and applies all changes to InnoDB tables before finishing, as opposed to a crash or a **fast shutdown**. Synonym for **slow shutdown**.

See also fast shutdown.

See also shutdown.

See also slow shutdown.

client

A type of program that sends requests to a server, and interprets or processes the results. The client software might run only some of the time (such as a mail or chat program), and might run interactively (such as the `mysql` command processor).

See also mysql.

See also server.

clustered index

The InnoDB term for a **primary key** index. InnoDB table storage is organized based on the values of the primary key columns, to speed up queries and sorts involving the primary key columns. For best performance, choose the primary key columns carefully based on the most performance-critical queries. Because modifying the columns of the clustered index is an expensive operation, choose primary columns that are rarely or never updated.

In the Oracle Database product, this type of table is known as an **index-organized table**.

See also index.

See also primary key.

See also secondary index.

cold backup

A **backup** taken while the database is shut down. For busy applications and web sites, this might not be practical, and you might prefer a **warm backup** or a **hot backup**.

See also backup.

See also hot backup.

See also warm backup.

column

A data item within a **row**, whose storage and semantics are defined by a data type. Each **table** and **index** is largely defined by the set of columns it contains.

Each column has a **cardinality** value. A column can be the **primary key** for its table, or part of the primary key. A column can be subject to a **unique constraint**, a **NOT NULL constraint**, or both. Values in different columns, even across different tables, can be linked by a **foreign key** relationship.

In discussions of MySQL internal operations, sometimes **field** is used as a synonym, while row is the preferred term when discussing **SQL**.

See also cardinality.

See also foreign key.

See also index.

See also primary key.

See also row.

See also SQL.

See also table.

See also unique constraint.

column index

An **index** on a single column.

See also composite index.

See also index.

column prefix

When an index is created with a length specification, such as `CREATE INDEX idx ON t1 (c1(N))`, only the first N characters of the column value are stored in the index. Keeping the index prefix small makes the index compact, and the memory and disk I/O savings help perform-

ance. (Although making the index prefix too small can hinder query optimization by making rows with different values appear to the query optimizer to be duplicates.)

For columns containing binary values or long text strings, where sorting is not a major consideration and storing the entire value in the index would waste space, the index automatically uses the first N (typically 768) characters of the value to do lookups and sorts.

See also index.

commit

A **SQL** statement that ends a **transaction**, making permanent any changes made by the transaction. It is the opposite of **rollback**, which undoes any changes made in the transaction.

InnoDB uses an **optimistic** mechanism for commits, so that changes can be written to the data files before the commit actually occurs. This technique makes the commit itself faster, with the tradeoff that more work is required in case of a rollback.

By default, MySQL uses the **autocommit** setting, which automatically issues a commit following each SQL statement.

See also autocommit.

See also optimistic.

See also rollback.

See also SQL.

See also transaction.

compact row format

The default InnoDB **row format** since MySQL 5.0.3. Available for tables that use the **Antelope file format**. It has a more compact representation for nulls and variable-length fields than the prior default (**redundant row format**).

Because of the **B-tree** indexes that make row lookups so fast in InnoDB, there is little if any performance benefit to keeping all rows the same size.

See also Antelope.

See also file format.

See also redundant row format.

See also row format.

composite index

An **index** that includes multiple columns.

See also index.

See also index prefix.

compressed backup

A set of files produced by the **MySQL Enterprise Backup** product, where each **tablespace** is compressed. The compressed files are renamed with a `.ibz` file extension.

Applying **compression** right at the start of the backup process helps to avoid storage overhead during the compression process, and to avoid network overhead when transferring the backup files to another server. The process of **applying** the **binary log** takes longer, and requires uncompressing the backup files.

See also apply.

See also binary log.

See also compression.

See also hot backup.

See also MySQL Enterprise Backup.

See also tablespace.

compressed row format

A **row format** introduced in the InnoDB Plugin, available as part of the **Barracuda file format**. Large fields are stored away from the page that holds the rest of the row data, as in dynamic row

format. Both index pages and the large fields are compressed, yielding memory and disk savings. Depending on the structure of the data, the decrease in memory and disk usage might or might not outweigh the performance overhead of uncompressing the data as it is used.

See also Barracuda.

See also dynamic row format.

See also file format.

See also row format.

compression

A feature with wide-ranging benefits from using less disk space, performing less I/O, and using less cache memory. InnoDB products include more than one feature related to compression: table data can be kept in a compressed format during database operation; data can be compressed as part of a backup operation with the **MySQL Enterprise Backup** product.

When InnoDB table data is compressed, the compression applies to the **table** itself, any associated **index** data, and the pages loaded into the **buffer pool**. Compression does not apply to pages in the **undo buffer**.

The table compression feature requires using MySQL 5.5 or higher, or the InnoDB Plugin in MySQL 5.1 or earlier, and creating the table using the **Barracuda** file format and **compressed row format**, with the **innodb_file_per_table** setting turned on.

The compression feature of the **MySQL Enterprise Backup** product makes a compressed copy of each tablespace, changing the extension from `.ibd` to `.ibz`. Compressing the backup data allows you to keep more backups on hand, and reduces the time to transfer backups to a different server. The data is uncompressed during the restore operation. When a compressed backup operation processes a table that is already compressed, it skips the compression step for that table, because compressing again would result in little or no space savings.

See also Barracuda.

See also buffer pool.

See also compressed row format.

See also hot backup.

See also index.

See also innodb_file_per_table.

See also plugin.

See also table.

See also undo buffer.

concatenated index

See composite index.

concurrency

The ability of multiple operations (in database terminology, **transactions**) to run simultaneously, without interfering with each other. Concurrency is also involved with performance, because ideally the protection for multiple simultaneous transactions works with a minimum of performance overhead, using efficient mechanisms for **locking**.

See also ACID.

See also locking.

See also transaction.

configuration file

The file that holds the **option** values used by MySQL at startup. Traditionally, on Linux and UNIX this file is named `my.cnf`, and on Windows it is named `my.ini`. You can set a number of options related to InnoDB under the `[mysqld]` section of the file.

When you use the **MySQL Enterprise Backup** product, you typically use two configuration files: one that specifies where the data comes from and how it is structured (which could be the original configuration file for your real server), and a stripped-down one containing only a small set of options that specify where the backup data goes and how it is structured. The configuration

files used with the **MySQL Enterprise Backup** product must contain certain options that are typically left out of regular configuration files, so you might need to add some options to your existing configuration file for use with **MySQL Enterprise Backup**.

See also my.cnf.

See also option file.

consistent read

A read operation that uses snapshot information to present query results based on a point in time, regardless of changes performed by other transactions running at the same time. If queried data has been changed by another transaction, the original data is reconstructed based on the contents of the **undo log**. This technique avoids some of the **locking** issues that can reduce **concurrency** by forcing transactions to wait for other transactions to finish.

With the **repeatable read** isolation level, the snapshot is based on the time when the first read operation is performed. With the **read committed** isolation level, the snapshot is reset to the time of each consistent read operation.

Consistent read is the default mode in which InnoDB processes `SELECT` statements in **READ COMMITTED** and **REPEATABLE READ** isolation levels. Because a consistent read does not set any locks on the tables it accesses, other sessions are free to modify those tables while a consistent read is being performed on the table.

For technical details about the applicable isolation levels, see Section 13.3.9.2, “Consistent Nonlocking Reads”.

See also ACID.

See also concurrency.

See also isolation level.

See also locking.

See also MVCC.

See also READ COMMITTED.

See also READ UNCOMMITTED.

See also REPEATABLE READ.

See also SERIALIZABLE.

See also transaction.

See also undo log.

constraint

An automatic test that can block database changes to prevent data from becoming inconsistent. (In computer science terms, a kind of assertion related to an invariant condition.) Constraints are a crucial component of the **ACID** philosophy, to maintain data consistency. Constraints supported by MySQL include **FOREIGN KEY constraints** and **unique constraints**.

See also ACID.

See also foreign key.

See also relational.

See also unique constraint.

counter

A value that is incremented by a particular kind of `InnoDB` operation. Useful for measuring how busy a server is, troubleshooting the sources of performance issues, and testing whether changes (for example, to configuration settings or indexes used by queries) have the desired low-level effects. Different kinds of counters are available through **performance_schema** tables and **information_schema** tables, particularly `information_schema.innodb_metrics`.

See also INFORMATION_SCHEMA.

See also metrics counter.

See also Performance Schema.

covering index

An **index** that includes all the columns retrieved by a query. Instead of using the index values as pointers to find the full table rows, the query returns values from the index structure, saving disk I/O. InnoDB can apply this optimization technique to more indexes than MyISAM can, because InnoDB **secondary indexes** also include the primary key columns. InnoDB cannot apply this technique for queries against tables modified by a transactions, until that transaction ends.

Any **column index** or **composite index** could act as a covering index, given the right query. Design your indexes and queries to take advantage of this optimization technique wherever possible.

See also column index.

See also composite index.

See also index.

See also secondary index.

crash recovery

The cleanup activities that occur when InnoDB is started again after a crash. Changes that were committed before the crash, but not yet written into the tablespace files, are reconstructed from the **doublewrite buffer**. When the database is shut down normally, this type of activity is performed during shutdown by the **purge** operation.

During normal operation, committed data can be stored in the insert buffer for a period of time before being written to the tablespace files. There is always a tradeoff between keeping the tablespace files up-to-date, which introduces performance overhead during normal operation, and buffering the data, which can make shutdown and crash recovery take longer.

See also doublewrite buffer.

See also insert buffer.

See also purge.

CRUD

Acronym for “create, read, update, delete”, a common sequence of operations in database applications. Often denotes a class of applications with relatively simple database usage (basic **DDL**, **DML** and **query** statements in **SQL**) that can be implemented quickly in any language.

See also DDL.

See also DML.

See also query.

See also SQL.

cursor

An internal data structure that is used to represent the result set of a **query**, or other operation that performs a search using an SQL `WHERE` clause. It works like an iterator in other high-level languages, producing each value from the result set as requested.

Although usually SQL handles the processing of cursors for you, you might delve into the inner workings when dealing with performance-critical code.

See also query.

D

data definition language

See DDL.

data dictionary

A set of tables, controlled by the InnoDB storage engine, that keeps track of InnoDB-related objects such as tables, indexes, and table columns. These tables are part of the InnoDB **system tablespace**.

Because the **MySQL Enterprise Backup** product always backs up the system tablespace, all backups include the contents of the data dictionary.

See also hot backup.

See also MySQL Enterprise Backup.

See also system tablespace.

data directory

The directory under which each MySQL **instance** keeps the **data files** for InnoDB and the directories representing individual databases. Controlled by the `datadir` configuration option.

See also data files.

See also instance.

data files

The files that physically contain the InnoDB table and index data. There can be a one-to-many relationship between data files and tables, as in the case of the **system tablespace**, which can hold multiple InnoDB tables as well as the **data dictionary**. There can also be a one-to-one relationship between data files and tables, as when the **file-per-table** setting is enabled, causing each newly created table to be stored in a separate **tablespace**.

See also data dictionary.

See also file-per-table.

See also system tablespace.

See also tablespace.

data manipulation language

See DML.

data warehouse

A database system or application that primarily runs large **queries**. The read-only or read-mostly data might be organized in **denormalized** form for query efficiency. Contrast with **OLTP**.

See also denormalized.

See also OLTP.

See also query.

database

Within the MySQL **data directory**, each database is represented by a separate directory. The InnoDB **system tablespace**, which can hold table data from multiple databases within a MySQL **instance**, is kept in its **data files** that reside outside the individual database directories. When **file-per-table** mode is enabled, the **.ibd files** representing individual InnoDB tables are stored inside the database directories.

For long-time MySQL users, a database is a familiar notion. Users coming from an Oracle Database background will find that the MySQL meaning of a database is closer to what Oracle Database calls a **schema**.

See also data files.

See also file-per-table.

See also .ibd file.

See also instance.

See also schema.

See also system tablespace.

DDL

Data definition language, a set of **SQL** statements for manipulating the database itself rather than individual table rows. Includes all forms of the `CREATE`, `ALTER`, and `DROP` statements. Also includes the `TRUNCATE` statement, because it works differently than a `DELETE FROM` *`table_name`* statement, even though the ultimate effect is similar.

DDL statements automatically **commit** the current **transaction**; they cannot be **rolled back**.

The InnoDB-related aspects of DDL include speed improvements for `CREATE INDEX` and

`DROP INDEX` statements, and the way the **file-per-table** setting affects the behavior of the `TRUNCATE TABLE` statement.

See also commit.

See also file-per-table.

See also rollback.

See also SQL.

See also transaction.

deadlock

A situation where different **transactions** are unable to proceed, because each holds a **lock** that the other needs. Because both transactions are waiting for a resource to become available, neither will ever release the locks it holds.

A deadlock can occur when the transactions lock rows in multiple tables (through statements such as `UPDATE` or `SELECT ... FOR UPDATE`), but in the opposite order. A deadlock can also occur when such statements lock ranges of index records and **gaps**, with each transaction acquiring some locks but not others due to a timing issue.

To reduce the possibility of deadlocks, use transactions rather than `LOCK TABLE` statements; keep transactions that insert or update data small enough that they do not stay open for long periods of time; when different transactions update multiple tables or large ranges of rows, use the same order of operations (such as `SELECT ... FOR UPDATE`) in each transaction; create indexes on the columns used in `SELECT ... FOR UPDATE` and `UPDATE ... WHERE` statements. The possibility of deadlocks is not affected by the **isolation level**, because the isolation level changes the behavior of read operations, while deadlocks occur because of write operations.

If a deadlock does occur, InnoDB detects the condition and **rolls back** one of the transactions (the **victim**). Thus, even if your application logic is perfectly correct, you must still handle the case where a transaction must be retried. To see the last deadlock in an InnoDB user transaction, use the command `SHOW ENGINE INNODB STATUS`. If frequent deadlocks highlight a problem with transaction structure or application error handling, run with the `innodb_print_all_deadlocks` setting enabled to print information about all deadlocks to the `mysqld` error log.

See also concurrency.

See also gap.

See also isolation level.

See also lock.

See also locking.

See also rollback.

See also transaction.

See also victim.

deadlock detection

A mechanism that automatically detects when a **deadlock** occurs, and automatically **rolls back** one of the **transactions** involved (the **victim**).

See also deadlock.

See also rollback.

See also transaction.

See also victim.

delete

When InnoDB processes a `DELETE` statement, the rows are immediately marked for deletion and no longer are returned by queries. The storage is reclaimed sometime later, during the periodic garbage collection known as the **purge** operation, performed by a separate thread. For removing large quantities of data, related operations with their own performance characteristics are **truncate** and **drop**.

See also drop.

See also purge.

See also truncate.

delete buffering

The technique of storing index changes due to `DELETE` operations in the **insert buffer** rather than writing them immediately, so that the physical writes can be performed to minimize random I/O. (Because delete operations are a two-step process, this operation buffers the write that normally marks an index record for deletion.) It is one of the types of **change buffering**; the others are **insert buffering** and **purge buffering**.

See also change buffering.

See also insert buffer.

See also insert buffering.

See also purge buffering.

denormalized

A data storage strategy that duplicates data across different tables, rather than linking the tables with **foreign keys** and **join** queries. Typically used in **data warehouse** applications, where the data is not updated after loading. In such applications, query performance is more important than making it simple to maintain consistent data during updates. Contrast with **normalized**.

See also normalized.

descending index

A type of index available with some database systems, where index storage is optimized to process `ORDER BY column DESC` clauses. Currently, although MySQL allows the `DESC` keyword in the `CREATE TABLE` statement, it does not use any special storage layout for the resulting index.

See also index.

dirty page

A **page** in the InnoDB **buffer pool** that has been updated in memory, where the changes are not yet written (**flushed**) to the data files.

See also buffer pool.

See also flush.

See also neighbor page.

See also page.

See also write combining.

dirty read

An operation that retrieves unreliable data, data that was updated by another transaction but not yet **committed**. It is only possible with the **isolation level** known as **read uncommitted**.

This kind of operation does not adhere to the **ACID** principle of database design. It is considered very risky, because the data could be **rolled back**, or updated further before being committed; then, the transaction doing the dirty read would be using data that was never confirmed as accurate.

Its polar opposite is **consistent read**, where InnoDB goes to great lengths to ensure that a transaction does not read information updated by another transaction, even if the other transaction commits in the meantime.

See also ACID.

See also commit.

See also consistent read.

See also isolation level.

See also READ COMMITTED.

See also READ UNCOMMITTED.

See also rollback.

disk-based

A kind of database that primarily organizes data on disk storage (hard drives or equivalent). Data is brought back and forth between disk and memory to be operated upon. It is the opposite of an **in-memory database**. Although InnoDB is disk-based, it also contains features such as **the buffer** pool, multiple buffer pool instances, and the **adaptive hash index** that allow certain kinds of workloads to work primarily from memory.

See also adaptive hash index.

See also buffer pool.

See also in-memory database.

disk-bound

A type of **workload** where the primary **bottleneck** is CPU operations in memory. Typically involves read-intensive operations where the results can all be cached in the **buffer pool**.

See also bottleneck.

See also buffer pool.

See also disk-bound.

See also workload.

disk-bound

A type of **workload** where the primary **bottleneck** is disk I/O. Typically involves frequent writes to disk, or random reads of more data than can fit into the **buffer pool**.

See also bottleneck.

See also buffer pool.

See also disk-bound.

See also workload.

DML

Data manipulation language, a set of **SQL** statements for performing insert, update, and delete operations. The `SELECT` statement is sometimes considered as a DML statement, because the `SELECT ... FOR UPDATE` form is subject to the same considerations for **locking** as `INSERT`, `UPDATE`, and `DELETE`.

DML statements for an InnoDB table operate in the context of a **transaction**, so their effects can be **committed** or **rolled back** as a single unit.

See also commit.

See also locking.

See also rollback.

See also SQL.

See also transaction.

document id

In the InnoDB **full-text search** feature, a special column in the table containing the **FULLTEXT index**, to uniquely identify the document associated with each **ilist** value. Its name is `FTS_DOC_ID` (uppercase required). The column itself must be of `BIGINT UNSIGNED NOT NULL` type, with a unique index named `FTS_DOC_ID_INDEX`. Preferably, you define this column when creating the table. If InnoDB must add the column to the table while creating a `FULLTEXT` index, the indexing operation is considerably more expensive.

See also full-text search.

See also FULLTEXT index.

See also ilist.

doublewrite buffer

InnoDB uses a novel file flush technique called doublewrite. Before writing **pages** to the **data files**, InnoDB first writes them to a contiguous area called the doublewrite buffer. Only

after the write and the flush to the doublewrite buffer have completed, does InnoDB write the pages to their proper positions in the data file. If the operating system crashes in the middle of a page write, InnoDB can later find a good copy of the page from the doublewrite buffer during **crash recovery**.

Although data is always written twice, the doublewrite buffer does not require twice as much I/O overhead or twice as many I/O operations. Data is written to the buffer itself as a large sequential chunk, with a single `fsync()` call to the operating system.

To turn off the doublewrite buffer, specify the option `innodb_doublewrite=0`.

See also crash recovery.

See also data files.

See also page.

See also purge.

drop

A kind of **DDL** operation that removes a schema object, through a statement such as `DROP TABLE` or `DROP INDEX`. From an InnoDB perspective, the performance considerations of such operations involve the time that the **data dictionary** is locked to ensure that interrelated objects are all updated, the time that is and the time to update memory structures such as the **buffer pool**. For a **table**, the drop operation has somewhat different characteristics than a **truncate** operation (`TRUNCATE TABLE` statement).

See also buffer pool.

See also data dictionary.

See also DDL.

See also table.

See also truncate.

dynamic row format

A row format introduced in the InnoDB Plugin, available as part of the **Barracuda file format**. Because `TEXT` and `BLOB` fields are stored outside of the rest of the page that holds the row data, it is very efficient for rows that include large objects. Since the large fields are typically not accessed to evaluate query conditions, they are not brought into the **buffer pool** as often, resulting in fewer I/O operations and better utilization of cache memory.

See also Barracuda.

See also buffer pool.

See also file format.

See also row format.

E

early adopter

A stage similar to beta, when a software product is typically evaluated for performance, functionality, and compatibility in a non-mission-critical setting. InnoDB uses the **early adopter** designation rather than **beta**, through a succession of point releases leading up to a **GA** release.

See also beta.

See also GA.

error log

A type of **log** showing information about MySQL startup and critical runtime errors and crash information. For details, see Section 5.2.2, “The Error Log”.

See also log.

eviction

The process of removing an item from a cache or other temporary storage area, such as the InnoDB **buffer pool**. Often, but not always, uses the **LRU** algorithm to determine which item to remove. When a **dirty page** is evicted, its contents are **flushed** to disk, and any **dirty neighbor** pages might be flushed also.

See also buffer pool.

See also dirty page.

See also flush.

See also LRU.

exclusive lock

A kind of **lock** that prevents any other **transaction** from locking the same row. Depending on the transaction **isolation level**, this kind of lock might block other transactions from writing to the same row, or might also block other transactions from reading the same row. The default InnoDB isolation level, **REPEATABLE READ**, enables higher **concurrency** by allowing transactions to read rows that have exclusive locks, a technique known as **consistent read**.

See also concurrency.

See also consistent read.

See also isolation level.

See also lock.

See also REPEATABLE READ.

See also shared lock.

See also transaction.

extent

A group of **pages** within a **tablespace** totaling 1 megabyte. With the default **page size** of 16KB, an extent contains 64 pages. In MySQL 5.6, the page size can also be 4KB or 8KB, in which case an extent contains more pages, still adding up to 1MB.

InnoDB features such as **segments**, **read-ahead** requests and the **doublewrite buffer** use I/O operations that read, write, allocate, or free data one extent at a time.

See also doublewrite buffer.

See also neighbor page.

See also page.

See also page size.

See also read-ahead.

See also segment.

See also tablespace.

F

Fast Index Creation

A capability first introduced in the InnoDB Plugin, now part of the MySQL server in 5.5 and higher, that speeds up creation of InnoDB **secondary indexes** by avoiding the need to completely rewrite the associated table. The speedup applies to dropping secondary indexes also.

Because index maintenance can add performance overhead to many data transfer operations, consider doing operations such as `ALTER TABLE ... ENGINE=INNODB` or `INSERT INTO ... SELECT * FROM ...` without any secondary indexes in place, and creating the indexes afterward.

See also index.

See also secondary index.

fast shutdown

The default **shutdown** procedure for InnoDB, based on the configuration setting `innodb_fast_shutdown=1`. To save time, certain **flush** operations are skipped. This type of shutdown is safe during normal usage, because the flush operations are performed during the next startup, using the same mechanism as in **crash recovery**. In cases where the database is be-

ing shut down for an upgrade or downgrade, do a **slow shutdown** instead to ensure that all relevant changes are applied to the **data files** during the shutdown.

See also crash recovery.

See also data files.

See also flush.

See also shutdown.

See also slow shutdown.

file format

The format used by InnoDB for each table, typically with the **file-per-table** setting enabled so that each table is stored in a separate `.ibd` **file**. Currently, the file formats available in InnoDB are known as **Antelope** and **Barracuda**. Each file format supports one or more **row formats**. The row formats available for Barracuda tables, **COMPRESSED** and **DYNAMIC**, enable important new storage features for InnoDB tables.

See also Antelope.

See also Barracuda.

See also file-per-table.

See also .ibd file.

See also ibdata file.

See also row format.

file-per-table

A general name for the setting controlled by the `innodb_file_per_table` option. For each table created while this setting is in effect, the data is stored in a separate **.ibd file** rather than in the **system tablespace**. When table data is stored in a separate file, you have more flexibility to choose nondefault **file formats** and **row formats**, which are required for features such as data **compression**. The `TRUNCATE TABLE` operation is also much faster, and the reclaimed space can be used by the operating system rather than remaining reserved for InnoDB.

The **MySQL Enterprise Backup** product is more flexible for tables that are in their own files. For example, tables can be excluded from a backup, but only if they are in separate files. Thus, this setting is suitable for tables that are backed up less frequently or on a different schedule.

See also compressed row format.

See also compression.

See also file format.

See also ibdata file.

See also innodb_file_per_table.

See also row format.

See also system tablespace.

fill factor

In an InnoDB **index**, the proportion of a **page** that is taken up by index data before the page is split. The unused space when index data is first divided between pages allows for rows to be updated with longer string values without requiring expensive index maintenance operations. If the fill factor is too low, the index consumes more space than needed, causing extra I/O overhead when reading the index. If the fill factor is too high, any update that increases the length of column values can cause extra I/O overhead for index maintenance.

See also index.

See also page.

fixed row format

This row format is used by the MyISAM storage engine, not by InnoDB. If you create an InnoDB table with the option `row_format=fixed`, InnoDB translates this option to use the **compact row format** instead, although the `fixed` value might still show up in output such as `SHOW TABLE STATUS` reports.

See also compact row format.

See also row format.

flush

To write changes to the database files, that had been buffered in a memory area or a temporary disk storage area. The InnoDB storage structures that are periodically flushed include the **redo log**, the **undo log**, and the **buffer pool**.

Flushing can happen because a memory area becomes full and the system needs to free some space, because a **commit** operation means the changes from a transaction can be finalized, or because a **slow shutdown** operation means that all outstanding work should be finalized. When it is not critical to flush all the buffered data at once, `InnoDB` can use a technique called **fuzzy checkpointing** to flush small batches of pages to spread out the I/O overhead.

See also buffer pool.

See also commit.

See also fuzzy checkpointing.

See also neighbor page.

See also redo log.

See also slow shutdown.

See also undo log.

flush list

An internal InnoDB data structure that tracks **pages** in the **buffer pool** that have been changed and need to be written back out to disk. This data structure is updated frequently by InnoDB's internal **mini-transactions**, and so is protected by its own **mutex** to allow concurrent access to the buffer pool.

See also buffer pool.

See also LRU.

See also mini-transaction.

See also mutex.

See also page.

See also page cleaner.

foreign key

A type of pointer relationship, between rows in separate InnoDB tables. The foreign key relationship is defined on one column in both the **parent table** and the **child table**.

In addition to enabling fast lookup of related information, foreign keys help to enforce **referential integrity**, by preventing any of these pointers from becoming invalid as data is inserted, updated, and deleted. This enforcement mechanism is a type of **constraint**. A row that points to another table cannot be inserted if the associated foreign key value does not exist in the other table. If a row is deleted or its foreign key value changed, and rows in another table point to that foreign key value, the foreign key can be set up to prevent the deletion, cause the corresponding column values in the other table to become **null**, or automatically delete the corresponding rows in the other table.

One of the stages in designing a **normalized** database is to identify data that is duplicated, separate that data into a new table, and set up a foreign key relationship so that the multiple tables can be queried like a single table, using a **join** operation.

See also child table.

See also FOREIGN KEY constraint.

See also join.

See also normalized.

See also NULL.

See also parent table.

See also referential integrity.

See also relational.

FOREIGN KEY constraint

The type of **constraint** that maintains database consistency through a **foreign key** relationship. Unlike other kinds of constraints that prevent data from being inserted or updated, `FOREIGN KEY` constraints can also cause data in **child rows** to be deleted, changed to different values, or set to **null**, based on the `ON CASCADE` option specified when creating the foreign key.

See also child table.

See also constraint.

See also foreign key.

See also NULL.

.frm file

The file containing the metadata, such as the table definition, of a MySQL table.

For backups, you must always keep the full set of `.frm` files along with the backup data, to be able to restore tables that are altered or dropped after the backup. Files with this extension are always included in backups produced by the **mysqlbackup** command of the **MySQL Enterprise Backup** product. If you use the **ibbackup** command instead, you must copy the `.frm` files yourself.

Although each InnoDB table has a `.frm` file, InnoDB maintains its own table metadata in the **system tablespace**; the `.frm` files are not needed for InnoDB to operate on InnoDB tables.

These files are backed up by the **MySQL Enterprise Backup** product. These files must not be modified by an `ALTER TABLE` operation while the backup is taking place, which is why backups that include non-InnoDB tables perform a `FLUSH TABLES WITH READ LOCK` operation to freeze such activity while backing up the `.frm` files. Restoring a backup can result in `.frm` files being created, changed, or removed to match the state of the database at the time of the backup.

See also ibbackup command.

See also MySQL Enterprise Backup.

See also mysqlbackup command.

See also system tablespace.

FTS

Acronym for **full-text search**.

See also full-text search.

full backup

A **backup** that includes all the **tables** in each MySQL **database**, and all the databases in a MySQL **instance**. Contrast with **partial backup**.

See also backup.

See also database.

See also instance.

See also partial backup.

See also table.

full table scan

An operation that requires reading the entire contents of a table, rather than just selected portions using an index. Typically performed either with small lookup tables, or in data warehousing situations with large tables where all available data is aggregated and analyzed. How frequently these operations occur, and the sizes of the tables relative to available memory, have implications for the algorithms used in query optimization and managing the buffer pool.

The purpose of **indexes** is to allow lookups for specific values or ranges of values within a large table, thus avoiding full table scans when practical.

See also buffer pool.

See also index.

See also LRU.

full-text search

The MySQL feature for finding words, phrases, Boolean combinations of words, and so on within table data, in a faster, more convenient, and more flexible way than using the SQL `LIKE` operator or writing your own application-level search algorithm. It uses the SQL function `MATCH()` and **FULLTEXT indexes**.

See also FULLTEXT index.

FULLTEXT index

The special kind of **index** that holds the **search index** in the MySQL **full-text search** mechanism. Originally, only available for `MyISAM` tables. Starting in MySQL 5.6.4, it is also available for **InnoDB** tables.

See also full-text search.

See also index.

See also InnoDB.

See also search index.

fuzzy checkpointing

A technique that **flushes** small batches of **dirty pages** from the **buffer pool**, rather than flushing all dirty pages at once which would disrupt database processing.

See also buffer pool.

See also dirty page.

See also flush.

G

GA

"Generally available", the stage when a software product leaves beta and is available for sale, official support, and production use.

See also beta.

See also early adopter.

gap

A place in an InnoDB **index** data structure where new values could be inserted. When you lock a set of rows with a statement such as `SELECT ... FOR UPDATE`, InnoDB can create locks that apply to the gaps as well as the actual values in the index. For example, if you select all values greater than 10 for update, a gap lock prevents another transaction from inserting a new value that is greater than 10. The **supremum record** and **infimum record** represent the gaps containing all values greater than or less than all the current index values.

See also concurrency.

See also gap lock.

See also index.

See also infimum record.

See also isolation level.

See also supremum record.

gap lock

A **lock** on a **gap** between index records, or a lock on the gap before the first or after the last index record. For example, `SELECT c1 FOR UPDATE FROM t WHERE c1 BETWEEN 10 and 20;` prevents other transactions from inserting a value of 15 into the column `t.c1`, whether or not there was already any such value in the column, because the gaps between all existing values in the range are locked. Contrast with **record lock** and **next-key lock**.

Gap locks are part of the tradeoff between performance and **concurrency**, and are used in some transaction **isolation levels** and not others.

See also gap.

See also infimum record.

See also lock.

See also next-key lock.

See also record lock.

See also supremum record.

general log — See general query log.

general query log — A type of **log** used for diagnosis and troubleshooting of SQL statements processed by the MySQL server. Can be stored in a file or in a database table. You must enable this feature to use it. Records a broader range of queries than the **slow query log**. Unlike the **binary log**, which is used for replication, the general query log contains `SELECT` statements and does not maintain strict ordering. For more information, see Section 5.2.3, “The General Query Log”.

See also binary log.

See also general query log.

See also log.

global_transaction — A type of **transaction** involved in **XA** operations. It consists of several actions that are transactional in themselves, but that all must either complete successfully as a group, or all be rolled back as a group. In essence, this extends **ACID** properties “up a level” so that multiple ACID transactions can be executed in concert as components of a global operation that also has ACID properties. For this type of distributed transaction, you must use the **SERIALIZABLE** isolation level to achieve ACID properties.

See also ACID.

See also SERIALIZABLE.

See also transaction.

See also XA.

group commit — An `InnoDB` optimization that performs some low-level I/O operations (**log write**) once for a set of **commit** operations, rather than flushing and syncing separately for each commit.

When the binlog is enabled, you typically also set the configuration option `sync_binlog=0`, because group commit for the binary log is only supported if it is set to 0.

See also commit.

See also plugin.

See also XA.

H

hash index — A type of **index** intended for queries that use equality operators, rather than range operators such as greater-than or `BETWEEN`. It is available in only the `MEMORY` storage engine. Although hash indexes are the default for `MEMORY` tables for historic reasons, that storage engine also supports **B-tree** indexes, which are often a better choice for general-purpose queries.

The InnoDB storage engine includes a variant of this index type, the **adaptive hash index**, that is constructed automatically if needed based on runtime conditions.

See also adaptive hash index.

See also B-tree.

See also index.

HDD

Acronym for “hard disk drive”. Refers to storage media using spinning platters, usually when comparing and contrasting with **SSD**. Its performance characteristics can influence the throughput of a **disk-based** workload.

See also disk-based.

See also SSD.

heartbeat

A periodic message that is sent to indicate that a system is functioning properly. In a **replication** context, if the **master** stops sending such messages, one of the **slaves** can take its place. Similar techniques can be used between the servers in a cluster environment, to confirm that all of them are operating properly.

See also replication.

hot

A condition where a row, table, or internal data structure is accessed so frequently, requiring some form of locking or mutual exclusion, that it results in a performance or scalability issue.

Although “hot” typically indicates an undesirable condition, a **hot backup** is the preferred type of backup.

See also hot backup.

hot backup

A backup taken while the database and is running and applications are reading and writing to it. The backup involves more than simply copying data files: it must include any data that was inserted or updated while the backup was in process; it must exclude any data that was deleted while the backup was in process; and it must ignore any changes that were not committed.

The Oracle product that performs hot backups, of InnoDB tables especially but also tables from MyISAM and other storage engines, is known as **MySQL Enterprise Backup**.

The hot backup process consists of two stages. The initial copying of the data files produces a **raw backup**. The **apply** step incorporates any changes to the database that happened while the backup was running. Applying the changes produces a **prepared** backup; these files are ready to be restored whenever necessary.

See also apply.

See also MySQL Enterprise Backup.

See also prepared backup.

See also raw backup.

I

ib-file set

The set of files managed by InnoDB within a MySQL database: the **system tablespace**, any **file-per-table** tablespaces, and the (typically 2) **redo log** files. Used sometimes in detailed discussions of InnoDB file structures and formats, to avoid ambiguity between the meanings of **database** between different DBMS products, and the non-InnoDB files that may be part of a MySQL database.

See also database.

See also file-per-table.

See also redo log.

See also system tablespace.

ib_logfile

A set of files, typically named `ib_logfile0` and `ib_logfile1`, that form the **redo log**. Also sometimes referred to as the **log group**. These files record statements that attempt to change data in InnoDB tables. These statements are replayed automatically to correct data written by incomplete transactions, on startup following a crash.

This data cannot be used for manual recovery; for that type of operation, use the **binary log**.

See also binary log.

See also log group.

See also redo log.

ibbackup command

The fundamental command-line tool of the **MySQL Enterprise Backup** product. It performs a **hot backup** operation for InnoDB tables. You use this command directly if all your data is in InnoDB tables, if all the important data that you need to back up is in InnoDB tables, or if you are running on the Windows platform. If you also need to back up tables from MyISAM or other storage engines, you use the **mysqlbackup command** instead (available on UNIX and Linux systems only).

See also hot backup.

See also MySQL Enterprise Backup.

See also mysqlbackup command.

ibbackup_logfile

A supplemental backup file created by the **MySQL Enterprise Backup** product during a **hot backup** operation. It contains information about any data changes that occurred while the backup was running. The initial backup files, including `ibbackup_logfile`, are known as a **raw backup**, because the changes that occurred during the backup operation are not yet incorporated. After you perform the **apply** step to the raw backup files, the resulting files do include those final data changes, and are known as a **prepared backup**. At this stage, the `ibbackup_logfile` file is no longer necessary.

See also apply.

See also hot backup.

See also MySQL Enterprise Backup.

See also prepared backup.

See also raw backup.

.ibd file

Each InnoDB **table** created using the **file-per-table** mode goes into its own **tablespace** file, with a `.ibd` extension, inside the **database** directory. This file contains the table data and any **indexes** for the table.

This extension does not apply to the **system tablespace**, which consists of the **ibdata files**.

When a `.ibd` file is included in a compressed backup by the **MySQL Enterprise** Backup product, the compressed equivalent is a `.ibz` file.

See also database.

See also file-per-table.

See also ibdata file.

See also .ibz file.

See also index.

See also MySQL Enterprise Backup.

See also system tablespace.

See also table.

See also tablespace.

ibdata file

A set of files with names such as `ibdata1`, `ibdata2`, and so on, that make up the InnoDB **system tablespace**. These files contain metadata about InnoDB tables, and can contain some or all of the table data also (depending on whether the **file-per-table** option is in effect when each table is created).

See also file-per-table.

See also system tablespace.

.ibz file

When the **MySQL Enterprise Backup** product performs a **compressed backup**, it transforms each **tablespace** file that is created using the **file-per-table** setting from a `.ibd` extension to a `.ibz` extension.

The compression applied during backup is distinct from the **compressed row format** that keeps table data compressed during normal operation. A compressed backup operation skips the compression step for a tablespace that is already in compressed row format, as compressing a second time would slow down the backup but produce little or no space savings.

See also compressed backup.

See also compressed row format.

See also file-per-table.

See also .ibd file.

See also MySQL Enterprise Backup.

See also tablespace.

ilist

Within an InnoDB **FULLTEXT index**, the data structure consisting of a document ID and positional information for a token (that is, a particular word).

See also FULLTEXT index.

implicit row lock

A row lock that InnoDB acquires to ensure consistency, without you specifically requesting it.

See also row lock.

in-memory database

A type of database system that maintains data in memory, to avoid overhead due to disk I/O and translation between disk blocks and memory areas. Some in-memory databases sacrifice durability (the “D” in the **ACID** design philosophy) and are vulnerable to hardware, power, and other types of failures, making them more suitable for read-only operations. Other in-memory databases do use durability mechanisms such as logging changes to disk or using non-volatile memory.

MySQL features that are address the same kinds of memory-intensive processing include the `MEMORY` storage engine, the InnoDB **buffer pool** and **adaptive hash index**, the MyISAM key cache, and the MySQL **query cache**.

See also ACID.

See also adaptive hash index.

See also buffer pool.

See also disk-based.

incremental backup

A type of **hot backup**, performed by the **MySQL Enterprise Backup** product, that only saves data changed since some point in time. Having a full backup and a succession of incremental backups lets you reconstruct backup data over a long period, without the storage overhead of keeping several full backups on hand. You can restore the full backup and then apply each of the incremental backups in succession, or you can keep the full backup up-to-date by applying each incremental backup to it, then perform a single restore operation.

The granularity of changed data is at the **page** level. A page might actually cover more than one row. Each changed page is included in the backup.

See also hot backup.

See also MySQL Enterprise Backup.

See also page.

index

A data structure that provides a fast lookup capability for **rows** of a **table**, typically by forming a tree structure (**B-tree)** representing all the values of a particular **column** or set of columns.

InnoDB tables always have a **clustered index** representing the **primary key**. They can also

have one or more **secondary indexes** defined on one or more columns. Depending on their structure, secondary indexes can be classified as **partial**, **column**, or **composite** indexes.

Indexes are a crucial aspect of **query** performance. Database architects design tables, queries, and indexes to allow fast lookups for data needed by applications. The ideal database design uses a **covering index** where practical; the query results are computed entirely from the index, without reading the actual table data. Each **foreign key** constraint also requires an index, to efficiently check whether values exist in both the **parent** and **child** tables.

Although a B-tree index is the most common, a different kind of data structure is used for **hash indexes**, as in the `MEMORY` storage engine and the InnoDB **adaptive hash index**.

See also adaptive hash index.

See also B-tree.

See also child table.

See also clustered index.

See also column index.

See also composite index.

See also covering index.

See also foreign key.

See also hash index.

See also parent table.

See also partial index.

See also primary key.

See also query.

See also row.

See also secondary index.

See also table.

index cache

A memory area that holds the token data for InnoDB **full-text search**. It buffers the data to minimize disk I/O when data is inserted or updated in columns that are part of a **FULLTEXT index**. The token data is written to disk when the index cache becomes full. Each InnoDB `FULLTEXT` index has its own separate index cache, whose size is controlled by the configuration option `innodb_ft_cache_size`.

See also full-text search.

See also FULLTEXT index.

index hint

Extended SQL syntax for overriding the **indexes** recommended by the optimizer. For example, the `FORCE INDEX`, `USE INDEX`, and `IGNORE INDEX` clauses. Typically used when indexed columns have unevenly distributed values, resulting in inaccurate **cardinality** estimates.

See also cardinality.

See also index.

index prefix

In an **index** that applies to multiple columns (known as a **composite index**), the initial or leading columns of the index. A query that references the first 1, 2, 3, and so on columns of a composite index can use the index, even if the query does not reference all the columns in the index.

See also composite index.

See also index.

infimum record

A **pseudo-record** in an **index**, representing the **gap** below the smallest value in that index. If a transaction has a statement such as `SELECT ... FOR UPDATE ... WHERE col < 10;`, and the smallest value in the column is 5, it is a lock on the infimum record that prevents other transactions from inserting even smaller values such as 0, -10, and so on.

See also gap.

See also index.

See also pseudo-record.

See also supremum record.

INFORMATION_SCHEMA

The name of the **database** that provides a query interface to the MySQL **data dictionary**. (This name is defined by the ANSI SQL standard.) To examine information (metadata) about the database, you can query tables such as `INFORMATION_SCHEMA.TABLES` and `INFORMATION_SCHEMA.COLUMNS`, rather than using `SHOW` commands that produce unstructured output.

The information schema contains some tables that are specific to **InnoDB**, such as `INNODB_LOCKS` and `INNODB_TRX`. You use these tables not to see how the database is structured, but to get real-time information about the workings of the InnoDB storage engine to help with performance monitoring, tuning, and troubleshooting. In particular, these tables provide information about the InnoDB features related to **compression**, and **transactions** and their associated **locks**.

See also compression.

See also data dictionary.

See also database.

See also InnoDB.

See also lock.

See also transaction.

innobackup command

A **backup** command from the former **InnoDB Hot Backup** product. It is superceded by the **`mysqlbackup`** command in the **MySQL Enterprise Backup** product.

See also backup.

See also InnoDB Hot Backup.

See also MySQL Enterprise Backup.

See also mysqlbackup command.

InnoDB

A **storage engine** for MySQL that combines high performance with **transactional** capability (that is, reliability, robustness, and concurrent access -- the **ACID** design philosophy). Tables created under the InnoDB storage engine are ideally suited for **hot backups**. In MySQL 5.5 and higher, InnoDB is the default storage engine for new tables.

See also ACID.

See also hot backup.

See also storage engine.

See also transaction.

InnoDB Hot Backup

A licensed backup product, superceded in MySQL 5.1 and above by **MySQL Enterprise Backup**.

See also MySQL Enterprise Backup.

innodb_autoinc_lock_mode

The option that controls the algorithm used for **auto-increment locking**. When you have an auto-incrementing **primary key**, you can use statement-based replication only with the setting `innodb_autoinc_lock_mode=1`. This setting is known as **consecutive** lock mode, because multi-row inserts within a transaction receive consecutive auto-increment values. If

you have `innodb_autoinc_lock_mode=2`, which allows higher concurrency for insert operations, use row-based replication rather than statement-based replication. This setting is known as **interleaved** lock mode, because multiple multi-row insert statements running at the same time can receive autoincrement values that are interleaved. The setting `innodb_autoinc_lock_mode=0` is the previous (traditional) default setting and should not be used except for compatibility purposes.

See also auto-increment locking.

See also primary key.

innodb_file_format

A setting that determines the **file format** for all InnoDB **tablespaces** created after you specify a value for this option. To create tablespaces other than the **system tablespace**, you must also use the **file-per-table** option. Currently, you can specify the **Antelope** and **Barracuda** file formats.

See also Antelope.

See also Barracuda.

See also file format.

See also file-per-table.

See also innodb_file_per_table.

See also system tablespace.

See also tablespace.

innodb_file_per_table

The option that turns on the **file-per-table** setting, which stores each newly created InnoDB table and its associated index in its own **.ibd file**, outside the **system tablespace**.

This option affects the performance and storage considerations for a number of SQL statements, such as `DROP TABLE` and `TRUNCATE TABLE`.

This option is needed to take full advantage of many other InnoDB features, such as such as table **compression**, or backups of named tables in **MySQL Enterprise Backup**.

This option was once static, but can now be set using the `SET GLOBAL` command.

For reference information, see `innodb_file_per_table`. For usage information, see Section 13.3.3, “Using Per-Table Tablespaces”.

See also compression.

See also file-per-table.

See also .ibd file.

See also MySQL Enterprise Backup.

See also system tablespace.

innodb_lock_wait_timeout

A setting that sets the balance between **waiting** for shared resources to become available, or giving up and handling the error, retrying, or doing alternative processing in your application. Rolls back any InnoDB transaction that waits more than a specified time to acquire a **lock**. Especially useful if **deadlocks** are caused by updates to multiple tables controlled by different storage engines; such deadlocks are not **detected** automatically.

See also deadlock.

See also deadlock detection.

See also lock.

See also wait.

innodb_strict_mode

The option that controls whether InnoDB operates in **strict mode**, where conditions that are normally treated as warnings, cause errors instead (and the underlying statements fail).

This mode is the default setting in MySQL 5.5.5 and higher.

See also strict mode.

insert

One of the primary **DML** operations in **SQL**. The performance of inserts is a key factor in **data warehouse** systems that load millions of rows into tables, and **OLTP** systems where many concurrent connections might insert rows into the same table, in arbitrary order. If insert performance is important to you, you should learn about **InnoDB** features such as the **insert buffer** used in **change buffering**, and **auto-increment** columns.

See also auto-increment.

See also change buffering.

See also data warehouse.

See also DML.

See also InnoDB.

See also insert buffer.

See also OLTP.

See also SQL.

insert buffer

Former name for the **change buffer**. Now that **change buffering** includes delete and update operations as well as inserts, “change buffer” is the preferred term.

See also change buffer.

See also change buffering.

insert buffering

The technique of storing secondary index changes due to `INSERT` operations in the **insert buffer** rather than writing them immediately, so that the physical writes can be performed to minimize random I/O. It is one of the types of **change buffering**; the others are **delete buffering** and **purge buffering**.

Insert buffering is not used if the secondary index is unique, because the uniqueness of new values cannot be verified before the new entries are written out. Other kinds of change buffering do work for unique indexes.

See also change buffering.

See also delete buffering.

See also insert buffer.

See also purge buffering.

instance

A single **mysqld** daemon managing a **data directory** representing one or more **databases** with a set of **tables**. It is common in development, testing, and some **replication** scenarios to have multiple instances on the same **server** machine, each managing its own data directory and listening on its own port or socket. With one instance running a **disk-bound** workload, the server might still have extra CPU and memory capacity to run additional instances.

See also data directory.

See also database.

See also disk-bound.

See also mysqld.

See also replication.

See also server.

instrumentation

Modifications at the source code level to collect performance data for tuning and debugging. In MySQL, data collected by instrumentation is exposed through a SQL interface using the `INFORMATION_SCHEMA` and `PERFORMANCE_SCHEMA` databases.

See also INFORMATION_SCHEMA.

See also Performance Schema.

intention exclusive lock — See intention lock.

intention lock — A kind of **lock** that applies to the table level, used to indicate what kind of lock the transaction intends to acquire on rows in the table. Different transactions can acquire different kinds of intention locks on the same table, but the first transaction to acquire an **intention exclusive** (IX) lock on a table prevents other transactions from acquiring any S or X locks on the table. Conversely, the first transaction to acquire an **intention shared** (IS) lock on a table prevents other transactions from acquiring any X locks on the table. The two-phase process allows the lock requests to be resolved in order, without blocking locks and corresponding operations that are compatible. For more details on this locking mechanism, see Section 13.3.9.1, “`InnoDB` Lock Modes”.

See also lock.

See also lock mode.

See also locking.

intention shared lock — See intention lock.

inverted index — A data structure optimized for document retrieval systems, used in the implementation of InnoDB **full-text search**. The InnoDB **FULLTEXT index**, implemented as an inverted index, records the position of each word within a document, rather than the location of a table row. A single column value (a document stored as a text string) is represented by many entries in the inverted index.

See also full-text search.

See also FULLTEXT index.

See also ilist.

isolation level — One of the foundations of database processing. Isolation is the **I** in the acronym **ACID**; the isolation level is the setting that fine-tunes the balance between performance and reliability, consistency, and reproducibility of results when multiple **transactions** are making changes and performing queries at the same time.

From highest amount of consistency and protection to the least, the isolation levels supported by InnoDB are: **SERIALIZABLE**, **REPEATABLE READ**, **READ COMMITTED**, and **READ UNCOMMITTED**.

With the built-in InnoDB storage engine and the InnoDB Plugin, many users can keep the default isolation level (**REPEATABLE READ**) for all operations. Expert users might choose the **read committed** level as they push the boundaries of scalability with OLTP processing, or during data warehousing operations where minor inconsistencies do not affect the aggregate results of large amounts of data. The levels on the edges (**SERIALIZABLE** and **READ UNCOMMITTED**) change the processing behavior to such an extent that they are rarely used.

See also ACID.

See also READ COMMITTED.

See also READ UNCOMMITTED.

See also REPEATABLE READ.

See also SERIALIZABLE.

See also transaction.

J

join — A **query** that retrieves data from more than one table, by referencing columns in the tables that hold identical values.

Ideally, these columns are part of an InnoDB **foreign key** relationship, which ensures **referential integrity** and that the join columns are **indexed**. Often used to save space and improve query performance by replacing repeated strings with numeric IDs, in a **normalized** data design.

See also foreign key.

See also index.

See also normalized.

See also query.

See also referential integrity.

K

KEY_BLOCK_SIZE
: An option to specify the size of data pages within an InnoDB table that uses **compressed row format**. The default is 8 kilobytes. Lower values risk hitting internal limits that depend on the combination of row size and compression percentage.

  See also compressed row format.

L

latch
: A lightweight structure used by InnoDB to implement a **lock** for its own internal memory structures, typically held for a brief time measured in milliseconds or microseconds. A general term that includes both **mutexes** (for exclusive access) and **rw-locks** (for shared access). Certain latches are the focus of performance tuning within the InnoDB storage engine, such as the **data dictionary** mutex. Statistics about latch use and contention are available through the **Performance Schema** interface.

  See also data dictionary.

  See also lock.

  See also locking.

  See also mutex.

  See also Performance Schema.

  See also rw-lock.

list
: The InnoDB **buffer pool** is represented as a list of memory **pages**. The list is reordered as new pages are accessed and enter the buffer pool, as pages within the buffer pool are accessed again and are considered newer, and as pages that are not accessed for a long time are **evicted** from the buffer pool. The buffer pool is actually divided into **sublists**, and the replacement policy is a variation of the familiar **LRU** technique.

  See also buffer pool.

  See also eviction.

  See also LRU.

  See also sublist.

lock
: The high-level notion of an object that controls access to a resource, such as a table, row, or internal data structure, as part of a **locking** strategy. For intensive performance tuning, you might delve into the actual structures that implement locks, such as **mutexes** and **latches**.

  See also latch.

  See also lock mode.

  See also locking.

  See also mutex.

lock escalation

An operation used in some database systems that converts many row locks into a single table lock, saving memory space but reducing concurrent access to the table. InnoDB uses a space-efficient representation for row locks, so that lock escalation is not needed.

See also locking.

See also row lock.

See also table lock.

lock mode

A shared (S) lock allows a transaction to read a row. Multiple transactions can acquire an S lock on that same row at the same time.

An exclusive (X) lock allows a transaction to update or delete a row. No other transaction can acquire any kind of lock on that same row at the same time.

Intention locks apply to the table level, and are used to indicate what kind of lock the transaction intends to acquire on rows in the table. Different transactions can acquire different kinds of intention locks on the same table, but the first transaction to acquire an intention exclusive (IX) lock on a table prevents other transactions from acquiring any S or X locks on the table. Conversely, the first transaction to acquire an intention shared (IS) lock on a table prevents other transactions from acquiring any X locks on the table. The two-phase process allows the lock requests to be resolved in order, without blocking locks and corresponding operations that are compatible.

See also intention lock.

See also lock.

See also locking.

locking

The system of protecting a **transaction** from seeing or changing data that is being queried or changed by other transactions. The locking strategy must balance reliability and consistency of database operations (the principles of the **ACID** philosophy) against the performance needed for good **concurrency**. Fine-tuning the locking strategy often involves choosing an **isolation level** and ensuring all your database operations are safe and reliable for that isolation level.

See also ACID.

See also concurrency.

See also isolation level.

See also latch.

See also lock.

See also mutex.

See also transaction.

locking read

A `SELECT` statement that also performs a **locking** operation on an `InnoDB` table. Either `SELECT ... FOR UPDATE` or `SELECT ... LOCK IN SHARE MODE`. It has the potential to produce a **deadlock**, depending on the **isolation level** of the transaction.

See also deadlock.

See also isolation level.

See also locking.

log

In the InnoDB context, “log” or “log files” typically refers to the **redo log** represented by the **ib_logfile*** files. Another log area, which is physically part of the **system tablespace**, is the **undo log**.

Other kinds of logs that are important in MySQL are the **error log**, **binary log**, the **general query log**, and the **slow query log**.

See also binary log.

See also error log.

See also general query log.

See also ib_logfile.

See also redo log.

See also slow query log.

See also system tablespace.

See also undo log.

log buffer

The memory area that holds data to be written to the **log files** that make up the **redo log**. It is controlled by the `innodb_log_buffer_size` configuration option.

See also log file.

See also redo log.

log file

One of the `ib_logfile`*N* files that make up the **redo log**. Data is written to these files from the **log buffer** memory area.

See also ib_logfile.

See also log buffer.

See also redo log.

log group

The set of files that make up the **redo log**, typically named `ib_logfile0` and `ib_logfile1`. (For that reason, sometimes referred to collectively as **ib_logfile**.)

See also ib_logfile.

See also redo log.

logical

A type of operation that involves high-level, abstract aspects such as tables, queries, indexes, and other SQL concepts. Typically, logical aspects are important to make database administration and application development convenient and usable. Contrast with **physical**.

See also logical backup.

See also physical.

logical backup

A **backup** that reproduces table structure and data, without copying the actual data files. For example, the **`mysqldump`** command produces a logical backup, because its output contains statements such as `CREATE TABLE` and `INSERT` that can re-create the data. Contrast with **physical backup**. A logical backup offers flexibility (for example, you could edit table definitions or insert statements before restoring), but can take substantially longer to **restore** than a physical backup.

See also backup.

See also mysqldump.

See also physical backup.

See also restore.

loose_

In MySQL 5.1, a prefix added to InnoDB configuration options when installing the InnoDB **Plugin** after server startup, so any new configuration options not recognized by the current level of MySQL do not cause a startup failure. MySQL processes configuration options that start with this prefix, but gives a warning rather than a failure if the part after the prefix is not a recognized option.

See also plugin.

LRU

An acronym for “least recently used”, a common method for managing storage areas. The items that have not been used recently are **evicted** when space is needed to cache newer items. InnoDB uses the LRU mechanism by default to manage the **pages** within the **buffer pool**, but makes exceptions in cases where a page might be read only a single time, such as during a **full table scan**. This variation of the LRU algorithm is called the **midpoint insertion strategy**. The ways in which the buffer pool management differs from the traditional LRU algorithm is fine-tuned by the options `innodb_old_blocks_pct`, `innodb_old_blocks_time`, and the new MySQL 5.6 options `innodb_lru_scan_depth` and `innodb_flush_neighbors`.

See also buffer pool.

See also eviction.

See also full table scan.

See also midpoint insertion strategy.

LSN

Acronym for “log sequence number”. This arbitrary, ever-increasing value represents a point in time corresponding to operations recorded in the **redo log**. (This point in time is regardless of **transaction** boundaries; it can fall in the middle of one or more transactions.) It is used internally by InnoDB during crash recovery and for managing the buffer pool.

In the **MySQL Enterprise Backup** product, you can specify an LSN to represent the point in time from which to take an **incremental backup**. The relevant LSN is displayed by the output of the `ibbackup` command. Once you have the LSN corresponding to the time of a full backup, you can specify that value to take a subsequent incremental backup, whose output contains another LSN for the next incremental backup.

See also incremental backup.

See also MySQL Enterprise Backup.

See also redo log.

See also transaction.

M

master server

Frequently shortened to “master”. A database server machine in a **replication** scenario that processes the initial insert, update, and delete requests for data. These changes are propagated to, and repeated on, other servers known as **slave servers**.

See also replication.

See also slave server.

master thread

An InnoDB **thread** that performs various tasks in the background. Most of these tasks are I/O related, such as writing changes from the **insert buffer** to the appropriate secondary indexes.

To improve **concurrency**, sometimes actions are moved from the master thread to separate background threads. For example, in MySQL 5.6 and higher, **dirty pages** are **flushed** from the **buffer pool** by the **page cleaner** thread rather than the master thread.

See also buffer pool.

See also dirty page.

See also flush.

See also insert buffer.

See also page cleaner.

See also thread.

merge

To apply changes to data cached in memory, such as when a page is brought into the **buffer pool**, and any applicable changes recorded in the **change buffer** are incorporated into the page in the buffer pool. The updated data is eventually written to the **tablespace** by the **flush** mechanism.

See also buffer pool.

See also change buffer.

See also flush.

See also tablespace.

metrics counter

A feature implemented by the `innodb_metrics` table in the **information_schema**, in MySQL 5.6 and higher. You can query **counts** and totals for low-level InnoDB operations, and use the results for performance tuning in combination with data from the **performance_schema**.

See also counter.

See also INFORMATION_SCHEMA.

See also Performance Schema.

midpoint insertion strategy

The technique of initially bringing **pages** into the InnoDB **buffer pool** not at the "newest" end of the list, but instead somewhere in the middle. The exact location of this point can vary, based on the setting of the `innodb_old_blocks_pct` option. The intent is that blocks that are only read once, such as during a **full table scan**, can be aged out of the buffer pool sooner than with a strict **LRU** algorithm.

See also buffer pool.

See also full table scan.

See also LRU.

See also page.

mini-transaction

An internal phase of InnoDB processing, when making changes to the **data dictionary** during a **DDL** operation. The changes to the data dictionary are made without affecting the **transaction** that is being processed by MySQL.

See also data dictionary.

See also DDL.

See also transaction.

.MRG file

A file containing references to other tables, used by the `MERGE` storage engine. Files with this extension are always included in backups produced by the `mysqlbackup` command of the **MySQL Enterprise Backup** product.

See also MySQL Enterprise Backup.

See also mysqlbackup command.

multi-core

A type of processor that can take advantage of multi-threaded programs, such as the MySQL server.

multiversion concurrency control

See MVCC.

mutex

Informal abbreviation for "mutex variable". (Mutex itself is short for "mutual exclusion".) The low-level object that InnoDB uses to represent and enforce exclusive-access **locks** to internal in-memory data structures. Once the lock is acquired, any other process, thread, and so on is prevented from acquiring the same lock. Contrast with **rw-locks**, which allow shared access. Mutexes and rw-locks are known collectively as **latches**.

See also latch.

See also lock.

See also Performance Schema.

See also Pthreads.

See also rw-lock.

MVCC

Acronym for "multiversion concurrency control". This technique allows InnoDB **transactions** with certain **isolation levels** perform **consistent read** operations; that is, to query rows that are being updated by other transactions, and see the values from before those updates occurred. This is a powerful technique to increase **concurrency**, by allowing queries to proceed

without waiting due to **locks** held by the other transactions.

This technique is not universal in the database world. Some other database products, and some other storage engines within MySQL, do not support it.

See also ACID.

See also concurrency.

See also consistent read.

See also isolation level.

See also lock.

See also transaction.

my.cnf

The name, on UNIX or Linux systems, of the MySQL option file.

See also my.ini.

See also option file.

my.ini

The name, on Windows systems, of the MySQL option file.

See also my.cnf.

See also option file.

.MYD file

The file that MySQL uses to store data for a MyISAM table. Files with this extension are always included in backups produced by the `mysqlbackup` command of the **MySQL Enterprise Backup** product.

See also .MYI file.

See also MySQL Enterprise Backup.

See also mysqlbackup command.

.MYI file

A file that MySQL uses to store indexes for a MyISAM table. Files with this extension are always included in backups produced by the `mysqlbackup` command of the **MySQL Enterprise Backup** product.

See also .MYD file.

See also MySQL Enterprise Backup.

See also mysqlbackup command.

mysql

The `mysql` program is the command-line interpreter for the MySQL database. It processes **SQL** statements, and also MySQL-specific commands such as `SHOW TABLES`, by passing requests to the **`mysqld`** daemon.

See also mysqld.

See also SQL.

MySQL Enterprise Backup

A licensed product, superceding InnoDB Hot Backup, that performs **hot backups** of MySQL databases. It offers the most efficiency and flexibility when backing up **InnoDB** tables, but can also back up MyISAM and other kinds of tables.

See also hot backup.

See also InnoDB.

mysqlbackup command

A command-line tool of the **MySQL Enterprise Backup** product. It performs a **hot backup** operation for tables from InnoDB, MyISAM, and other storage engines. It calls the **ibbackup command** to back up the InnoDB tables; if you only need to back up InnoDB tables, it can be more efficient to call `ibbackup` directly.

See also hot backup.

See also ibbackup command.

See also MySQL Enterprise Backup.

mysqld

The `mysqld` program is the database engine for the MySQL database. It runs as a UNIX daemon or Windows service, constantly waiting for requests and performing maintenance work in the background.

See also mysql.

mysqldump

A command that performs a **logical backup** of some combination of databases, tables, and table data. The results are SQL statements that reproduce the original schema objects, data, or both. For substantial amounts of data, a **physical backup** solution such as **MySQL Enterprise Backup** is faster, particularly for the **restore** operation.

See also logical backup.

See also MySQL Enterprise Backup.

See also physical backup.

See also restore.

N

neighbor page

Any **page** in the same **extent** as a particular page. When a page is selected to be **flushed**, any neighbor pages that are **dirty** are typically flushed as well, as an I/O optimization for traditional hard disks. In MySQL 5.6 and up, this behavior can be controlled by the configuration variable `innodb_flush_neighbors`; you might turn that setting off for SSD drives, which do not have the same overhead for writing smaller batches of data at random locations.

See also dirty page.

See also extent.

See also flush.

See also page.

next-key lock

A combination of a **record lock** on the index record and a gap lock on the gap before the index record.

See also gap lock.

See also locking.

See also record lock.

non-blocking I/O

An industry term that means the same as **asynchronous I/O**.

See also asynchronous I/O.

non-repeatable read

The situation when a query retrieves data, and a later query within the same **transaction** retrieves what should be the same data, but the queries return different results (changed by another transaction committing in the meantime).

This kind of operation goes against the **ACID** principle of database design. Within a transaction, data should be consistent, with predictable and stable relationships.

Among different **isolation levels**, non-repeatable reads are prevented by the **serializable read** and **repeatable read** levels, and allowed by the **consistent read**, and **read uncommitted** levels.

See also ACID.

See also consistent read.

See also isolation level.

See also READ UNCOMMITTED.

See also REPEATABLE READ.

See also SERIALIZABLE.

See also transaction.

normalized

A database design strategy where data is split into multiple tables, and duplicate values condensed into single rows represented by an ID, to avoid storing, querying, and updating redundant or lengthy values. It is typically used in **OLTP** applications.

For example, an address might be given a unique ID, so that a census database could represent the relationship **lives at this address** by associating that ID with each member of a family, rather than storing multiple copies of a complex value such as **123 Main Street, Anytown, USA**.

For another example, although a simple address book application might store each phone number in the same table as a person's name and address, a phone company database might give each phone number a special ID, and store the numbers and IDs in a separate table. This normalized representation could simplify large-scale updates when area codes split apart.

Normalization is not always recommended. Data that is primarily queried, and only updated by deleting entirely and reloading, is often kept in fewer, larger tables with redundant copies of duplicate values. This data representation is referred to as **denormalized**, and is frequently found in data warehousing applications.

See also denormalized.

See also foreign key.

See also OLTP.

See also relational.

NOT NULL constraint

A type of **constraint** that specifies that a **column** cannot contain any **NULL** values. It helps to preserve **referential integrity**, as the database server can identify data with erroneous missing values. It also helps in the arithmetic involved in query optimization, allowing the optimizer to predict the number of entries in an index on that column.

See also column.

See also constraint.

See also NULL.

See also primary key.

See also referential integrity.

NULL

A special value in **SQL**, indicating the absence of data. Any arithmetic operation or equality test involving a `NULL` value, in turn produces a `NULL` result. (Thus it is similar to the IEEE floating-point concept of NaN, “not a number”.) Any aggregate calculation such as `AVG()` ignores rows with `NULL` values, when determining how many rows to divide by. The only test that works with `NULL` values uses the SQL idioms `IS NULL` or `IS NOT NULL`.

`NULL` values play a part in index operations, because for performance a database must minimize the overhead of keeping track of missing data values. Typically, `NULL` values are not stored in an index, because a query that tests an indexed column using a standard comparison operator could never match a row with a `NULL` value for that column. For the same reason, unique indexes do not prevent `NULL` values; those values simply are not represented in the index. Declaring a `NOT NULL` constraint on a column provides reassurance that there are no rows left out of the index, allowing for better query optimization (accurate counting of rows and estimation of whether to use the index).

Because the **primary key** must be able to uniquely identify every row in the table, a single-column primary key cannot contain any `NULL` values, and a multi-column primary key cannot contain any rows with `NULL` values in all columns.

Although the Oracle database allows a `NULL` value to be concatenated with a string, InnoDB treats the result of such an operation as `NULL`.

See also index.

See also primary key.

See also SQL.

O

off-page column

A column containing variable-length data (such as `BLOB` and `VARCHAR`) that is too long to fit on a **B-tree** page. The data is stored in **overflow pages**. The `DYNAMIC` row format in the InnoDB **Barracuda** file format is more efficient for such storage than the older `COMPACT` row format.

See also B-tree.

See also Barracuda.

See also overflow page.

OLTP

Acronym for “Online Transaction Processing”. A database system, or a database application, that runs a workload with many **transactions**, with frequent writes as well as reads, typically affecting small amounts of data at a time. For example, an airline reservation system or an application that processes bank deposits. The data might be organized in **normalized** form for a balance between **DML** (insert/update/delete) efficiency and **query** efficiency. Contrast with **data warehouse**.

With its **row-level locking** and **transactional** capability, **InnoDB** is the ideal storage engine for MySQL tables used in OLTP applications.

See also data warehouse.

See also DML.

See also InnoDB.

See also query.

See also row lock.

See also transaction.

online

A type of operation that involves no downtime, blocking, or restricted operation for the database. Typically applied to **DDL**. Operations that shorten the periods of restricted operation, such as **fast index creation**, are a step along the way to true online DDL. A **hot backup** is an online operation and a **warm backup** is partially an online operation.

See also DDL.

See also Fast Index Creation.

See also hot backup.

See also warm backup.

.OPT file

A file containing database configuration information. Files with this extension are always included in backups produced by the `mysqlbackup` command of the **MySQL Enterprise Backup** product.

See also MySQL Enterprise Backup.

See also mysqlbackup command.

optimistic

A methodology that guides low-level implementation decisions for a relational database system. The requirements of performance and **concurrency** in a relational database mean that operations must be started or dispatched quickly. The requirements of consistency and **referential integrity** mean that any operation could fail: a transaction might be rolled back, a **DML** operation could violate a constraint, a request for a lock could cause a deadlock, a network error could cause a timeout. An optimistic strategy is one that assumes most requests or attempts will succeed, so that relatively little work is done to prepare for the failure case. When this assumption is true, the database does little unnecessary work; when requests do fail, extra work must be done to clean up and undo changes.

InnoDB uses optimistic strategies for operations such as **locking** and **commits**. For example, data changed by a transaction can be written to the data files before the commit occurs, making the commit itself very fast, but requiring more work to undo the changes if the transaction is rolled back.

The opposite of an optimistic strategy is a **pessimistic** one, where a system is optimized to deal with operations that are unreliable and frequently unsuccessful. This methodology is rare in a database system, because so much care goes into choosing reliable hardware, networks, and algorithms.

See also commit.

See also concurrency.

See also DML.

See also locking.

See also pessimistic.

optimizer

The MySQL component that determines the best **indexes** and **join** order to use for a **query**, based on characteristics and data distribution of the relevant **tables**.

See also index.

See also join.

See also query.

See also table.

option

A configuration parameter for MySQL, either stored in the **option file** or passed on the command line.

In the context of the **InnoDB** storage engine (either the built-in InnoDB or the InnoDB Plugin), each option name starts with the prefix `innodb_`.

See also InnoDB.

See also option file.

option file

The file that holds the configuration **options** for the MySQL instance. Traditionally, on Linux and UNIX this file is named `my.cnf`, and on Windows it is named `my.ini`.

See also configuration file.

See also my.cnf.

See also option.

overflow page

Separately allocated disk **pages** that hold variable-length columns (such as `BLOB` and `VARCHAR`) that are too long to fit on a **B-tree** page. The associated columns are known as **off-page columns**.

See also B-tree.

See also off-page column.

See also page.

P

page

A unit representing how much data InnoDB transfers at any one time between disk (the **data files**) and memory (the **buffer pool**). A page can contain one or more **rows**, depending on how much data is in each row. If a row does not fit entirely into a single page, InnoDB sets up additional pointer-style data structures so that the information about the row can be stored in one page.

One way to fit more data in each page is to use **compressed row format**. For tables that use BLOBs or large text fields, **compact row format** allows those large columns to be stored separately from the rest of the row, reducing I/O overhead and memory usage for queries that do not reference those columns.

When InnoDB reads or writes sets of pages as a batch to increase I/O throughput, it reads or writes an **extent** at a time.

All the InnoDB disk data structures within a MySQL instance share the same **page size**.

See also buffer pool.

See also compact row format.

See also compressed row format.

See also data files.

See also extent.

See also page size.

See also row.

page cleaner

An InnoDB background **thread** that **flushes dirty pages** from the **buffer pool**. Prior to MySQL 5.6, this activity was performed by the **master thread**

See also buffer pool.

See also dirty page.

See also flush.

See also master thread.

See also thread.

page size

For releases up to and including MySQL 5.5, the size of each InnoDB **page** is fixed at 16 kilobytes. This value represents a balance: large enough to hold the data for most rows, yet small enough to minimize the performance overhead of transferring unneeded data to memory. Other values are not tested or supported.

Starting in MySQL 5.6, the page size for an InnoDB **instance** can be either 4KB, 8KB, or 16KB, controlled by the `innodb_page_size` configuration option. You set the size when creating the MySQL instance, and it remains constant afterwards. The same page size applies to all InnoDB **tablespaces**, both the **system tablespace** and any separate tablespaces created in **file-per-table** mode.

Smaller page sizes can help performance with storage devices that use small block sizes, particularly for **SSD** devices in **disk-bound** workloads, such as for **OLTP** applications. As individual rows are updated, less data is copied into memory, written to disk, reorganized, locked, and so on.

See also disk-bound.

See also file-per-table.

See also instance.

See also OLTP.

See also page.

See also SSD.

See also system tablespace.

See also tablespace.

.PAR file

A file containing partition definitions. Files with this extension are always included in backups produced by the `mysqlbackup` command of the **MySQL Enterprise Backup** product.

See also MySQL Enterprise Backup.

See also mysqlbackup command.

parent table

The table in a **foreign key** relationship that holds the initial column values pointed to from the **child table**. The consequences of deleting, or updating rows in the parent table depend on the `ON UPDATE` and `ON DELETE` clauses in the foreign key definition. Rows with corresponding values in the child table could be automatically deleted or updated in turn, or those columns could be set to `NULL`, or the operation could be prevented.

See also child table.

See also foreign key.

partial backup

A **backup** that contains some of the **tables** in a MySQL database, or some of the databases in a MySQL instance. Contrast with **full backup**.

See also backup.

See also full backup.

See also table.

partial index

An **index** that represents only part of a column value, typically the first N characters (the **prefix**) of a long `VARCHAR` value.

See also index.

See also index prefix.

Performance Schema

The `performance_schema` schema, in MySQL 5.5 and up, presents a set of tables that you can query to get detailed information about the performance characteristics of many internal parts of the MySQL server.

See also latch.

See also mutex.

See also rw-lock.

persistent statistics

A feature in MySQL 5.6 that stores **index** statistics for InnoDB **tables** on disk, providing better **plan stability** for **queries**. The statistics are recalculated only by running the `ALTER TABLE` statement.

See also index.

See also optimizer.

See also plan stability.

See also query.

See also table.

pessimistic

A methodology that sacrifices performance or concurrency in favor of safety. It is appropriate if a high proportion of requests or attempts might fail, or if the consequences of a failed request are severe. InnoDB uses what is known as a pessimistic **locking** strategy, to minimize the chance of **deadlocks**. At the application level, you might avoid deadlocks by using a pessimistic strategy of acquiring all locks needed by a transaction at the very beginning.

Many built-in database mechanisms use the opposite **optimistic** methodology.

See also deadlock.

See also locking.

See also optimistic.

phantom

A row that appears in the result set of a query, but not in the result set of an earlier query. For example, if a query is run twice within a **transaction**, and in the meantime, another transaction commits after inserting a new row or updating a row so that it matches the `WHERE` clause of the query.

This occurrence is known as a phantom read. It is harder to guard against than a **non-repeatable read**, because locking all the rows from the first query result set does not prevent the

changes that cause the phantom to appear.

Among different **isolation levels**, phantom reads are prevented by the **serializable read** level, and allowed by the **repeatable read**, **consistent read**, and **read uncommitted** levels.

See also consistent read.

See also isolation level.

See also non-repeatable read.

See also READ UNCOMMITTED.

See also REPEATABLE READ.

See also SERIALIZABLE.

See also transaction.

physical

A type of operation that involves hardware-related aspects such as disk blocks, memory pages, files, bits, disk reads, and so on. Typically, physical aspects are important during expert-level performance tuning and problem diagnosis. Contrast with **logical**.

See also logical.

See also physical backup.

physical backup

A **backup** that copies the actual data files. For example, the `mysqlbackup` command of the **MySQL Enterprise Backup** product produces a physical backup, because its output contains data files that can be used directly by the `mysqld` server, resulting in a faster **restore** operation. Contrast with **logical backup**.

See also backup.

See also logical backup.

See also MySQL Enterprise Backup.

See also restore.

PITR

Acronym for **point-in-time recovery**.

See also point-in-time recovery.

plan stability

A property of a **query execution plan**, where the optimizer makes the same choices each time for a given **query**, so that performance is consistent and predictable.

See also query.

See also query execution plan.

plugin

In MySQL 5.1 and earlier, a separately installable form of the **InnoDB** storage engine that includes features and performance enhancements not included in the **built-in** InnoDB for those releases.

For MySQL 5.5 and higher, the MySQL distribution includes the very latest InnoDB features and performance enhancements, known as InnoDB 1.1, and there is no longer a separate InnoDB Plugin.

This distinction is important mainly in MySQL 5.1, where a feature or bug fix might apply to the InnoDB Plugin but not the built-in InnoDB, or vice versa.

See also built-in.

See also InnoDB.

point-in-time recovery

The process of restoring a **backup** to recreate the state of the database at a specific date and time. Commonly abbreviated **PITR**. Because it is unlikely that the specified time corresponds exactly to the time of a backup, this technique usually requires a combination of a **physical backup** and a **logical backup**. For example, with the **MySQL Enterprise Backup** product, you restore the last backup that you took before the specified point in time, then replay changes

from the **binary log** between the time of the backup and the PITR time.

See also backup.

See also logical backup.

See also MySQL Enterprise Backup.

See also physical backup.

See also PITR.

prefix

See index prefix.

prepared backup

A set of backup files, produced by the **MySQL Enterprise Backup** product, after all the stages of applying **binary logs** and **incremental backups** are finished. The resulting files are ready to be **restored**. Prior to the apply steps, the files are known as a **raw backup**.

See also binary log.

See also hot backup.

See also incremental backup.

See also MySQL Enterprise Backup.

See also raw backup.

See also restore.

primary key

A set of columns -- and by implication, the index based on this set of columns -- that can uniquely identify every row in a table. As such, it must be a unique index that does not contain any `NULL` values.

InnoDB requires that every table has such an index (also called the **clustered index** or **cluster index**), and organizes the table storage based on the column values of the primary key.

See also clustered index.

See also index.

process

An instance of an executing program. The operating switches between multiple running processes, allowing for a certain degree of **concurrency**. On most operating systems, processes can contain multiple **threads** of execution that share resources. Context-switching between threads is faster than the equivalent switching between processes.

See also concurrency.

See also thread.

pseudo-record

An artificial record in an index, used for **locking** key values or ranges that do not currently exist.

See also infimum record.

See also locking.

See also supremum record.

Pthreads

The POSIX threads standard, which defines an API for threading and locking operations on UNIX and Linux systems. On UNIX and Linux systems, InnoDB uses this implementation for **mutexes**.

See also mutex.

purge

A type of garbage collection performed by a separate thread, running on a periodic schedule. The purge includes these actions: removing obsolete values from indexes; physically removing rows that were marked for deletion by previous `DELETE` statements.

See also crash recovery.

See also delete.

See also doublewrite buffer.

purge buffering

The technique of storing index changes due to `DELETE` operations in the **insert buffer** rather than writing them immediately, so that the physical writes can be performed to minimize random I/O. (Because delete operations are a two-step process, this operation buffers the write that normally purges an index record that was previously marked for deletion.) It is one of the types of **change buffering**; the others are **insert buffering**. and **delete buffering**

See also change buffering.

See also delete buffering.

See also insert buffer.

See also insert buffering.

purge thread

A **thread** within the InnoDB process that is dedicated to performing the periodic **purge** operation.

See also purge.

See also thread.

Q

query

In **SQL**, an operation that reads information from one or more **tables**. Depending on the organization of data and the parameters of the query, the lookup might be optimized by consulting an **index**. If multiple tables are involved, the query is known as a **join**.

For historical reasons, sometimes discussions of internal processing for statements use “query” in a broader sense, including other types of MySQL statements such as **DDL** and **DML** statements.

See also DDL.

See also DML.

See also index.

See also join.

See also SQL.

See also table.

query execution plan

The set of decisions made by the optimizer about how to perform a **query** most efficiently, including which **index** or indexes to use, and the order in which to **join** tables. **Plan stability** involves the same choices being made consistently for a given query.

See also index.

See also join.

See also plan stability.

See also query.

query log

See general query log.

R

RAID

Acronym for “Redundant Array of Inexpensive Drives”. Spreading I/O operations across multiple drives enables greater **concurrency** at the hardware level, and improves the efficiency of low-level write operations that otherwise would be performed in sequence.

See also concurrency.

random dive

A technique for quickly estimating the number of different values in a column (the column's cardinality). InnoDB samples pages at random from the index and uses that data to estimate the number of different values. This operation occurs when each table is first opened.

Originally, the number of sampled pages was fixed at 8; now, it is determined by the setting of the `innodb_stats_sample_pages` parameter.

The way the random pages are picked depends on the setting of the innodb_use_legacy_cardinality_algorithm parameter. The default setting (OFF) has better randomness than in older releases.

See also cardinality.

raw backup

The initial set of backup files produced by the **MySQL Enterprise Backup** product, before the changes reflected in the **binary log** and any **incremental backups** are applied. At this stage, the files are not ready to **restore**. After these changes are applied, the files are known as a **prepared backup**.

See also binary log.

See also hot backup.

See also ibbackup_logfile.

See also incremental backup.

See also MySQL Enterprise Backup.

See also prepared backup.

See also restore.

READ COMMITTED

An **isolation level** that uses a **locking** strategy that relaxes some of the protection between **transactions**, in the interest of performance. Transactions cannot see uncommitted data from other transactions, but they can see data that is committed by another transaction after the current transaction started. Thus, a transaction never sees any bad data, but the data that it does see may depend to some extent on the timing of other transactions.

When a transaction with this isolation level performs `UPDATE ... WHERE` or `DELETE ... WHERE` operations, other transactions might have to wait. The transaction can perform `SELECT ... FOR UPDATE`, and `LOCK IN SHARE MODE` operations without making other transactions wait.

See also ACID.

See also isolation level.

See also locking.

See also REPEATABLE READ.

See also SERIALIZABLE.

See also transaction.

READ UNCOMMITTED

The **isolation level** that provides the least amount of protection between transactions. Queries employ a **locking** strategy that allows them to proceed in situations where they would normally wait for another transaction. However, this extra performance comes at the cost of less reliable results, including data that has been changed by other transactions and not committed yet (known as **dirty read**). Use this isolation level only with great caution, and be aware that the results might not be consistent or reproducible, depending on what other transactions are doing at the same time. Typically, transactions with this isolation level do only queries, not insert, update, or delete operations.

See also ACID.

See also dirty read.

See also isolation level.

See also locking.

See also transaction.

read view

An internal snapshot used by the **MVCC** mechanism of InnoDB. Certain **transactions**, depending on their **isolation level**, see the data values as they were at the time the transaction (or in some cases, the statement) started. Isolation levels that use a read view are **REPEATABLE READ**, **READ COMMITTED**, and **READ UNCOMMITTED**.

See also isolation level.

See also MVCC.

See also READ COMMITTED.

See also READ UNCOMMITTED.

See also REPEATABLE READ.

See also transaction.

read-ahead

A type of I/O request that prefetches a group of **pages** (an entire **extent**) into the **buffer pool** asynchronously, in anticipation that these pages will be needed soon. The linear read-ahead technique prefetches all the pages of one extent based on access patterns for pages in the preceding extent, and is part of all MySQL versions starting with the InnoDB Plugin for MySQL 5.1. The random read-ahead technique prefetches all the pages for an extent once a certain number of pages from the same extent are in the buffer pool. Random read-ahead is not part of MySQL 5.5, but is re-introduced in MySQL 5.6 under the control of the `innodb_random_read_ahead` configuration option.

See also buffer pool.

See also extent.

See also page.

record lock

A lock on an index record. For example, `SELECT c1 FOR UPDATE FROM t WHERE c1 = 10;` prevents any other transaction from inserting, updating, or deleting rows where the value of `t.c1` is 10. Contrast with **gap lock** and **next-key lock**.

See also gap lock.

See also lock.

See also next-key lock.

redo log

A set of files, typically named `ib_logfile0` and `ib_logfile1`, that record statements that attempt to change data in InnoDB tables. These statements are replayed automatically to correct data written by incomplete **transactions**, on startup following a **crash**. The passage of data through the redo logs is represented by the ever-increasing **LSN** value. The 4GB limit on maximum size for the redo log is raised in MySQL 5.6.

The disk layout of the redo log is influenced by the configuration options `innodb_log_file_size`, `innodb_log_group_home_dir`, and (rarely) `innodb_log_files_in_group`. The performance of redo log operations is also affected by the **log buffer**, which is controlled by the `innodb_log_buffer_size` configuration option.

See also crash recovery.

See also ib_logfile.

See also log buffer.

See also LSN.

See also transaction.

redundant row format

The oldest InnoDB row format, available for tables using the **Antelope file format**. Prior to MySQL 5.0.3, it was the only row format available in InnoDB. In My SQL 5.0.3 and later, the default is **compact row format**. You can still specify redundant row format for compatibility with older InnoDB tables.

See also Antelope.

See also compact row format.

See also file format.

See also row format.

referential integrity

The technique of maintaining data always in a consistent format, part of the **ACID** philosophy. In particular, data in different tables is kept consistent through the use of **foreign key constraints**, which can prevent changes from happening or automatically propagate those changes to all related tables. Related mechanisms include the **unique constraint**, which prevents duplicate values from being inserted by mistake, and the **NOT NULL constraint**, which prevents blank values from being inserted by mistake.

See also ACID.

See also FOREIGN KEY constraint.

See also NOT NULL constraint.

See also unique constraint.

relational

An important aspect of modern database systems. The database server encodes and enforces relationships such as one-to-one, one-to-many, many-to-one, and uniqueness. For example, a person might have zero, one, or many phone numbers in an address database; a single phone number might be associated with several family members. In a financial database, a person might be required to have exactly one taxpayer ID, and any taxpayer ID could only be associated with one person.

The database server can use these relationships to prevent bad data from being inserted, and to find efficient ways to look up information. For example, if a value is declared to be unique, the server can stop searching as soon as the first match is found, and it can reject attempts to insert a second copy of the same value.

At the database level, these relationships are expressed through SQL features such as **columns** within a table, unique and `NOT NULL` **constraints**, **foreign keys**, and different kinds of join operations. Complex relationships typically involve data split between more than one table. Often, the data is **normalized**, so that duplicate values in one-to-many relationships are stored only once.

In a mathematical context, the relations within a database are derived from set theory. For example, the `OR` and `AND` operators of a `WHERE` clause represent the notions of union and intersection.

See also ACID.

See also constraint.

See also foreign key.

See also normalized.

relevance

In the **full-text search** feature, a number signifying the similarity between the search string and the data in the **FULLTEXT index**. For example, when you search for a single word, that word is typically more relevant for a row where if it occurs several times in the text than a row where it appears only once.

See also full-text search.

See also FULLTEXT index.

REPEATABLE READ

The default **isolation level** for InnoDB. It prevents any rows that are queried from being changed by other transactions, thus blocking **non-repeatable reads** but not **phantom** reads. It uses a moderately strict **locking** strategy so that all queries within a transaction see data from the same snapshot, that is, the data as it was at the time the transaction started.

When a transaction with this isolation level performs `UPDATE ... WHERE`, `DELETE ... WHERE`, `SELECT ... FOR UPDATE`, and `LOCK IN SHARE MODE` operations, other transactions might have to wait.

See also ACID.

See also consistent read.

See also isolation level.

See also locking.

See also phantom.

See also SERIALIZABLE.

See also transaction.

replication

The practice of sending changes from a **master database**, to one or more **slave databases**, so that all databases have the same data. This technique has a wide range of uses, such as load-balancing for better scalability, disaster recovery, and testing software upgrades and configuration changes. The changes can be sent between the database by methods called **row-based replication** and **statement-based replication**.

See also row-based replication.

See also statement-based replication.

restore

The process of putting a set of backup files from the **MySQL Enterprise Backup** product in place for use by MySQL. This operation can be performed to fix a corrupted database, to return to some earlier point in time, or (in a **replication** context) to set up a new **slave database**. In the **MySQL Enterprise Backup** product, this operation is performed by the `copy-back` option of the `mysqlbackup` command.

See also hot backup.

See also MySQL Enterprise Backup.

See also mysqlbackup command.

See also prepared backup.

See also replication.

rollback

A **SQL** statement that ends a **transaction**, undoing any changes made by the transaction. It is the opposite of **commit**, which makes permanent any changes made in the transaction.

By default, MySQL uses the **autocommit** setting, which automatically issues a commit following each SQL statement. You must change this setting before you can use the rollback technique.

See also ACID.

See also commit.

See also transaction.

rollback segment

The storage area containing the **undo log**, part of the **system tablespace**.

See also system tablespace.

See also undo log.

row

The logical data structure defined by a set of **columns**. A set of rows makes up a **table**. Within InnoDB **data files**, each **page** can contain one or more rows.

Although InnoDB uses the term **row format** for consistency with MySQL syntax, the row format is a property of each table and applies to all rows in that table.

See also column.

See also data files.

See also page.

See also row format.

See also table.

row format

The disk storage format for a **row** from an InnoDB **table**. As InnoDB gains new capabilities such as compression, new row formats are introduced to support the resulting improvements in storage efficiency and performance.

Each table has its own row format, specified through the `ROW_FORMAT` option. To see the row format for each InnoDB table, issue the command `SHOW TABLE STATUS`. Because all the tables in the system tablespace share the same row format, to take advantage of other row formats typically requires setting the `innodb_file_per_table` option, so that each table is stored in a separate tablespace.

See also compact row format.

See also compressed row format.

See also dynamic row format.

See also fixed row format.

See also redundant row format.

See also row.

See also table.

row lock

A **lock** that prevents a row from being accessed in an incompatible way by another **transaction**. Other rows in the same table can be freely written to by other transactions. This is the type of **locking** done by **DML** operations on **InnoDB** tables. Contrast with **table locks** used by MyISAM, which block concurrent access to the table.

See also DML.

See also InnoDB.

See also lock.

See also locking.

See also table lock.

See also transaction.

row-based replication

This form of **replication** is safe to use for all settings of the **innodb_autoinc_lock_mode** option.

See also auto-increment locking.

See also innodb_autoinc_lock_mode.

See also replication.

See also statement-based replication.

row-level locking

The **locking** mechanism used for **InnoDB** tables, relying on **row locks** rather than **table locks**. Multiple **transactions** can modify the same table concurrently. Only if two transactions try to modify the same row does one of the transactions wait for the other to complete (and release its row locks).

See also InnoDB.

See also locking.

See also row lock.

See also table lock.

See also transaction.

rw-lock

The low-level object that InnoDB uses to represent and enforce shared-access **locks** to internal in-memory data structures. Once the lock is acquired, any other process, thread, and so on can read the data structure, but no one else can write to it. Contrast with **mutexes**, which enforce ex-

clusive access. Mutexes and rw-locks are known collectively as **latches**.

See also latch.

See also lock.

See also mutex.

See also Performance Schema.

S

savepoint

Savepoints help to implement nested **transactions**. They can be used to provide scope to operations on tables that are part of a larger transaction. For example, scheduling a trip in a reservation system might involve booking several different flights; if a desired flight is unavailable, you might **roll back** the changes involved in booking that one leg, without rolling back the earlier flights that were successfully booked.

See also rollback.

See also transaction.

scalability

The ability to add more work and issue more simultaneous requests to a system, without a sudden drop in performance due to exceeding the limits of system capacity. Software architecture, hardware configuration, application coding, and type of workload all play a part in scalability. When the system reaches its maximum capacity, popular techniques for increasing scalability are **scale up** (increasing the capacity of existing hardware or software) and **scale out** (adding new hardware or more instances of server software).

schema

Conceptually, a schema is a set of interrelated database objects, such as tables, table columns, data types of the columns, indexes, foreign keys, and so on. These objects are connected through SQL syntax, because the columns make up the tables, the foreign keys refer to tables and columns, and so on. Ideally, they are also connected logically, working together as part of a unified application or flexible framework. For example, the **information_schema** and **performance_schema** databases use "schema" in their names to emphasize the close relationships between the tables and columns they contain.

In MySQL, physically, a **schema** is synonymous with a **database**. You can substitute the keyword `SCHEMA` instead of `DATABASE` in MySQL SQL syntax, for example using `CREATE SCHEMA` instead of `CREATE DATABASE`.

Some other database products draw a distinction. For example, in the Oracle Database product, a **schema** represents only a part of a database: the tables and other objects owned by a single user.

See also database.

See also ib-file set.

See also INFORMATION_SCHEMA.

See also Performance Schema.

search index

In MySQL, full-text search queries use a special kind of index, the **FULLTEXT** index. In MySQL 5.6.4 and up, `InnoDB` and `MyISAM` tables both support `FULLTEXT` indexes; formerly, these indexes were only available for `MyISAM` tables.

See also FULLTEXT index.

secondary index

A type of InnoDB **index** that represents a subset of table columns. An InnoDB table can have zero, one, or many secondary indexes. (Contrast with the **clustered index**, which is required for each InnoDB table, and stores the data for all the table columns.)

A secondary index can be used to satisfy queries that only require values from the indexed columns. For more complex queries, it can be used to identify the relevant rows in the table, which are then retrieved through lookups using the clustered index.

Creating and dropping secondary indexes has traditionally involved significant overhead from copying all the data in the InnoDB table. The **fast index creation** feature of the In-

noDB Plugin makes both `CREATE INDEX` and `DROP INDEX` statements much faster for InnoDB secondary indexes.

See also clustered index.

See also Fast Index Creation.

See also index.

segment

A division within an InnoDB **tablespace**. If a tablespace is analogous to a directory, the segments are analogous to files within that directory. A segment can grow. New segments can be created.

For example, within a **file-per-table** tablespace, the table data is in one segment and each associated index is in its own segment. The **system tablespace** contains many different segments, because it can hold many tables and their associated indexes. The system tablespace also includes up to 128 **rollback segments** making up the **undo log**.

Segments grow and shrink as data is inserted and deleted. When a segment needs more room, it is extended by one **extent** (1 megabyte) at a time. Similarly, a segment releases one extent's worth of space when all the data in that extent is no longer needed.

See also extent.

See also file-per-table.

See also rollback segment.

See also system tablespace.

See also tablespace.

See also undo log.

selectivity

A property of data distribution, the number of distinct values in a column (its **cardinality**) divided by the number of records in the table. High selectivity means that the column values are relatively unique, and can retrieved efficiently through an index. If you (or the query optimizer) can predict that a test in a `WHERE` clause only matches a small number (or proportion) of rows in a table, the overall **query** tends to be efficient if it evaluates that test first, using an index.

See also cardinality.

See also query.

semi-consistent read

A type of read operation used for `UPDATE` statements, that is a combination of **read committed** and **consistent read**. When an `UPDATE` statement examines a row that is already locked, InnoDB returns the latest committed version to MySQL so that MySQL can determine whether the row matches the `WHERE` condition of the `UPDATE`. If the row matches (must be updated), MySQL reads the row again, and this time InnoDB either locks it or waits for a lock on it. This type of read operation can only happen when the transaction has the read committed **isolation level**, or when the `innodb_locks_unsafe_for_binlog` option is enabled.

See also consistent read.

See also isolation level.

See also READ COMMITTED.

SERIALIZABLE

The **isolation level** that uses the most conservative locking strategy, to prevent any other transactions from inserting or changing data that was read by this transaction, until it is finished. This way, the same query can be run over and over within a transaction, and be certain to retrieve the same set of results each time. Any attempt to change data that was committed by another transaction since the start of the current transaction, cause the current transaction to wait.

This is the default isolation level specified by the SQL standard. In practice, this degree of strictness is rarely needed, so the default isolation level for InnoDB is the next most strict, **repeatable read**.

See also ACID.

See also consistent read.

See also isolation level.

See also locking.

See also REPEATABLE READ.

See also transaction.

server

A type of program that runs continuously, waiting to receive and act upon requests from another program (the client). Because often an entire computer is dedicated to running one or more server programs (such as a database server, a web server, an application server, or some combination of these), the term **server** can also refer to the computer that runs the server software.

See also client.

See also mysqld.

shared lock

A kind of **lock** that allows other **transactions** to read the locked object, and to also acquire other shared locks on it, but not to write to it. The opposite of **exclusive lock**.

See also exclusive lock.

See also lock.

See also transaction.

shared tablespace

Another way of referring to the **system tablespace**.

See also system tablespace.

sharp checkpoint

The process of **flushing** to disk all **dirty** buffer pool pages whose redo entries are contained in certain portion of the **redo log**. Occurs before InnoDB reuses a portion of a log file; the log files are used in a circular fashion. Typically occurs with write-intensive **workloads**.

See also dirty page.

See also flush.

See also redo log.

See also workload.

shutdown

The process of stopping the MySQL server. By default, this process does cleanup operations for **InnoDB** tables, so it can **slow** to shut down, but fast to start up later. If you skip the cleanup operations, it is **fast** to shut down but must do the cleanup during the next restart.

The shutdown mode is controlled by the `innodb_fast_shutdown` option.

See also fast shutdown.

See also InnoDB.

See also slow shutdown.

slave server

Frequently shortened to “slave”. A database **server** machine in a **replication** scenario that receives changes from another server (the **master**) and applies those same changes. Thus it maintains the same contents as the master, although it might lag somewhat behind.

In MySQL, slave servers are commonly used in disaster recovery, to take the place of a master servers that fails. They are also commonly used for testing software upgrades and new settings, to ensure that database configuration changes do not cause problems with performance or reliability.

Slave servers typically have high workloads, because they process all the **DML** (write) operations relayed from the master, as well as user queries. To ensure that slave servers can apply changes from the master fast enough, they frequently have fast I/O devices and sufficient

CPU and memory to run multiple database instances on the same slave server. For example, the master server might use hard drive storage while the slave servers use **SSD**s.

See also DML.

See also replication.

See also server.

See also SSD.

slow query log

A type of **log** used for performance tuning of SQL statements processed by the MySQL server. The log information is stored in a file. You must enable this feature to use it. You control which categories of "slow" SQL statements are logged. For more information, see Section 5.2.5, "The Slow Query Log".

See also general query log.

See also log.

slow shutdown

A type of shutdown that does additional flushing operations before completing. Specified by the configuration parameter `innodb_fast_shutdown=0` or the command `SET GLOBAL innodb_fast_shutdown=0;`. Although the shutdown itself can take longer, that time will be saved on the subsequent startup.

See also fast shutdown.

See also shutdown.

snapshot

A representation of data at a particular time, which remains the same even as changes are **committed** by other **transactions**. Used by certain **isolation levels** to allow **consistent reads**.

See also commit.

See also consistent read.

See also isolation level.

See also transaction.

spin

A type of **wait** operation that continuously tests whether a resource becomes available. This technique is used for resources that are typically held only for brief periods, where it is more efficient to wait in a "busy loop" than to put the thread to sleep and perform a context switch. If the resource does not become available within a short time, the spin loop ceases and another wait technique is used.

See also latch.

See also lock.

See also mutex.

See also wait.

SQL

The Structured Query Language that is standard for performing database operations. Often divided into the categories **DDL**, **DML**, and **queries**.

See also DDL.

See also DML.

See also query.

SSD

Acronym for "solid-state drive". A type of storage device with different performance characteristics than a traditional hard disk drive (**HDD**): smaller storage capacity, faster for random reads, no moving parts, and with a number of considerations affecting write performance. Its performance characteristics can influence the throughput of a **disk-based** workload.

See also disk-based.

See also SSD.

statement-based replication

This form of **replication** requires some care with the setting for the **innodb_autoinc_lock_mode** option, to avoid potential timing problems with **auto-increment locking**.

See also auto-increment locking.

See also innodb_autoinc_lock_mode.

See also replication.

See also row-based replication.

stemming

The ability to search for different variations of a word based on a common root word, such as singular and plural, or past, present, and future verb tense. This feature is currently supported in MyISAM **full-text search** feature but not in **FULLTEXT indexes** for InnoDB tables.

See also full-text search.

See also FULLTEXT index.

stopword

In a **FULLTEXT index**, a word that is considered common or trivial enough that it is omitted from the **search index** and ignored in search queries. Different configuration settings control stopword processing for `InnoDB` and `MyISAM` tables.

See also FULLTEXT index.

See also search index.

storage engine

A component of the MySQL database that performs the low-level work of storing, updating, and querying data. **InnoDB** is one such storage engine. Different storage engines are designed with different tradeoffs between factors such as memory usage versus disk usage, read speed versus write speed, and speed versus robustness. Each storage engine has an associated **table type**, so we refer to `InnoDB` tables, `MyISAM` tables, and so on.

The **MySQL Enterprise Backup** product is optimized for backing up tables produced by the **InnoDB** storage engine. It can also back up tables produced by MyISAM and other storage engines.

See also InnoDB.

See also MySQL Enterprise Backup.

See also table type.

strict mode

The general name for the setting controlled by the `innodb_strict_mode` option. Turning on this setting causes certain conditions that are normally treated as warnings, to be considered errors. For example, certain invalid combinations of options related to **file format** and **row format**, that normally produce a warning and continue with default values, now cause the `CREATE TABLE` operation to fail.

MySQL also has something called strict mode.

See also file format.

See also innodb_strict_mode.

See also row format.

sublist

Within the list structure that represents the buffer pool, pages that are relatively old and relatively new are represented by different portions of the list. A set of parameters control the size of these portions and the dividing point between the new and old pages.

See also buffer pool.

See also eviction.

See also list.

See also LRU.

supremum record

A **pseudo-record** in an index, representing the **gap** above the largest value in that index. If a transaction has a statement such as `SELECT ... FOR UPDATE ... WHERE col > 10;`, and the largest value in the column is 20, it is a lock on the supremum record that prevents other transactions from inserting even larger values such as 50, 100, and so on.

See also gap.

See also infimum record.

See also pseudo-record.

system tablespace

By default, this single data file stores all the table data for a database, as well as all the metadata for InnoDB-related objects (the **data dictionary**).

Turning on the **innodb_file_per_table** option causes each newly created table to be stored in its own **tablespace**, reducing the size of, and dependencies on, the system tablespace.

In MySQL 5.6 and higher, setting a value for the `innodb_undo_tablespaces` option splits the **undo log** into one or more separate tablespace files. These files are still considered part of the system tablespace.

Keeping all table data in the system tablespace has implications for the **MySQL Enterprise Backup** product (backing up one large file rather than several smaller files), and prevents you from using certain InnoDB features that require the newer **file format** known as **Barracuda**.

See also Barracuda.

See also data dictionary.

See also file format.

See also file-per-table.

See also ibdata file.

See also innodb_file_per_table.

See also MySQL Enterprise Backup.

See also tablespace.

See also undo log.

T

table

Each MySQL table is associated with a particular **storage engine**. **InnoDB** tables have particular **physical** and **logical** characteristics that affect performance, **scalability**, **backup**, administration, and application development.

In terms of file storage, each InnoDB table is either part of the single big InnoDB **system tablespace**, or in a separate `.ibd` file if the table is created in **file-per-table** mode. The `.ibd` file holds data for the table and all its **indexes**, and is known as a **tablespace**.

InnoDB tables created in file-per-table mode can use the **Barracuda** file format. Barracuda tables can use the **DYNAMIC row format** or the **COMPRESSED row format**. These relatively new settings enable a number of InnoDB features, such as **compression**, **fast index creation**, and **off-page columns**

For backward compatibility with MySQL 5.1 and earlier, InnoDB tables inside the system tablespace must use the **Antelope** file format, which supports the **compact row format** and the **redundant row format**.

The **rows** of an InnoDB table are organized into an index structure known as the **clustered index**, with entries sorted based on the **primary key** columns of the table. Data access is optimized for queries that filter and sort on the primary key columns, and each index contains a copy of the as-

sociated primary key columns for each entry. Modifying values for any of the primary key columns is an expensive operation. Thus an important aspect of InnoDB table design is choosing a primary key with columns that are used in the most important queries, and keeping the primary key short, with rarely changing values.

See also Antelope.

See also backup.

See also Barracuda.

See also clustered index.

See also compact row format.

See also compressed row format.

See also compression.

See also dynamic row format.

See also Fast Index Creation.

See also file-per-table.

See also .ibd file.

See also index.

See also off-page column.

See also primary key.

See also redundant row format.

See also row.

See also system tablespace.

See also tablespace.

table lock

A lock that prevents any other **transaction** from accessing a table. InnoDB makes considerable effort to make such locks unnecessary, by using techniques such as **row locks** and **consistent reads** for processing **DML** statements and **queries**. You can create such a lock through SQL using the `LOCK TABLE` statement; one of the steps in migrating from other database systems or MySQL storage engines is to remove such statements wherever practical.

See also consistent read.

See also DML.

See also lock.

See also locking.

See also query.

See also row lock.

See also table.

See also transaction.

table scan

See full table scan.

table type

Obsolete synonym for **storage engine**. We refer to `InnoDB` tables, `MyISAM` tables, and so on.

See also InnoDB.

See also storage engine.

tablespace

A data file that can hold data for one or more tables. The **system tablespace** contains the tables

that make up the **data dictionary**, and by default holds all the other InnoDB tables. Turning on the `innodb_file_per_table` option allows newly created tables to each have their own tablespace, with a separate data file for each table.

Tablespaces created by the built-in InnoDB storage engine are upward compatible with the InnoDB Plugin. Tablespaces created by the InnoDB Plugin are downward compatible with the built-in InnoDB storage engine, if they use the **Antelope** file format.

See also Antelope.

See also Barracuda.

See also compressed row format.

See also data dictionary.

See also file-per-table.

See also ibdata file.

See also innodb_file_per_table.

See also system tablespace.

tablespace dictionary

A representation of the **data dictionary** metadata for a table, within the InnoDB **tablespace**. This metadata can be checked against the **.frm file** for consistency when the table is opened, to diagnose errors resulting from out-of-date `.frm` files. This information is present for InnoDB tables that are part of the **system tablespace**, as well as for tables that have their own **.ibd file** because of the **file-per-table** option.

See also data dictionary.

See also file-per-table.

See also .frm file.

See also .ibd file.

See also system tablespace.

See also tablespace.

temporary table

A table whose data does not need to be truly permanent. For example, temporary tables might be used as storage areas for intermediate results in complicated calculations or transformations; this intermediate data would not need to be recovered after a crash. Database products can take various shortcuts to improve the performance of operations on temporary tables, by being less scrupulous about writing data to disk and other measures to protect the data across restarts.

Sometimes, the data itself is removed automatically at a set time, such as when the transaction ends or when the session ends. With some database products, the table itself is removed automatically too.

See also table.

text collection

The set of columns included in a **FULLTEXT index**.

See also FULLTEXT index.

thread

A unit of processing that is typically more lightweight than a **process**, allowing for greater **concurrency**.

See also concurrency.

See also master thread.

See also process.

See also Pthreads.

torn page

An error condition that can occur due to a combination of I/O device configuration and hardware failure. If data is written out in chunks smaller than the InnoDB **page size** (by default, 16KB), a

hardware failure while writing could result in only part of a page being stored to disk. The InnoDB **doublewrite buffer** guards against this possibility.

See also doublewrite buffer.

TPS

Acronym for "**transactions** per second", a unit of measurement sometimes used in benchmarks. Its value depends on the **workload** represented by a particular benchmark test, combined with factors that you control such as the hardware capacity and database configuration.

See also transaction.

See also workload.

transaction

Transactions are atomic units of work that can be committed or rolled back. When a transaction makes multiple changes to the database, either all the changes succeed when the transaction is committed, or all the changes are undone when the transaction is rolled back.

Database transactions, as implemented by InnoDB, have properties that are collectively known by the acronym **ACID**, for atomicity, consistency, isolation, and durability.

See also ACID.

See also commit.

See also isolation level.

See also lock.

See also rollback.

transaction ID

An internal field associated with each row. This field is physically changed by INSERT, UPDATE, and DELETE operations to record which transaction has locked the row.

See also implicit row lock.

.TRG file

A file containing **trigger** parameters. Files with this extension are always included in backups produced by the `mysqlbackup` command of the **MySQL Enterprise Backup** product.

See also MySQL Enterprise Backup.

See also mysqlbackup command.

See also .TRN file.

.TRN file

A file containing trigger namespace information. Files with this extension are always included in backups produced by the `mysqlbackup` command of the **MySQL Enterprise Backup** product.

See also MySQL Enterprise Backup.

See also mysqlbackup command.

See also .TRG file.

troubleshooting

Resources for troubleshooting InnoDB reliability and performance issues include: the Information Schema tables.

truncate

A **DDL** operation that removes the entire contents of a table, while leaving the table and related indexes intact. Contrast with **drop**. Although conceptually it has the same result as a `DELETE` statement with no `WHERE` clause, it operates differently behind the scenes: InnoDB creates a new empty table, drops the old table, then renames the new table to take the place of the old one. Because this is a DDL operation, it cannot be **rolled back**.

If the table being truncated contains foreign keys that reference another table, the truncation operation uses a slower method of operation, deleting one row at a time so that corresponding rows in the referenced table can be deleted as needed by any `ON DELETE CASCADE` clause. (MySQL 5.5 and higher do not allow this slower form of truncate, and return an error instead if foreign keys are involved. In this case, use a `DELETE` statement instead.

See also DDL.

See also drop.

See also foreign key.

See also rollback.

tuple

A technical term designating an ordered set of elements. It is an abstract notion, used in formal discussions of database theory. In the database field, tuples are usually represented by the columns of a table row. They could also be represented by the result sets of queries, for example, queries that retrieved only some columns of a table, or columns from joined tables.

See also cursor.

two-phase commit

An operation that is part of a distributed **transaction**, under the **XA** specification. (Sometimes abbreviated as 2PC.) When multiple databases participate in the transaction, either all databases **commit** the changes, or all databases **roll back** the changes.

See also commit.

See also rollback.

See also transaction.

See also XA.

U

undo

Data that is maintained throughout the life of a **transaction**, recording all changes so that they can be undone in case of a **rollback** operation.

See also rollback.

See also transaction.

See also undo log.

undo buffer

See undo log.

undo log

A storage area that holds copies of data modified by active **transactions**. If another transaction needs to see the original data (as part of a **consistent read** operation), the unmodified data is retrieved from this storage area. This area is physically part of the **system tablespace**. It is split into separate portions, the **insert undo buffer** and the **update undo buffer**. Collectively, these parts are also known as the **rollback segment**, a familiar term for Oracle DBAs.

See also consistent read.

See also rollback segment.

See also system tablespace.

See also transaction.

unique constraint

A kind of **constraint** that asserts that a column cannot contain any duplicate values. In terms of **relational** algebra, it is used to specify 1-to-1 relationships. For efficiency in checking whether a value can be inserted, (that is, the value does not already exist in the column), a unique constraint is supported by an underlying **unique index**.

See also constraint.

See also relational.

See also unique index.

unique index

An index on a column or set of columns that have a **unique constraint**. Because the index is known not to contain any duplicate values, certain kinds of lookups and count operations are more efficient than in the normal kind of index. Most of the lookups against this type of index are simply to determine if a certain value exists or not. The number of values in the index is the same as the number of rows in the table, or at least the number of rows with non-null values for the associated columns.

See also cardinality.

See also unique constraint.

See also unique key.

unique key

The set of columns (one or more) comprising a **unique index**. When you can define a `WHERE` condition that matches exactly one row, and the query can use an associated unique index, the lookup and error handling can be performed very efficiently.

See also cardinality.

See also unique constraint.

See also unique index.

V

victim

The transaction that is automatically chosen to be rolled back when a **deadlock** is detected. InnoDB rolls back the transaction that has updated the fewest rows.

See also deadlock.

See also deadlock detection.

See also innodb_lock_wait_timeout.

W

wait

When an operation, such as acquiring a **lock**, **mutex**, or **latch**, cannot be completed immediately, InnoDB pauses and tries again. The mechanism for pausing is elaborate enough that this operation has its own name, the **wait**. Individual threads are paused using a combination of internal InnoDB scheduling, operating system `wait()` calls, and short-duration **spin** loops.

On systems with heavy load and many transactions, you might use the output from the `SHOW INNODB STATUS` command to determine whether threads are spending too much time waiting, and if so, how you can improve **concurrency**.

See also concurrency.

See also latch.

See also lock.

See also mutex.

See also spin.

warm backup

A **backup** taken while the database is running, but that restricts some database operations during the backup process. For example, tables might become read-only. For busy applications and web sites, you might prefer a **hot backup**.

See also backup.

See also cold backup.

See also hot backup.

warm up

To run a system under a typical **workload** for some time after startup, so that the **buffer pool** and other memory regions are filled as they would be under normal conditions.

This process happens naturally over time when a MySQL server is restarted or subjected to a new workload. Starting in MySQL 5.6, you can speed up the warmup process by setting the configuration variables `innodb_buffer_pool_dump_at_shutdown=ON` and `innodb_buffer_pool_load_at_startup=ON`, to bring the contents of the buffer pool back into memory after a restart. Typically, you run a workload for some time to warm up the buffer pool before running performance tests, to ensure consistent results across multiple runs; otherwise, performance might be artificially low during the first run.

See also buffer pool.

See also workload.

Windows
: The built-in **InnoDB** storage engine and the InnoDB **Plugin** are supported on all the same Microsoft Windows versions as the MySQL server. The **MySQL Enterprise Backup** product has more comprehensive support for Windows systems than the **InnoDB Hot Backup** product that it supercedes.

  See also InnoDB.

  See also InnoDB Hot Backup.

  See also MySQL Enterprise Backup.

  See also plugin.

workload
: The combination and volume of **SQL** and other database operations, performed by a database application during typical or peak usage. You can subject the database to a particular workload during performance testing to identify **bottlenecks**, or during capacity planning.

  See also bottleneck.

  See also disk-bound.

  See also disk-bound.

  See also SQL.

write combining
: An optimization technique that reduces write operations when **dirty pages** are **flushed** from the InnoDB **buffer pool**. If a row in a page is updated multiple times, or multiple rows on the same page are updated, all of those changes are stored to the data files in a single write operation rather than one write for each change.

  See also buffer pool.

  See also dirty page.

  See also flush.

X

XA
: A standard interface for coordinating distributed **transactions**, allowing multiple databases to participate in a transaction while maintaining **ACID** compliance. For full details, see Section 12.3.7, “XA Transactions”.

  XA Distributed Transaction support is turned on by default. If you are not using this feature, note that it adds an extra fsync for each transaction, which may adversely affect performance.

  See also commit.

  See also transaction.

  See also two-phase commit.

Y

young
: A characteristic of a **page** in the `InnoDB` **buffer pool** meaning it has been accessed recently, and so is moved within the buffer pool data structure so that it will not be **flushed** soon by the **LRU** algorithm. This term is used in some **information schema** column names of tables related to the buffer pool.

  See also buffer pool.

  See also flush.

  See also INFORMATION_SCHEMA.

  See also LRU.

See also page.
